Secondly, the trained individuals facilitated the sessions with their peers still using substances, providing them a safe space for sharing and growth.
Lessons learned: Among the 15 AYALHIV attending group sessions, six ceased substance use, five reduced alcohol intake, while four dropped out. Key insights revealed that individuals with lived experiences enhance intervention design. Peer-led interventions are relatable, effective, and essential for group support, contributing to abstinence or reduced use. The involvement of peer counsellors and RoCs was vital for the pilot's success in addressing substance use challenges.
Conclusions/Next steps: Engaging AYALHIV with lived experiences is critical for designing effective substance use interventions. Peer counsellors act as relatable role models, aiding RoCs in overcoming substance use challenges. Training paraprofessionals helps bridge the mental health service gap in LMICs, facilitating the development of impactful interventions.

EP0793

Exploring the role of digital health services in supporting mental health and well-being among ageing people living with HIV in Hong Kong: a qualitative study

A.S.W. Chan[1], T. Wong[2], L.M. Leung[3]
[1]Hong Kong Baptist University, Department of Social Work, Hong Kong, Hong Kong, SAR of China, [2]Hong Kong AIDS Foundation, Hong Kong, Hong Kong, SAR of China, [3]The Hong Kong Polytechnic University, Department of Applied Social Sciences, Hong Kong, Hong Kong, SAR of China

Background: Ageing people living with HIV (PLWHIV) in Hong Kong face compounded challenges of stigma, mental health issues, and logistical barriers in traditional healthcare systems. These challenges often lead to isolation, anxiety, and depression. The rise of digital health technologies offers a promising solution by addressing age-related concerns, enhancing mental health support, and improving overall well-being.
This study aimed to explore the perceptions, needs, and expectations of digital health services among ageing PLWHIV. It sought to identify barriers in traditional healthcare, examine the potential of digital platforms to address mental health needs, and propose tailored interventions that promote resilience and reduce stigma.
Methods: This qualitative study explored perceptions, needs, and expectations of digital health services among ageing PLWHIV in Hong Kong. Researchers conducted in-depth interviews with 10 participants recruited through the Hong Kong AIDS Foundation. Interviews focused on traditional healthcare experiences, digital platform potential, and mental health needs. Participants included diverse age groups, with a third aged over 60 years and varying levels of medical consultation experience. Thematic analysis, conducted using NVivo software, identified recurring patterns and themes related to mental health and digital health interventions.
Results: Participants highlighted significant mental health challenges, including stigma, isolation, and inadequate support from traditional healthcare. Digital platforms were viewed as promising tools to address these issues by offering anonymous peer support, access to professional counseling, and better communication with providers. Older participants stressed the need for user-friendly interfaces and privacy protections to navigate digital systems effectively.
Additionally, digital tools could promote resilience by providing accessible health information, real-time updates on medical advancements, and tailored resources to enhance well-being. These platforms were recognized as a potential means to empower ageing PLWHIV, reduce stigma, and improve mental health outcomes.
Conclusions: Digital health solutions tailored for ageing PLWHIV can address mental health challenges by reducing stigma, fostering peer support, and promoting resilience. Platforms should prioritize user-friendly design, data security, and practical effectiveness to ensure widespread adoption and impact. These interventions have the potential to significantly improve the quality of life for this population.

EP0794

Exploring mental health challenges among adolescent girls and young women enrolled in an HIV prevention intervention in selected districts of Zimbabwe

K. Dube[1], N. Ndlovu[1], B. Nkomo[1], F.H. Mudzengerere[1], T. Masoka[1], D. Dhakwa[1], H.W. Mafaune[1], F. Mudokwani[1], E. Tachiwenyika[1], T. Tafuma[1], B. Madzima[2], M. Mutseta[3], T. Bhatasara[4]

[1]Zimbabwe Health Interventions, Harare, Zimbabwe, [2]National AIDS Council, Harare, Zimbabwe, [3]Ministry of Health and Child Care, Harare, Zimbabwe, [4]USAID Zimbabwe Mission, Harare, Zimbabwe

Background: Despite Zimbabwe having reached epidermic control, literature had shown that nearly 28% adolescent girls and young women (AGYW) aged 15-24 years' experience mental challenges. Causes of mental challenges among youths include psychosocial, economic hardships, drug and substance use, and health burdens among them the effects of the HIV pandemic. Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program which seeks to reduce HIV incidence among AGYW in 9 high HIV burden districts of Zimbabwe.

Mental health challenges among AGYW in HIV prevention interventions had not been explored. We assessed prevalence of mental health problems and response mechanisms among 10-19-year-old AGYW enrolled in the DREAMS program.

Methods: We conducted a descriptive cross-sectional study where routine program data for AGYW aged 10-19 years for October 2023 to September 2024 were extracted from the DREAMS online database DHIS2. Data were analysed using SPSS version 23 and Ms Excel generating frequencies, proportions, and measures of association between vulnerability to HIV and mental challenges. The assessment was approved by Medical Research Council of Zimbabwe (MRCZ/E/216).

Results: A total of 31,079 AGYW aged 10-19 years were assessed and of these 23% (7,148) reported having mental health challenges.

Nearly 40% (2,859/7,148) of those reported having mental challenges experienced sexual and physical violence, 8% misused alcohol and 2.1% (148/7,148) history of pregnancy.

About 41% of the AGYW who had mental challenges felt they had no one to confide with when worried or upset.

Over 86.7% (6,197/7,148) of AGYW who experienced mental health challenges accessed services like psychosocial support (PSS) through the DREAMS program.

Conclusions: AGYW in HIV prevention intervention experience mental health challenges and a majority were referred for and accessed services. Prevalence of mental health issues was high among 10-19 years AGYW who experienced sexual and physical violence as well as those who misused alcohol.

We recommend strengthening provision of mental health services combined with combination HIV prevention for AGYW in low resource settings.

EP0795

Identifying and addressing psychosocial needs of pregnant and breastfeeding women living with HIV referred for psychosocial services at health facilities supported by Baylor Foundation Malawi

V. Banda[1], A. Mazenga[1], F. Tembo[1], W. Khunga[1], E. Wetzel[1,2], M.M. Udedi[3], K.R. Simon[1,2], C.M. Cox[1,2]

[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]Baylor College of Medicine, Houston, United States, [3]Ministry of Health, Curative and Medical Rehabilitation Services – NCDs & Mental Health, Lilongwe, Malawi

Background: People living with HIV often have unmet psychosocial needs impacting their ability to take daily antiretroviral therapy and leading to unsuppressed viral load. Pregnant and breastfeeding women living with HIV (PBFWH) often have additional unmet needs, yet achieving viral suppression is critical for their own health and to prevent HIV transmission to their infants.

In resource-limited settings, access to psychosocial counselors (PSC) is limited. Baylor Foundation-Malawi provides psychosocial counseling to people attending 96 health facilities in five districts in Malawi. We describe PBFWH receiving psychosocial support.

Methods: Phone-based and in-person PSC visits were provided to PBFWH referred by health workers or self-referred. Women newly diagnosed with HIV, with treatment interruptions, detectable viral loads, mental health concerns, or requesting counseling were referred either in person or via WhatsApp group from the facility phone using anonymous client information. The 18 PSCs at high volume facilities attended to referred women from all facilities.

Client needs were categorized as **ART-related** (e.g. adherence, side effects), **psychological** (e.g. depression, abuse, anxiety), or **social support** (e.g. relationship challenges, housing, food insecurity, transport). Routine program data was analysed.

Results: From February 2023 to February 2024, 3,906 PSC counseling sessions with PBFWH were completed, representing 14% of all PSC sessions (3,906/29,440). Most sessions (n=3,108, 80%) were conducted remotely by phone, and 39% (n=1,527) were with adolescent girls and young women, 10–24 years.

Referral reasons included new HIV diagnosis (37%), treatment interruption (29%), high viral load (18%), gender-based violence (8%), mental health issues (4%), relationship concerns (3%), and AGYW (1%). Among all visits with PBFWH, 88% (n=3,433) had identified psychosocial needs, with 45% (n=1,545) psychological; 32.5% (n=1116) social and 22.5% (n=772) ART-related.

Among women with psychological needs, 11.5% (n=178) were diagnosed with depression or other mental health needs including suicidality; all were referred urgently for clinical evaluation and treatment.

Conclusions: Phone-based counseling facilitated access to psychosocial support for PBFWH from remote health facilities. Next steps include assessment of viral suppression outcomes among PBFWH who received PSC support.

