

Clinical Trial Design Considerations in HIV Remission Studies

Jintanat Ananworanich, MD, PhD

IAS HIV Cure & Cancer Forum
Paris, France

Key issues to consider

Populations

Design

ART interruption

Populations

- Early vs. Late treated
- Females
- Infants, children and adolescents
- Participants in resource-limited settings

Study Design

- Small exploratory vs. well powered study
- Composite endpoints
- Control arm vs. historic control
- Designs to accelerate
 - Common protocols to test different products of the same class over time (e.g. bNAbs, vaccines)

Evaluating HIV Remission Strategies with Treatment Interruption
