GLOBAL INVESTMENT IN HIV CURE RESEARCH AND DEVELOPMENT IN 2020

Towards an HIV Cure

RESOURCE TRACKING FOR HIV PREVENTION RESEARCH & DEVELOPMENT

JULY 2021
Antiretroviral treatment (ART) has radically changed the face of HIV infection, from a lethal disease into a manageable chronic condition.

All 38 million people currently living with HIV are eligible for ART based on the 2015 WHO Guidelines for ARVs for treatment and prevention — yet the latest data from December 2020 shows that only 28 million of these individuals are currently accessing ART. At the same time, daily antiretroviral regimens are costly and sometimes difficult for patients and most importantly not curative. HIV persists despite even the best treatment, and contributes to the development of non-AIDS morbidity.

As such, it is time to sustain our investments in the search for an HIV cure or remission. Over the last decade, our understanding and knowledge of the mechanisms of HIV persistence and latent viral reservoirs has greatly improved. Many members of the scientific community now agree that the search for a functional cure or remission for HIV/AIDS may be within reach. Indeed, the past year has seen important new developments and continued progress in the areas of cure and remission research:

- Continued advances in understanding the latency continuum that can contribute to developing better latency reversing agents and identify ways to permanently suppress the virus.
- Continued research into tools to quantify replication-competent virus.
- Continued progress in understanding how broadly neutralizing antibodies could be used alone, or in combination approaches, to HIV cure.
- Continued discussion and research around the use of analytic treatment interruption in HIV cure clinical trials.
- The advancement of long-acting agents including a new capsid inhibitor and long-acting injectable integrase inhibitor-based therapy.
- Proof of concept for a SMAC mimetic reversing latency in both a nonhuman primate and humanized mouse model. Continued research into SMAC mimetics to reverse latency.
- Advances in the understanding of elite controllers, specifically the characterization of “exceptional elite controllers”* - a very rare subset of people living with HIV who can spontaneously clear the virus.
- The death of Timothy Ray Brown, the first known person cured of HIV.
- The first potential case of HIV remission generated without the use of gene or cell therapy.
- Increased advancement of Adeno-Associated Virus (AAV) technology to produce durable production of broadly neutralizing antibodies in vivo.

The IAS Global Scientific Strategy: Towards an HIV Cure (2016), identifies the following scientific focal areas:

- Molecular biology of HIV latency and reversal strategies;
- Viral reservoirs, immunology of HIV persistence and ‘kill’ strategies;
- Models for HIV cure or sustainable remission;
- Paediatric HIV cure;
- Gene and cell therapy;
- Novel biomarkers and technologies to quantify and analyse HIV reservoirs;
- Social sciences and health system research.

Increased investments in these areas will aid in the search for an HIV cure, but can also contribute to increased knowledge of HIV pathogenesis and control, advances in the HIV vaccine field and benefit public health globally, such as finding innovative treatments for people with cancer, Alzheimer’s disease, other infectious diseases, and immune disorders.
INVESTMENT IN CURE RESEARCH:
IN 2020 WAS FLAT-FUNDED AS COMPARED TO 2019

Investment in Cure Research:
2019 shows a moderate increase in funding

In 2013, the IAS HIV Cure resource tracking group joined forces with AVAC to estimate global investments in HIV cure research. To date, this collaboration has yielded eight years of estimates for cure research investment from 2012 to 2020.

The Working Group estimates that in 2020, US$339.0 million was invested in cure research, representing a 1.0% increase over the US$334.5 million invested in 2020, and an increase of 274% over the US$88.1 million invested in 2012.

The majority of investments (US$323.4 million) came from the public sector with US$11.5 million invested by philanthropies such as amfAR, the Bill and Melinda Gates Foundation, AIDSfonds, Institut Pasteur, Wellcome Trust and the Campbell Foundation. Despite outreach by the Working Group, no company responded to the survey, whilst several companies are known to have active cure research programmes, resulting in a significant underestimation for commercial investment in cure research.
A GLOBAL STRATEGIC APPROACH TOWARDS AN HIV CURE may be within reach. Indeed, the past year has seen important changes in the search for a functional cure or remission for HIV/AIDS. Improved persistence and latent viral reservoirs have greatly improved. As such, it is time to sustain our investments in the search for treatment and prevention – yet the latest data from international and cross-disciplinary research cooperation. The advancement of long-acting agents including a new capsid inhibitor and long-acting injectable integrase inhibitor-based therapy. Proof of concept for a SMAC mimetic reversing latency controllers— a very rare subset of people living with HIV who can spontaneously clear the virus. The advancement of long-acting agents including a new capsid inhibitor and long-acting injectable integrase inhibitor-based therapy. Proof of concept for a SMAC mimetic reversing latency controllers—a very rare subset of people living with HIV who can spontaneously clear the virus.