EP0796

Coping mechanisms to depressive symptoms among young people living with HIV in Homabay County, Kenya

J. Ndimbii[1]
[1]Student at Mount Kenya University, Nairobi, Kenya

Background: Prevalence of depression among young people living with HIV (YPLHIV) is documented to be high, compared to those who are not living with HIV. Being young and living with a chronic illness may result in either adaptive or maladaptive coping responses. Studies have shown that those who use maladaptive coping mechanisms are likely to have worse mental health outcomes.
This study sought to understand the coping mechanims used by YPLHIV in Homabay county in Kenya.
Methods: This was an analytical, cross sectional study incorporating in-depth interveiws conducted in Homabay county, Kenya among YPLHIV 18-24 years. 346 participants were recruited from twelve health facilities, randomly selected, and proportional allocation used to determine number of participants per facility.
Participants were randomly selected until sample threshold for the facility was met. A quantitative questionnaire collected demographics, incorporated depression screening using the patient health questionnaire (PHQ-9), assessed for coping and perceived social support. Nine in-depth interviews were conducted with a sub-set of those who scored moderate or severe on the PHQ-9.
Quantitative data was analyzed using descriptive and inferential statistics, while qualitative data was analyzed for emerging themes.
Results: Mean age was 21 years, 63% were female. 30.3% were students, 18.2% were on treatment for a year or less. 73.7% were intiated on treatment immediately after testing, and 91.4% were on a dolutegravir-based treatment with 88.2% indicated to have good adherence. 62.7% had ever been refered for adherence counseling, 61.6% had undetectable viral load.
Prevalence of depressive symptoms was 14.5% with high scores for suicidal ideation and feeling bad about self.
There was a significant relationship between the PHQ-9 score and avodiant coping $x^2(3, N=345)=37.509$, exact p= <.001) with 47.1% of those who scored moderate to severe on the PHQ-9 having a medium scoring for avoidant coping.
The analysis showed a significant relationship between PHQ-9 score and problem focused coping style $x^2(3, N=345)=25.707$,p= <.001). In-depth interviews reported maladaptive coping to stressors such as withdrawal, and thoughts of self harm.
Conclusions: Empowerment of YPLHIV to use adaptive coping for stressors through locally adaptable responses including enhanced adherence counseling and psychosocial support groups.

EP0797

Integrating mental health interventions into HIV care for rural communities in Kenya: addressing barriers and improving outcomes

R. Makenywa[1], G.M. Karoki[2], E. Githaiga[3]
[1]Ambassadors of Change NGO, Human Rights/Programs, Nakuru, Kenya, [2]Kenya Pipeline, Engeenering, Nakuru, Kenya, [3]Bliss Women and Children Org, Programs, Nakuru, Kenya

Background: Mental health challenges, such as depression, anxiety, are prevalent among people (PLHIV) and are often exacerbated by stigma, poverty, & limited access to care in rural areas. These challenges negatively impact adherence to antiretroviral therapy (ART) and engagement with HIV care, contributing to poor health outcomes. Despite growing recognition of the importance of mental health in HIV care, there is limited integration of mental health services into HIV programs, particularly in rural settings.
Description: This study examines the effectiveness of community-driven interventions aimed at integrating mental health services into HIV care in rural Kenya. Key interventions included training community health workers to provide basic mental health counseling, establishing peer support groups, and implementing mobile-based mental health screening tools to identify high-risk individuals. Data were collected from 500 PLHIV across three rural counties through surveys and focus group discussions over 12 months.
Lessons learned: Preliminary findings indicate a 40% reduction in symptoms of depression and anxiety among participants engaged in the interventions. ART adherence rates improved from 70% to 85% over the study period.
Participants reported increased access to mental health resources and a reduction in stigma associated with HIV and mental health issues. Peer support groups were particularly effective in fostering social connections and emotional resilience.
Conclusions/Next steps: Integrating mental health services into HIV care in rural communities can significantly improve health outcomes for PLHIV. Community-based approaches, such as task-shifting to community health workers and leveraging mobile technologies, are scalable and cost-effective solutions.
To maximize impact, policymakers should prioritize mental health as a core component of HIV care, particularly in underserved areas.

EP0798

A systematic review and meta-analysis of the prevalence and determinants of HIV-associated neurocognitive disorders in people living with HIV in Africa

U. Chima[1], J. Onyehalu[1], A. Ngige[1], C. Nwachuya[1], C. Agbo[1], C. Nwankwo[1], A. Uche[1], J. Agbo[2], C. Agbo[3], A. Isah[1]

[1]Person-Centered HIV Research Team, Department of Clinical Pharmacy and Pharmacy Management, University of Nigeria, Nsukka, Nigeria, [2]Enugu State University of Science and Technology Teaching Hospital, Parklane, Enugu, Nigeria, [3]Federal Road Safety Corporation Clinic, Department of Clinical Pharmacy and Pharmacy Management, University of Nigeria, Federal Capital Territory, Nigeria

Background: HIV-associated neurocognitive disorders (HAND) are common among people living with HIV in Africa, affecting medication adherence, daily functioning, and quality of life. The high HIV burden and limited healthcare resources in the region increase the risk of HAND. While many studies have investigated HAND prevalence in African countries, comprehensive region-wide evidence is lacking. This systematic review and meta-analysis aim to estimate the prevalence and determinants of HAND in Africa, addressing this gap.

Methods: Following PRISMA guidelines, we conducted a systematic review and meta-analysis of studies assessing HAND prevalence in Africa. Data were sourced from Scopus, Web of Science, PubMed, and Google Scholar, with manual searches of reference lists from included studies. A random-effects model in R calculated the pooled prevalence of HAND. Heterogeneity was assessed using the I^2 statistic, and subgroup analyses were conducted by country and diagnostic criteria. Publication bias was evaluated with Egger's test.

Results: Of the 2,721 articles screened, 38 were included. The overall prevalence of HAND among people living with HIV in Africa was estimated at 48.5% (95% CI: 40.5, 56.5) with significant heterogeneity (I^2 = 97.03%, τ^2 = 0.062, p ≤ 0.001). The highest prevalence was in Kenya at 78.79% (95% CI: 60.17, 97.40), while the lowest was in the Central African Republic at 25.00% (95% CI: 16.51, 33.49). Using different diagnostic criteria, the highest average prevalence was recorded with the International HIV Dementia Scale (IHDS) at 52.5%, followed by the Frascati criteria at 47.5%, the Montreal Cognitive Assessment (MoCA) at 47.0%, and the Global Dementia Scale (GDS) at 32.6%. Twelve studies identified HAND determinants, showing that older age (n = 6), low education level (n = 4), and advanced clinical disease stage (n = 3) increased the risk of HAND by 3.21, 4.50, and 4.45 times, respectively. No publication bias was detected.

Conclusions: The high prevalence of HAND in Africa is mainly influenced by older age, advanced disease stages, and lower education levels. Implementing health education, early HIV screening, and training health professionals on HAND in hospitals are crucial public health interventions for people living with HIV.

EP0799

Caring for the caregivers: preliminary findings from a pilot intervention to address well-being and stigma among healthcare workers providing HIV services in Zambézia Province, Mozambique

E. Graves[1], C. De Schacht[2], P. Paulo[2], V. Cumbe[3], F. Mambo Jr.[4], H.L. Brooks[1], R. Fernando[4], T. Oyekunle[5], C.M. Audet[5,1]

[1]Vanderbilt University Medical Center, Vanderbilt Institute for Global Health, Nashville, United States, [2]Centro pela Saúde Global (C-Saúde), Evaluations Department, Maputo, Mozambique, [3]Central Hospital Beira, Department of Psychiatry, Beira, Mozambique, [4]Centro pela Saúde Global (C-Saúde), Evaluations Department, Quelimane, Mozambique, [5]Vanderbilt University Medical Center, Department of Health Policy, Nashville, United States

Background: Healthcare workers (HCW) are at high risk of exhaustion and burnout. A pilot intervention to improve resilience and decrease stigma was implemented from January-June 2024 in Zambézia Province, Mozambique.

Methods: Four health facilities were randomly assigned to receive a resilience intervention, an anti-stigma intervention, both interventions, or be comparison. Biweekly resilience (focus: burnout, self-care, teamwork, work-life balance) and anti-stigma (focus: stigma, communication, humanization) sessions were facilitated by a licensed psychologist from February-April 2024.

Surveys (baseline, endline) were conducted with 90 HCW to evaluate the interventions' impact on psychosocial measures of burnout (Copenhagen Burnout Inventory), depersonalization (one-item measure), resilience (Early Warning Resilience Survey, decompression and activation factors), and HIV stigma (blame/judgement and interpersonal/social distancing factors).