Antiretroviral treatment (ART) has radically changed the face of HIV infection, from a condition.

Gene and cell therapy; Social sciences and health system research.

Increased advancement of Adeno-Associated Virus (AAV) technology to produce durable production of broadly competent virus.

Continued progress in understanding how broadly functional cure technologies work.

New research into tools to quantify replication-suppress the virus.

Increased investments in these areas will aid in the development of non-AIDS morbidity.

In 2020 was flat-funded as compared to 2019.
In 2020, the United States through the US National Institutes of Health contributed the majority of public funding, with Canadian Institutes of Health Research, National Health & Medical Research Council, the European Commission, California Institute for Regenerative Medicine, Research Foundation – Flanders, Federal Ministry of Education and Research, UNAIDS, Italian Ministry of Health, Istituto Superiore di Sanità and the UK Medical Research Council also being contributors to HIV cure research.

The successful implementation of the Global Scientific Strategy plan will require improved international scientific collaborative research teams and institutions at the international level to ensure an optimal use of resources. Active initiatives include:

- **IAS Towards an HIV cure initiative**
  The revised IAS Global Scientific Strategy: Towards an HIV Cure 2016, published in Nature Medicine, was launched in Durban at the AIDS 2016 conference.

- **Martin Delaney Collaboratories**
  The National Institutes of Health has awarded 300 researchers annual funding among six research collaborations working to advance basic medical science toward an HIV cure.

- **amfAR Countdown to a Cure for AIDS**
  amfAR focuses investments aimed at finding the scientific underpinnings of a cure.

- **NL4Cure**
  NL4Cure is a joint partnership coordinated by Aidsfonds between Dutch researchers and stakeholders that are committed to accelerating a cure for HIV. NL4Cure has developed a research agenda prior to identifying funding sources.

The inclusion of “cure” in the global response should not direct funding away from treatment, prevention and care programmes, or from biomedical research on HIV and its consequences, including vaccine and other prevention research. However, it is imperative that donors, governments and the AIDS community make a viable and sustained economic investment in HIV cure research.

**METHODOLOGY**

Data collection was undertaken by AVAC on behalf of the Resource Tracking for HIV Prevention R&D accessing public information and collecting information through direct appeals to funding agencies. Requests were made to the public, industry and philanthropic sector funders requesting information on cure research grants awarded in 2020 using the cure definition developed by the US National Institutes of Health’s Office of AIDS Research. In early 2021, surveys were sent to several dozen potential cure research funders across the globe. Responses from funders may not be comparable due to subjective determinations of whether specific grants fall within the OAR definition of cure research. Some funders also decline to provide information, and some did not always provide grant specific detail. In reviewing responses, AVAC accepted funders’ determination that specific research programs or grants are within the OAR definition.

- **US$ 288.8 million**
  - 273.6 United States
  - 1.4 France
  - 1.4 Canada
  - 1.0 European Union
  - 1.0 Italy
  - 0.7 The Netherlands
  - 0.5 Australia
  - 0.5 Switzerland
  - 0.3 Germany

- **US$ 323.9 million**
  - 296 United States
  - 4.9 Australia
  - 4.8 Canada
  - 4.6 European Union
  - 1.6 United Kingdom
  - 1.2 Spain
  - 0.6 Switzerland
  - 0.5 Italy
  - 0.4 The Netherlands
  - 0.2 Cuba

- **US$ 334.5 million**
  - 318.7 United States
  - 7.4 France
  - 4.0 Canada
  - 1.1 Australia
  - 1.0 Germany
  - 0.8 Switzerland
  - 0.7 United Kingdom
  - 0.3 Cuba

- **US$ 339.0 million**
  - 310.7 United States
  - 3.3 Canada
  - 3.0 Australia
  - 1.2 European Union
  - 1.1 Belgium
  - 1.1 United Kingdom
  - 0.7 Netherlands
  - 0.7 Switzerland
  - 0.6 Italy

**ACKNOWLEDGEMENTS**

The IAS Towards an HIV Cure initiative would like to thank Resource Tracking for HIV Prevention R&D, for which AVAC acts as Secretariat, and also includes the International AIDS Vaccine Initiative (IAVI) and the Joint United Nations Programme on HIV/AIDS (UNAIDS) as members.