Multivariable models were adjusted for inter-site correlation, as well as sex, work category and length of time as HCW, using linear mixed modeling. In-depth interviews were conducted with sub-group of HCW intervention participants. Thematic analysis was used to explore perceptions and suggestions.

Results: Participants (n=90) were predominantly female (62%), married/partnered (70%), and median age was 34 years. There were no statistically significant changes seen in scores for overall burnout, personal-, work- or client-related burnout, depersonalization, resilience or stigma. Participation in anti-stigma intervention was associated with a change in work-related burnout score (p=0.033) in the multivariable model; no other associations found.

Participation in resilience intervention was not associated with changes in overall burnout, personal-, work-, or client-related burnout, depersonalization, or resilience scores. However, the intervention showed a trend towards an association with changes in resilience score in the multivariable model, though not statistically significant (p=0.065).

Participants favored a continuation for both types of intervention which they perceived as supportive, educational and acceptable methods for providing reinforcement for HCW well-being and workplace interactions.

Conclusions: Neither of our novel interventions showed significant improvement in overall burnout, depersonalization, resilience or stigma among HCW participants. Nevertheless, significant improvement seen in work-related burnout scores and positive trends in resilience scores, together with favorable HCW acceptability of the interventions, suggest continued investigation to identify optimal components for effectively increasing HCW resilience and reducing stigma, particularly for those providing care in resource-constrained setting such as Mozambique.

EP0800

Psychological burdens of adolescents living with HIV in Indonesia: depression symptoms and the need for tailored mental health support

G.V. Simanullang[1,2,3]
[1]Atma Jaya Catholic University of Indonesia, University Center of Excellence - HIV AIDS Research Center Health Policy and Social Innovation, Jakarta, Indonesia, [2]Atma Jaya Catholic University of Indonesia, Faculty of Psychology, Jakarta, Indonesia, [3]University of Illinois at Chicago (UIC) - School of Public Health, Chicago, United States

Background: Adolescents Living with HIV (ALWH) face various psychosocial and behavioral challenges due to the developmental stages of human maturation accompanied by the challenges of coping with HIV as a stigmatizing illness that pose a range of potential psychological challenges to the ALWH.
Yet, HIV studies focusing on emotional health including depression symptoms among them are sparce along with a notable absence of culturally adapted, context-specific recommendations for such youth in low middle-income countries including Indonesia.
This study investigates the symptoms of depression among ALWH in Indonesia.
Methods: This cross-sectional study enrolled 143 ALWH ages 13-18 living with HIV in seven cities in Indonesia who have been told about their HIV serostatus. The youth were referred by local HIV nongovernment organizations in each city. The youth's self-reported symptoms of depression was measured through face-to-face interviews using the Patient Health Questionnaire (PHQ)-9.
Results: Participants' averaged 15.9 years of age with 55.94% of participants were girls. Of the 143 participants, slightly less than half (45.5%) reported symptoms of moderate to severe depression in the past two weeks.
The most frequently reported symptoms were sleep disturbances, appetite/eating problems, and trouble concentrating.
The overall rate of suicidal ideation of participants in this study was 15.38%, with a higher rate of frequency found among participants who were acquired at adolescence (19.35%) than perinatally (14.29%).
The selected model in multivariate analyses showed that girls, becoming infected with HIV through risky behavior, taking ARV infrequently, and having more threatening perceptions of HIV reported greater level of depression symptoms.
Conclusions: As possibly the first studies of ALWH in Indonesia that examine depression symptoms and factors related to it, the study's results suggested the importance of developing mental health support and culturally tailored services for ALWH, particularly to reduce depression symptoms by incorporating the factors contributing to it. HIV programs for ALWH could include strategies that reduce adolescents' negative perception of HIV, routine mental health screening, provide them psychological and social support, and help them in identifying and adopting effective coping methods, and build resilience in overcoming the possible adversities of illness and successfully confronting the challenges of living with HIV.

EP0801

Feasibility and acceptability of KP led mental health support

S. Zitha[1], S. Musemburi[2], P. Matambanadzo[1]
[1]Centre for Sexual Health HIV/AIDS, Zimbabwe, KP Programme, Harare, Zimbabwe, [2]Centre for Sexual Health HIV/AIDS, Zimbabwe, Harare, Zimbabwe

Background: WHO estimates that 5% of adults globally suffer from depression and data from Responded Driven Surveys (RDS) conducted between 2016 and 2017 show prevalence of between 41-48% of common mental disorders (CMDs) amongst female sex workers in Zimbabwe. Key Populations (KPs) suffer from depression due to their increased exposure to risk factors like violence, discrimination and stigmatization and this may affect their health outcomes. To address this challenge, we sought to offer in our health facilities and in the community, KP led mental health services that are feasible, acceptable and sustainable.
Methods: We quantitatively analysed program data spanning over three years (2022 to 2024) in the friendship bench server from five KP districts in Zimbabwe collected by 44 KP Lay counsellors trained to administer the Shona Symptom Questionnaire (SSQ) to screen for CMDs.
We analysed the number of sessions conducted by Lay counsellors, recorded reasons for each visit to the Lay counsellor, each KPs SSQ score, number of repeat sessions and number of red flags referred for further support.
Results: Between January 2022 and September 2024, 15 570 KPs were screened for CMDs by Lay Counsellors. The majority (65%) of KPs were seen at the facility or Drop-in Centre, 28% were seen in the community and the rest received virtual support.
Of those seeking mental health services, 40% where below the age of 25 and 90% where Female Sex Workers. KPs who recorded a SSQ score of above 8 were 59% and proceeded to receive counselling sessions and support services specific to their needs.
Conclusions: Our KP led model of integrating mental health and HIV services tailored to the specific needs of KPs is feasible, reduces symptoms of CMDs, improves health outcomes while ensuring that their mental health challenges are adequately addressed. Adopting innovative ways to diagnose and address mental health challenges among KPs is key to ending AIDS. This model is

sustainable, has potential to increase uptake of health services and improve retention of KPs in HIV prevention, treatment and care programmes.

EP0802

Body Mapping: using arts-based methods to address psychosocial trauma and stigma in marginalised heterosexual people living with HIV from cultural and linguistically diverse (CALD) backgrounds in Greater Western Sydney, Australia

P. Njeri[1], J. Costello[1], A. Heslop[1], P. Schlosser[1]
[1]Private, Australia

Background: Complex psychosocial trauma and multi-dimensional stigma associated with HIV diagnosis and/or living longer-term with HIV is common and still experienced by marginalised communities of people living with HIV (PLHIV) in Australia, particularly those identifying as heterosexual. This can impact on decreased rates of retention in care, treatment adherence and viral suppression, and poorer awareness and engagement with peer navigation programs, mental health and well-being outcomes.
Arts-based research methods allow those from marginalised populations to safely explore and interpret difficult emotions and experiences, create a therapeutic effect by focusing on strength and resilience, and reduce self and perceived-stigma.
Description: Positive Life NSW (PLNSW) facilitated a structured body mapping workshop for 18 participants from CALD backgrounds/living long-term with HIV to address psychosocial issues experienced by heterosexually identifying PLHIV in Greater Western Sydney in April 2023.
Body mapping involves tracing around a person's body to create a life-sized outline which is filled in during a creative, reflective process using mixed media to represent and express personal, embodied experiences.
Two body mapping practitioners, an artist and a psychotherapist provided a safe, supportive environment for participants to express through art their past and future selves, whilst working towards reducing perceived and self-stigma, creating self-acceptance, and improving overall quality of life (QoL).
Lessons learned: PLNSW's previous community engagement strategies observed compounded trauma, perceived/self-stigma were preventing heterosexual PLHIV from moving forward with their lives post-diagnosis. Feelings of loss, grief, and fear of separation from cultural communities due to shame contributed to social isolation and poorer health, mental, sexual and physical health outcomes. The workshop was developed to assist this group with 'seeing beyond' their diagnosis using self-reflection techniques. Participants' feedback was overwhelmingly positive with most preferring a longer workshop. Critical knowledge was imparted by the external body mapping practitioners, allowing the workshop to be developed by and for community in the future.
Conclusions/Next steps: Participants stated they found the body mapping process to be cathartic and life-changing, and many became more meaningfully engaged with their communities utilising techniques learned. Overall, self-reflection fostered more positive relationships, improved physical and mental health outcomes leading to reductions in self-stigma and better QoL.

EP0803

Correlates of poor mental health among Jamaican sexual minority men living with HIV

O. Harris[1], J. Egbunike[1], P. Agbadi[2], X. Biggs[3], K. Walton-Levermore[1], S. Beckford Jarrett[4], M. Johnson[4], T. Neilands[4], A. Stewart[5], C. Dawson-Rose[1], S. Weiser[4]
[1]University of California, San Francisco, School of Nursing, Community Health System, San Francisco, United States, [2]James Cook University, Brisbane, Austria, [3]Jamaica AIDS Support for Life, Kingston, Jamaica, [4]University of California, San Francisco, Department of Medicine, San Francisco, United States, [5]Univeristy of California, Institute for Health and Aging, San Francisco, United States

Background: Sexual and gender minorities (SGM) in Jamaica experience disparate rates of stigma, violence, and poor mental health. Jamaica has one of the highest HIV prevalence among SGM in the Caribbean, with a prevalence of 33% among sexual minority men (SMM) and an alarming 51% among transgender women (TW) compared to 1.8% in the general population. Within this context of high HIV prevalence and poor treatment outcomes, data suggest higher rates of depression and anxiety among SGM, with a large majority of TW reporting symptoms that are indicative of poor mental health. Therefore, research is needed to explore the interplay between intersectional stigma, violence, mental health, and HIV care engagement among this population.
Thus, the purpose of this study is to examine the drivers of poor mental health among Jamaican SMM living with HIV who are currently engaged in care.
Methods: We conducted a cross-sectional survey among a sample of 350 sexual and gender minorities living with HIV in Jamaica. Participants were recruited from a community-based organization operating three HIV clinics islandwide between January and May 2024. Data analysis included summary statistics and multiple linear regression using STATA version 18.
Results: Participants ranged in age from 18 to 71 years (mean age of 33). The majority of the sample identified as male (90%), not college educated (70%), identified with a religion (84%), and made less than $100k JMD per year (66%).
We developed an integrated framework to examine individual, environmental, and sociodemographic risk factors for loneliness, depression, anxiety, and anxiety-related sleeplessness among SMM living with HIV in Jamaica.
Negative self-image was a significant individual-level risk factor for loneliness, depression, and anxiety. Adverse childhood experiences were a significant environmental risk factor for these outcomes and anxiety-related sleeplessness. Regarding sociodemographic factors, SMM aged 18–24 years and 25–34 years were at higher risk of loneliness, depression, and anxiety compared to those aged 35 years and older.

Conclusions: Our results show multiple factors influencing loneliness, depression, anxiety, and anxiety-related sleeplessness among Jamaican SMM.
Our findings also highlight the urgency for both individual and structural-level interventions to address the mental health needs of SMM living with HIV.

Gender, sexuality and sexual cultures: Meanings, identities, norms and interventions

EP0804
Quality of life of among ageing women living with HIV/AIDS in West Bengal, India

M. Biswas[1]
[1]*Jawaharlal Nehru University, Centre for the Study of Regional Development, New Delhi, India*

Background: Several effective ART interventions have increased the life expectancy of people living with HIV/AIDS (PLHA), where PLHA experience more morbidity and mortality than others. The age-specific illnesses and disorders related to cancers, mental or psychological diseases, cardiovascular diseases, bone issues, and other geriatric syndromes greatly alter and affect their well-being.
This paper aims to investigate the emerging issues of women while ageing with HIV/AIDS in West Bengal, India. These issues are co-related with various gender inequalities and inequities that dominate the lives of women in the region.
These structural variants hinder identification, diagnosis, and access to healthcare services, which significantly impairs the quality of life of these women.
Methods: About 31 women aged 45 years and above who were living and ageing with HIV participated in the study during 2023-24. For statistical investigation, an Interpretative Phenomenological method was used to investigate and interpret their narratives. The self-accounts of participants were not seen as revealing any generic 'truth'; rather, they were treated as stories whose meanings are situationnally located and require to be explored. The results showed in themes and sub-themes, with qualitative- illustrations.
Results: The results revealed that women were more likely to be invisible and isolated, keeping their status hidden from social ecology, which resulted in the shrinking of their social network and, thereby, an increase in their emotional disconnect.
They were afraid to disclose their HIV status because of the stigma and discrimination surrounding the illness in the local- communities.
Most of these women reported early onset of age-specific and other- geriatric disorders like osteoporosis, cardiovascular issues and mental health disorders, but they preferred not to visit healthcare settings for fear of disclosure. They also majorly reported loneliness and isolation. The altered and ageing immune system was postponed and increased the burden of illnesses, which had negatively affected their health trajectory and reduced their quality of life and well-being.
Conclusions: The findings of this study reinforced that increasing complications of care for PLHA need to be addressed through effective evidence-based interventions to enhance the quality of life among WLHA after adhering to ART therapy in West Bengal, India.

EP0805
The impact of stigma and socioeconomic barriers on HIV treatment adherence in Conakry, Republic of Guinea: a gender perspective

A. Doro Altan[1], F. Ciccacci[2], M.R. Tounkara[3], A.B. Sylla[3], C. Mosconi[2], C. De Santo[2], M. Cicala[2], C. Cannelli[4], S. Orlando[2]
[1]*Link Campus University, Rome, Italy,* [2]*University of Rome Torvergata, Biomedicine and Prevention, Rome, Italy,* [3]*DREAM Program, Community of Sant'Egidio, Conaky, Guinea,* [4]*DREAM Program, Community of Sant'Egidio, Rome, Italy*

Background: HIV remains a significant global health challenge, with sub-Saharan Africa most affected. In West Africa, including Guinea, adherence to antiretroviral therapy (ART) and retention in care face challenges due to stigma, socioeconomic barriers, and limited healthcare access.
This study investigates ART adherence determinants and stigma's impact on people living with HIV (PLHIV) in Conakry, focusing on gender differences.
Methods: A cross-sectional study was conducted in four DREAM Centers in Guinea. Data were collected using a questionnaire on relationship with healthcare services, adherence to treatment, experiences of stigma, and socio-demographic characteristics.
Adherence was measured using the Morisky Medication Adherence Scale, and stigma was assessed using a modified HIV Stigma Scale.
Results: During the study, 472 patients met inclusion criteria, with 70 refusing participation; 402 were included, 82% female and 18% male, with a median age of 32 years (IQR: 27–40). Of these, 82% were actively in care, and 18% re-engaged after treatment interruption. Education levels were 37% illiterate and 63% educated, with 91% employed. Median travel time to the DREAM center was 1 hour (IQR: 0.75–2), and 42% reported high stigma.
Patients re-engaging in care lived farther from the center (median: 2 vs. 1 hour, OR 1.18, $p = 0.038$) and had lower adherence rates (32% vs. 78%, OR 0.14, $p < 0.001$). Lower adherence was linked to longer time in therapy (82% vs. 96%, COR 0.19, $p < 0.001$). Higher adherence correlated with greater trust in treatment (99.6% vs. 77%, COR 42, $p < 0.001$), living with children (59% vs. 41%, COR 1.93, $p = 0.004$), and lower stigma (34% vs. 55%, OR 0.55, $p = 0.011$). Among men, stigma was the primary factor for low adherence (OR 0.32, $p = 0.05$), while for women, adherence was associated with shorter time in care, higher trust in treatment, and having children (AOR 0.22, $p = 0.001$; AOR 38.5, $p < 0.001$; AOR 2.09, $p = 0.004$).

Conclusions: Stigma and healthcare access are critical barriers to adherence among PLHIV. Gender-specific differences suggest that tailored interventions are needed to address these unique challenges.

EP0806

Depression and sexual addiction among transgender women in China

J. Lu[1], X. Wu[1], G. Wu[1], L. Xu[2], Y. Wang[2], Y. Cai[2], H. Zou[1]
[1]Fudan University, School of Public Health, Shanghai, China, [2]Shanghai Jiao Tong University School of Medicine, School of Public Health, Shanghai, China

Background: Depression is prevalent among transgender women, leading to various negative consequences. Sexual addiction can lead to interpersonal conflict, social and occupational issues, psychological distress, and financial problems. Our study aimed to investigate the relationship between depression and sexual addiction in transgender women.
Methods: This cross-sectional study was conducted from October 2017 to December 2019 in Shenyang, China. Sexual addiction was measured using the Sexual Compulsivity Scale (SCS), and depression severity was assessed using the Patient Health Questionnaire (PHQ-9). Multiple linear regression analysis was used to assess the association between depression and sexual addiction in transgender women.
Model 1 did not adjust for any variables;
Model 2 adjusted for sociodemographic variables (age, education level, marital status, income, residence, smoking);
Model 3 further adjusted for sexual characteristic variables (sexual orientation, alcohol consumption frequency before sexual behavior, drug use, verbal violence, sexual violence, willingness for VCT, HIV status).
Results: Our study included 423 transgender women, of whom 60.05% reported varying degrees of depression .The average score for sexual addiction among transgender women was 21.57 ± 5.90. The study found a positive correlation between different levels of depression and sexual addiction.
Compared to transgender women without depression, those reporting mild (β = 3.16; 95% CI: 1.96-4.37; P < 0.001), moderate (β = 4.12; 95% CI: 2.58-5.67; P < 0.001), and severe (β = 7.46; 95% CI: 5.59-9.32; P < 0.001) depression had higher sexual addiction scores. The association remained significant after adjusting for Model 2 and Model 3, although the effect size decreased and was consistent across all depression levels.
Conclusions: A statistically significant positive correlation is found between depression severity and sexual addiction. The worsening of depressive symptoms is closely associated with an increase in sexual addictive behaviors, with transgender women reporting mild to severe depression showing higher levels of sexual addiction.
After adjusting for sociodemographic and sexual characteristic factors, this relationship remains significant, although the effect size is reduced. These findings suggest that mental health issues in transgender women may be an important factor influencing sexual addiction. Future research should emphasize the integrated consideration of mental health interventions and sexual behavior management in transgender women.

EP0807

Exploring gender differences in food security and nutrition vulnerability among people living with HIV in East Africa

I. Omondi[1], G. Giordana[1]
[1]World Food Programme, Nutrition, Nairobi, Kenya

Background: Food and nutrition security are critical for achieving positive health outcomes, particularly among People Living with HIV (PLHIV) in the East African Region. While country-specific evidence on food security and nutrition vulnerability among HIV-affected households exists, regional-level evidence remains scarce.
In 2024, the World Food Programme (WFP) initiated an exercise to generate a regional synthesis based on existing data on food security, nutrition, and socio-economic vulnerability across six East African countries.
Methods: This review analyses food security, nutrition, and socio-economic vulnerability assessments conducted by WFP in partnership with UNAIDS and relevant ministries over the past decade in six East African countries: Kenya, Somalia, South Sudan, Rwanda, Burundi, and Djibouti. These cross-sectional studies targeted PLHIV undergoing treatment. Cleaned quantitative datasets from these studies were reviewed and analysed using SPSS V20 to identify cross-cutting data points. A total of 7,058 study respondents were included in the analysis. Descriptive statistics (frequencies, means) and crosstabulations were used to examine the relationships between gender and food security, nutrition, and socio-economic factors among PLHIV and their households.
Results: The gender distribution across the countries under review showed a higher representation of women (69%) compared to men (31%). Food Consumption Score (FCS) analysis revealed that 35% of HIV-affected households headed by women had a poor FCS, which is 7% higher than that observed in male-headed households. Undernutrition was more prevalent among males (30.4%, n=637) than females (22.1%, n=976), while overnutrition was more common in females (23.1%, n=1019) compared to males (10.4%, n=218). Additionally, 68% of men (n=1714) reported having access to formal education, a higher proportion compared to women (64%, n=2914).
Conclusions: At the regional level, women living with HIV are especially vulnerable, reflecting the added impact of gender disparities and social marginalization. While each country's context differs, the synthesis highlights a shared pattern: when HIV intersects with resource scarcity, fragile health systems, and pervasive inequality, food insecurity and malnutrition are further exacerbated. A holistic, gender-transformative approach is crucial to address the specific needs of women living with HIV in East Africa.

EP0808

Community-centered strategies for trans people living with HIV: promoting whole-person care and social equity

M. Romero[1]
[1]*Centro de Documentación y Situación Trans de América Latina y el Caribe (CeDoSTALC), Buenos Aires, Argentina*

Background: Trans people living with HIV in Latin America and the Caribbean face structural barriers to accessing health care, including pervasive stigma, discrimination, and socioeconomic challenges. These factors contribute to poor health outcomes and low adherence to antiretroviral therapy (ART). In response, RedLacTrans, in partnership with CeDoSTALC, has developed community-driven interventions to address these challenges.
The program aims to foster safe, inclusive, and empowering environments that enhance ART adherence and overall well-being for trans populations.
Description: The program, implemented across various countries in Latin America and the Caribbean, centers on trans-led, community-based initiatives that integrate social and behavioral sciences into HIV care. Key activities include peer-led health promotion, psychosocial support, and the creation of gender-affirming spaces to reduce stigma and build trust. By addressing structural barriers such as food insecurity and mental health disparities, the program ensures a holistic approach to care.
Leadership development among trans individuals is a core component, empowering communities to drive their own health outcomes while advocating for systemic change.
Lessons learned: Findings from CeDoSTALC confirm that community-centered interventions significantly improve treatment adherence. Trans people who receive care in affirming and supportive environments demonstrate greater trust in health systems, leading to higher ART adherence rates and improved quality of life.
The incorporation of peer-led models fosters a sense of community ownership and reduces the isolation often experienced by trans people living with HIV.
These strategies also highlight the importance of integrating gender-affirming care into HIV services, which has a measurable positive impact on mental health and treatment outcomes.
Conclusions/Next steps: Community-driven interventions represent a scalable and replicable model for improving health outcomes among trans people living with HIV. The program's success underscores the importance of centering the voices and leadership of trans populations in the design and implementation of health services.
Future efforts will focus on expanding these initiatives to additional regions, deepening the integration of mental health and gender-affirming care, and addressing broader structural determinants of health to ensure sustainability and equity in HIV care.

EP0809

Factors associated with disclosure of sexual orientation and behaviors among gay, bisexual and other men who have sex with men (GBM) in Mumbai, India

V. V. Patel[1], E. O'Neill[1], N. Mutyala[2], J. Chaudary[2], V. Chakrapani[3,2]
[1]*Albert Einstein College of Medicine, Division of General Internal Medicine, Bronx, United States,* [2]*The Humsafar Trust, Mumbai, India,* [3]*Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India*

Background: Non-disclosure of sexual orientation (i.e., outness) can negatively impact the well-being of gay, bisexual, and other men who have sex with men (GBM), hinder access to support and health services, and influence HIV risk. Understanding factors associated with outness is crucial to developing effective interventions, but little is known on this topic for GBM in India.
This study examined factors associated with disclosure among GBM enrolled in a virtual intervention in India.
Methods: We analyzed baseline survey data from 1,004 GBM (aged 18+) in Mumbai, India recruited from online platforms and enrolled in a mHealth randomized trial between April 2022-December 2024.
Guided by the minority stress and disclosure process theories, we examined three disclosure outcomes using separate logistic regressions:
1. Out to someone,
2. Out to LGBTQ+ individuals, and;
3. Out to everyone.
Reported as adjusted odds ratio [95% CI], factors examined included sociodemographic characteristics, internalized homonegativity ('self-stigma') and HIV related risk: HIV testing history, condom use, and risky alcohol use (AUDIT-C).
Results: Participants' median age was 27 (IQR 23-32) and 29% had low-income (USD<$119/month). 64% were out to someone, 43% were out to LGBTQ individual(s), and 21% were out to everyone (not mutually exclusive).
Multivariable analyses showed that in all three different outness models, disclosure was associated with always using condoms but increased risky alcohol use, and less likely among older participants, those with lower income, less education, and heterosexual identity (versus gay/queer identities), all $P<.05$. Out to someone was associated with lower homonegativity (aOR 0.94, 95% CI: [0.91-0.98]) and having someone to talk about sexual health concerns (aOR 2.12, [1.22-3.83]). Out to other LGBTQ individuals was associated with lower homonegativity scores (aOR 0.96, [0.92,0.99]) and less illicit drug use (aOR 0.34, [0.17, 0.65]). Outness was not associated with HIV testing.
Conclusions: Disclosure of sexual orientation was generally associated with lower HIV risk behaviors. However, lower disclosure rates among GBM with low socioeconomic status, older age, and higher internalized homonegativity highlight the need for tailored interventions.
Future research can explore the potential causal relationships between outness and health behaviors thereby contributing to more comprehensive health promotion among GBM in India.

EP0810

"Men behave like babies:" the role of gender norms in shaping relationships between HIV care providers and men living with HIV in Uganda

K.M. Sileo[1,2], T.S. Kershaw[3], R.K. Wanyenze[4], A. Anecho[4], S.H. Vermund[5], S.C. Mukama[6,7,8], B.S. Taylor[9], J.F. Dovidio[3], S.L. Dworkin[10]

[1]Boston College, Chestnut Hill, United States, [2]University of Texas at San Antonio, San Antonio, United States, [3]Yale University, New Haven, United States, [4]Makerere University School of Public Health, Kampala, Uganda, [5]University of South Florida, Tampa, United States, [6]Infectious Diseases Institute, Kampala, Uganda, [7]Mash Research Africa, Kampala, Uganda, [8]Mildmay Uganda, Kampala, Uganda, [9]Joe R. & Teresa Lozano Long School of Medicine, UT Health San Antonio, San Antonio, United States, [10]University of Washington Bothell, Bothell, United States

Background: UNAIDS called for a better global response to engage men in HIV services in their seminal "Blind Spot" report. Much research has focused on how gender norms shape men's HIV-related behaviors, but there is less evidence of health-systems drivers of men's engagement in HIV care. Understanding how providers perceive men as clients and how their treatment of men is shaped by gender norms can inform the development of interventions to improve men's HIV care engagement.

Methods: This qualitative study was conducted in a rural and peri-urban area in central Uganda. In 2020, we conducted 7 focus groups and 15 key informant interviews involving a total of 56 people.

Focus groups included: community members (n=12); HIV care clients (n=12); HIV health and lay health workers (n=17). Key informants had expertise in HIV and the health system (e.g., district leaders).

We elicited respondents' perceptions of gender norms, clients' gendered barriers to care, and dynamics between providers and clients. We used thematic analysis to analyze our data guided by the social ecological model.

Results: Providers named gender-norm related barriers to men's HIV service use, with work conflict and HIV stigma the primary barriers, resulting in the perception that men were "bad clients" at the clinic. Women providers agreed that their status as health workers was frequently undermined by men because of societal gender roles, describing some men as unwilling to take their direction.

While they recognized that men's behavior was related to gender-related barriers, they expressed frustration towards men and stated little empathy for their challenges.

At the health systems-level, participants named existing gender-sensitive and -specific approaches to engage men. However, their implementation may be limited by pervasive "gender-blind" attitudes expressed by providers (i.e., views that men and women should be treated the same).

Conclusions: We found providers had negative perceptions of men as clients, linked to men's gendered socialization and barriers to care, which may lead to poor treatment of men and exacerbate men's disengagement. Providers need training to increase their gender-sensitive treatment of men living with HIV and to strengthen their implementation of existing gender-sensitive interventions.

EP0811

Acceptance of PEP to PrEP transitioning among adolescent sexual violence survivor's and its challenges in Taraba State, Northeast Nigeria

C. Nwodoh[1], V.C. Ugwu[2], T. Onwuka[3]

[1]University of Benin, Reproductive Health, Benin, Edo State, Nigeria, [2]Taraba State University, Nursing Sciences, Jalingo, Taraba State, Nigeria, [3]University of Benin, Benin, Edo State, Nigeria

Background: Sexual violence remains a pervasive violation of human right and dignity disproportionately affecting girls and women globally with developing Sub-Sahara Africa shouldering one of the highest burden. Experience of sexual violence leaves survivor's traumatized, and even worse when justice is not served. Post-Exposure Prophylaxis (PEP) use has drastically lowered the burden of new HIV infection following sexual violence particularly rape. Vulnerability to repeated experience of sexual violence is the bedrock for transitioning survivors from PEP to initiation on Pre-Exposure Prophylaxis(PrEP). This study aims to assess PEP-to-PrEP transitioning acceptance among participants.

Methods: Cross sectional descriptive study which used randomized sampling method from the pool of sexual violence survivors. 162 participants were recruited and administered a semi-structured questionnaire. Health care providers serving as gender or PrEP focal persons administered the questionnaire. Analysis was done using SPSS 22.0 version.

Results: The mean age of participants was 16.4±2.1 years with 128 girls and 32 boys. Majority (87%) were either in junior or secondary education. Most common reported sexual violence was rape (76%) and sexual molestation (24%). PEP use among rape survivors was at 89% and provided by trained health care workers. Survivors reported receiving minimum clinical care: psychosocial counselling (98%), HIV testing services (100%), emergency contraceptives (46%), treatment of injuries (88%), testing for other STI's (37%) and non-clinical care referral (92%). Only 53% reported completion of PEP regimen. Common reason for non-use of PEP was late presentation beyond 72hours. Survivor relationship with perpetrator revealed uncle (6%), cousin (23%), family friend (33%), peer (28%), stranger (17%), biological parent (<1%), direct-sibling (<1%), step-sibling (9%). 88% survivors received referral for pro-bono legal services while 91% received referral to other non-clinical care services.

Only 24% accepted PrEP following PEP completion however 78% PrEP acceptance was reported among survivors who received PrEP counselling at PEP completion re-testing first follow up visit. Acceptance of PrEP transitioning further grew to 89% after counselling and vulnerability assessment on the 2nd follow-up visit.

The most common reported reason for non-acceptance for transitioning was fear of daily drug intake.

Conclusions: Continuous counselling is proven in improving acceptance of PEP-to-PrEP transitioning among adolescent sexual violence survivors.

EP0812

From understanding barriers to targeted quality interventions: to Improving PEP initiation and completion rates among sexual and gender-based violence survivors in Uganda

B. Tumushabe[1], S. Sensalire[1], J. Nabwire[1], K. Baleeta[2], A. Muhwezi[3], J. Cheptoris[4], G. Kasozi[5]
[1]USAID-URC-Uganda Health Activity, Quality Assurance, Kampala, Uganda, [2]USAID-URC-Uganda Health Activity, Knowledge Management, Kampala, Uganda, [3]USAID-URC-Uganda Health Activity, Senior Management, Kampala, Uganda, [4]Ministry of Health Uganda, ACP Prevention, Kampala, Uganda, [5]USAID Uganda, Gender-GBV, Kampala, Uganda

Background: Sexual and Gender-Based Violence (SGBV) remains a critical public health issue in Sub-Saharan Africa, this presents a risk of HIV transmission and an increase in unintended pregnancies. Post-Exposure Prophylaxis (PEP) is a proven intervention to reduce HIV acquisition among SGBV survivors. However, in 2023, only 15% of survivors initiated on PEP in Uganda completed the 28-day regimen.
A Root Cause Analysis (RCA) was conducted to identify barriers to PEP initiation and completion at individual, healthcare, and community levels, informing targeted Quality Improvement (QI) interventions.
Description: A mixed-methods approach was employed, engaging 227 survivors who declined or did not complete PEP across eight regions of Uganda. In-depth interviews with community stakeholders, including local leaders, police personnel, and women's groups, highlighted their roles in timely survivor referrals.
Key barriers to PEP initiation included fear of social isolation, community judgment, misinformation about PEP, and stigma associated with perceived HIV status. Discontinuation of PEP was linked to physical side effects and inadequate adherence support.
A nationwide QI intervention was implemented in 390 high-volume sites, guided by national guidelines and RCA findings. Sites developed tailored strategies to address identified challenges, and monthly learning sessions facilitated the sharing of successes, lessons, and challenges. The intervention aimed to improve both short-term PEP outcomes and long-term integration of best practices into routine healthcare delivery.
Lessons learned: The proportion of eligible survivors initiated on PEP increased from 82% (n=806) in October 2023 to 99% (n=376) in October 2024. Completion of the full PEP regimen improved from 72% (n=576) to 95% (398) during the same period. Collaborative efforts and site-specific QI strategies were pivotal in achieving these results.
Conclusions/Next steps: A collaborative approach involving survivors, healthcare providers, and community stakeholders effectively addressed barriers to PEP initiation and completion. Tailored QI interventions demonstrated significant potential to improve HIV prevention outcomes for SGBV survivors and to embed sustainable practices into healthcare systems.

EP0813

Leveraging WhatsApp technology to enhance sexual offenses case reporting and justice delivery in Siaya county, Kenya

W. Otieno[1], H. Ngeso[2], I. Irungu[3], D. Menya[2]
[1]Catholic Medical Mission Board Inc, Monitoring Evaluation and Learning, Nairobi, Kenya, [2]Catholic Medical Mission Board, Programs, Nairobi, Kenya, [3]Kenya Redcross Society, Global Fund Program, Nairobi, Kenya

Background: In Kenya, human rights and gender-related barriers hinder access to health services. Sexual and gender-based violence (SGBV) against children and young people aged 0–24 years remains a critical issue. SGBV survivors often struggle to access justice due to systemic inefficiencies and delays. This implementation science examined the role of WhatsApp technology in bridging the gap between communities and the justice system by improving coordination among paralegals and probono advocates in Siaya County.
Description: Eleven paralegals and two probono-advocates were mapped, profiled, and trained, prioritizing paralegals under 25 years of age. After completing 21-day training curriculum covering legal frameworks and case management, they were registered with the Paralegal Society of Kenya.
A WhatsApp group established and served as a centralized communication platform, facilitating the timely reporting of new cases, updates on court dates and requirements, logistical planning for court appearances, and mentoring for young paralegals.
Advocates shared key information from court e-filing systems, enabling paralegals to update clients and prepare for court sessions. Data security was ensured through encryption and sharing only non-identifiable information. Quarterly review meetings provided opportunities to monitor progress, gather feedback, and refine approaches, fostering continuous learning
Lessons learned: Between 2023 - 2024, the WhatsApp platform significantly improved case reporting and resolution. Identified and followed-up cases increased by 150% (170 cases in 2024 compared to 68 before 2023). Reporting of sexual offences surged by 383%, and case completion rates rose from 34% in 2022 to 57.3% in 2023, reaching 74.6% in 2024.
Previously 46 stalled cases, including rape and defilement, were prioritized and resolved, reducing the backlog of SGBV cases. Nine cases filed in 2024 received judgments in an average of 2.5 months post filing which was fast enough.
Six months post-project, the practice was sustained without donor support, as paralegals continued to strengthen referral structures, ensuring long-term impact. The paralegals have embraced the practice and further incorporated resource mobilization techniques to strengthen the referral structures within Siaya county.

Conclusions/Next steps: WhatsApp technology offers a scalable, cost-effective solution for improving SGBV case management and justice delivery in resource-limited settings.
This innovation provides a replicable model for addressing SGBV challenges in similar settings.

EP0814

Sexual identity and condomless sex among Mexican MSM: the overlooked role of heterosexual-identified MSM

F. Macías-González[1], H. Vermandere[1], A. Piñeirúa-Menendez[2], S. Bautista-Arredondo[3]
[1]National Institute of Public Health of Mexico, Center for Evaluation and Surveys Research, Cuernavaca, Mexico, [2]CISIDAT, Health Research Consortium, Cuernavaca, Mexico, [3]Ministry of Health of Mexico, Economic Analysis Unit, Mexico City, Mexico

Background: Condomless sex among men who have sex with men (MSM) drives HIV transmission in Mexico. Prevention mainly targets MSM who are part of the LGBTQ-community (GB-MSM), excluding self-identified heterosexual MSM (H-MSM). Understanding risk behaviors of each group is crucial to comprehensively address the drivers of the HIV epidemic.
Methods: We identified MSM based on self-reported male partners in the 2021 Mexican National Survey on Sexual and Gender Diversity. Pearson's chi-squared tested differences between H-MSM and GB-MSM, while probit models assessed condomless sex likelihood, adjusting for socio-demographics, sexual behavior, violence, and stigma.
Results: We identified 1,083 cisgender MSM, representing 5% of Mexican men. Among them, 54% identified as heterosexual. GB-MSM and H-MSM were significantly different: GB-MSM reported less condomless sex (58% vs. 78%), and were less often married (41% vs. 68%) or living with their partner (39% vs. 64%).
A higher proportion of GB-MSM reported only male partners in the past year (77.3%); still 43.4% of H-MSM did as well. GB-MSM, versus H-MSM, were younger (31.5y vs. 39y), more educated (33.3% vs. 13.4%), reported higher socio-economic status (38.7% vs. 24.8%), and were less likely to have had a female partner during their first sexual experience (64.0% vs. 84.9%).
GB-MSM were more likely to report experiencing sexual violence (7.2% vs. 3.9%), and to perceive stigma regarding public displays of affection, same-sex marriage, and adoption (74%, 74%, and 66%, respectively, vs. 49%, 57%, and 46% among H-MSM).
In the probit model, condomless sex was significantly less likely among GB-MSM (-10.8%), those whose first sexual partner was male (-10.1%), and those with both male and female partners in the last year (-12.9%; versus female only).
However, older participants (0.4%/y), those living with partners or family/friends (26.2% and13.0%, versus living alone), those who started sex at younger age (10.7%), and those who experienced sexual violence (13.4%) were more likely to report condomless sex.
Conclusions: Mexican GB-MSM and H-MSM differ in socio-demographics and sexual health risks. While GB-MSM reported less condomless sex, they faced greater stigma and sexual violence. High rates of condomless sex among H-MSM, many with exclusively male partners, underscore the need for targeted HIV prevention.

EP0815

An exploration of the impact of sexual violence on the lives of Jamaican people of trans experience: a qualitative interpretive phenomenological study design

O. Harris[1], J. Egbunike[1], X. Biggs[2], K. Walton-Levermore[2], S. Beckford Jarrett[3]
[1]University of California, San Francisco, School of Nursing, Community Health System, San Francisco, United States, [2]Jamaica AIDS Support for Life, Kingston, Jamaica, [3]University of California, San Francisco, Department of Medicine, San Francisco, United States

Background: The prevalence of HIV is exceptionally high among transgender women (TGW) in Jamaica when compared to similar populations on the island. Childhood sexual abuse and sexual assaults in adulthood are two forms of violence that increase vulnerability to HIV. Previous studies among MSM have provided a glimpse into the pervasiveness of sexual violence in Jamaica. However, a noticeable gap in the literature is an exploration of the impact of these forms of violence on the lives of transgender individuals in the Caribbean, specifically in Jamaica.
The purpose of this study is to explore the impact of sexual violence on the lives of Jamaican people of trans experience.
Methods: In this qualitative interpretive phenomenological study, we utilized in-depth, individual, semi-structured interviews as the primary source for data collection. Data were collected between January 2018 to January 2019 from 40 adult participants located in Kingston, Jamaica. Interviews were recorded, transcribed verbatim, and analyzed using thematic content analysis.
Results: Participants age ranged between 18 to 39, with a mean of 25 years. The majority identified as transgender women (62%) and trans men (22%), with the remaining as genderqueer (15%). Participants sexual identity was mixed with the majority identifying as gay or bisexual (57%), queer or pansexual (27%), straight (10%), or other (5%).
Over half the sample reported their age of sexual debut between 2-14 years of age (55%), with 85% reporting the sexual encounter not being with someone of the same age. Participants reported forced first sexual experience (40%), with the perpetrator being male (83%).
Common themes emerged that highlight the patterns and nature of the abuse, the characteristics of the perpetrators, and the ways in which participants engage agency and resiliency as a basis to reclaim personal power.
Conclusions: These findings serve as a catalyst for understanding how experiences with CSA and sexual assault affect the lives of Jamaican transgender individuals. The findings also help us understand how those experiences

with sexual violence may impact attitudes and behaviors regarding accessing HIV treatment and prevention. Our findings also have implications for shaping legal, policy, clinical, and mental health services for Jamaican transgender survivors of sexual violence.

EP0816

Strengthening gender-responsive approaches to HIV prevention among adolescent girls and young women in Kenya: a community-centered model

R. Makenywa[1], G.M. Karoki[2], P.C. Kiarie[3]
[1]Ambassadors Of Change NGO, Human rights and Programs, Nakuru, Kenya, [2]KPC, Training /Engeenering, Nakuru, Kenya, [3]Bliss Women and Children Org, ICT/ training, Nakuru, Kenya

Background: Adolescent girls and young women (AGYW) account for a significant proportion of new HIV infections in sub-Saharan Africa, including Kenya. Gender inequalities, poverty, limited access to sexual health education, and social norms exacerbate their vulnerability. Despite targeted interventions, the uptake of HIV prevention services among AGYW remains low, particularly in rural areas.
This study evaluates a gender-responsive, community-centered approach to addressing these challenges.
Description: A participatory action research model was employed across three rural counties in Kenya, engaging 600 AGYW aged 15–24 years. Key interventions included comprehensive sexuality education sessions delivered by trained female mentors, the provision of pre-exposure prophylaxis (PrEP), and economic empowerment programs such as vocational training.
Additionally, parents and community leaders were engaged through dialogue sessions to address harmful gender norms. Data were collected through surveys and interviews over a 12-month period.
Lessons learned: The intervention led to a 30% increase in PrEP uptake and a 25% reduction in self-reported risky sexual behaviors among participants. Over 70% of AGYW reported improved knowledge of HIV prevention strategies. Community dialogues resulted in a 40% increase in parental support for AGYW accessing prevention services. Economic empowerment initiatives were associated with higher self-esteem and reduced dependency on transactional relationships, a key driver of HIV risk.
Conclusions/Next steps: Gender-responsive, community-centered interventions can effectively reduce HIV vulnerability among AGYW in rural Kenya.
Holistic approaches that combine education, health services, and economic empowerment, while addressing harmful social norms, are critical to achieving sustainable impact. Scaling up such interventions and integrating them into national HIV prevention programs should be prioritized.

Implementation research to scale up HIV testing

EP0817

A game changer: acceptability of long-acting injectable PrEP (cabotegravir) among female sex workers and men who have sex with men in Nakonde District, Zambia

L. Chingumbe[1], K. Key Population Alliance of Zambia[2]
[1]Center for Public Health Promotion, Technical, Lusaka, Zambia, [2]Controlling HIV Epidemic for Key and Underserved Population Activity II, Technical, Lusaka, Zambia

Background: In February 2024, Zambia became the first country in sub-Saharan Africa to introduce long-acting injectable PrEP (CAB-LA) outside of a study setting. This rollout, implemented in Nakonde District targeting female sex workers and men who have sex with men, populations at substantial risk of HIV. CAB-LA offers a convenient alternative to oral PrEP, addressing adherence challenges and stigma, while enhancing HIV prevention outcomes.
This study evaluated the acceptability and early outcomes of CAB-LA in this high-risk border district.
Methods: A mixed-methods study was conducted from February to September 2024, engaging 250 individuals (150 FSWs and 100 MSMs) enrolled in the CAB-LA program. Quantitative data on uptake, retention, and satisfaction were extracted from program records, while qualitative data were gathered via focus group discussions and interviews. The study explored factors influencing willingness to initiate CAB-LA, barriers, retention over the first six months.
Results: Among those approached, 85% of FSWs (128/150) and 78% of MSMs (78/100) initiated CAB-LA. High acceptability was driven by:

- Convenience: 94% (121 FSWs) and 89% (69 MSMs) preferred bi-monthly injections over daily pills.
- Discretion: 87% (111 FSWs) and 82% (64 MSMs) valued CAB-LA's reduced stigma compared to oral PrEP.
- Perceived Efficacy: 90% (115 FSWs) and 85% (66 MSMs) expressed confidence in CAB-LA's effectiveness.

Retention was high, with 91% of FSWs and 88% of MSMs returning for their second dose. Side effects were minimal, with 10% (13 FSWs) and 12% (9 MSMs) reporting mild injection-site reactions. Barriers to uptake included fear of needles (27% FSWs, 25% MSMs) and limited initial knowledge about CAB-LA (33% FSWs, 30% MSMs).
The rollout was supported by peer educators, key population civil society organizations, and micro-planning approaches.
These strategies enhanced education, addressed misconceptions, strengthened community engagement, leading to increased demand for CAB-LA.
Conclusions: The introduction of CAB-LA under the USAID CHEKUP II Activity was a game changer for HIV prevention among FSWs and MSMs in Nakonde, with strong uptake and retention.
This experience demonstrates the potential for scaling long-acting PrEP to diverse key populations in sub-Saha-

ran Africa. Sustained education, peer involvement, and targeted outreach remain critical to overcoming barriers and maximizing the impact of CAB-LA.

EP0818

"Self-testing is good, but you can lose your life if your heart is not strong": community perspectives on HIV self-testing for adolescent girls and young women in northern Uganda

R. Olum[1], M. Okello[1,2], D. Otika[2], F. Kitutu[3,4], E. Geng[5], P. Musoke[6,7]

[1]Makerere University, School of Public Health, Kampala, Uganda, [2]Gulu University, Faculty of Medicine, Gulu, Uganda, [3]Makerere University, Kampala, Uganda, [4]Uppsala University, Department of Women's and Children's Health, International Child Health and Migration, Uppsala, Sweden, [5]Washington University in St Louis, St Louis, United States, [6]Makerere University, Department of Paediatrics and Child Health, Kampala, Uganda, [7]MU-JHU Care Ltd, Kampala, Uganda

Background: Despite progress toward the UNAIDS 95-95-95 targets, HIV testing among adolescent girls and young women (AGYW) remains low, with only 56% reporting testing in the past 12 months, according to the most recent Uganda demographic health survey. While HIV self-testing (HIVST) has the potential to address key barriers, little is known about factors influencing its uptake among AGYW in Northern Uganda.

This study explored community perspectives on HIVST to inform a peer-led, community health worker (CHW)-facilitated HIVST model for AGYW in rural Northern Uganda.

Methods: This qualitative study was conducted from September to October 2024 among community stakeholders in five sub-counties in Omoro District, Northern Uganda. We purposively recruited 48 AGYW and 33 CHWs for 10 focus group discussions (FGDs), each with 5–10 participants, facilitated by two trained research assistants in Acholi and Lango languages. We also conducted in-depth interviews with 13 local council leaders. All recordings were translated and transcribed verbatim for inductive thematic analysis in *Atlas.ti.*

Results: Six themes emerged from the FGDs with AGYW: perceived benefits of HIVST, concerns about HIVST, sociocultural influences, barriers, facilitators, and suggestions for improvement. AGYW valued the convenience and confidentiality of HIVST but were concerned about accuracy, emotional distress that may be triggered, and potential judgment on promiscuity or infidelity from parents and spouses. They suggested training, improved access, additional support resources, follow-up options, and community education. CHWs recommended affordable kits, peer involvement, and integration with existing health services, while local council leaders emphasized community mobilization, culturally tailored education, and utilization of trusted networks (such as churches and schools) to promote testing and address post-test challenges.

Conclusions: HIVST has the potential to increase community-level coverage of HIV testing due to its convenience and confidentiality, but concerns about access, accuracy, capability, emotional impact, and societal judgment could hinder its uptake among AGYW in Northern Uganda. Strengthening community engagement, providing robust support systems, and offering culturally tailored education and follow-up are crucial for successful implementation.

Further research is needed to refine community-led HIVST implementation strategies in resource-limited settings, focusing on its sustainability and potential for future scale-up.

Implementation research to scale up HIV testing

EP0819

Connecting priority populations to HIV testing services through online solutions in Ukraine

I. Kovalchuk[1], M. Zinck[2], O. Protsenko[3], K. Tulin[4], A. Dyachkovska[5], D. Shevchuk[1]

[1]FHI 360 Ukraine, Kyiv, Ukraine, [2]FHI 360, Durham, United States, [3]FHI 360 Ukraine, Zaporizhzhia, Ukraine, [4]100 Percent Life, Kyiv Region, Kyiv, Ukraine, [5]Alternative, Odesa, Ukraine

Background: The ongoing Russian–Ukraine war has severely reduced access for priority populations (PPs) in HIV prevention and treatment programs due to the destruction of health care facilities, displacement of medical personnel and citizens, and reduced demand by PPs. Digital approaches including online marketing and reservation platforms may be viable in areas with limited ability for physical outreach and services.

Description: Funded by USAID/PEPFAR and implemented by Pact, FHI 360, AIDS Foundation East West, and local nongovernmental organizations, the Community Action for HIV Control project piloted GoPoruch, Ukraine's first online service booking platform for HIV testing and prevention, in August–September 2024. GoPoruch provides automated appointment reminders and follow-up messages for missed appointments via SMS.

The project launched a digital marketing campaign to promote GoPoruch across social media and Google among groups vulnerable to HIV acquisition.

Lessons learned: The marketing campaign generated 4 million impressions and over 51,000 ad clicks, with an average cost-per-click of US$0.09 in the initial one-month pilot. Parallel advertising campaigns tailored to different audiences vulnerable to HIV resulted in a click-through rate of 3% and 436 booked services, including HIV and sexually transmitted diseases testing and counseling.

The pilot achieved a 63% appointment arrival rate, with a yield of 2.5% HIV-positive cases. This case finding exceeded the national yield of 0.5% in 2024 and is aligned with PP-specific case-finding rates of 2.7% in 2023. GoPoruch bookings resulted in 84% new clients (i.e., not previously engaged in HIV prevention services), compared to 73% new clients engaged through differentiated service delivery (DSD) models during the same period. GoPoruch ap-

pointments outperformed DSD models in reaching new clients in each of the three project regions: Odesa (100% vs. 93%), Lviv (76% vs. 60%), and Kyiv (75% vs. 65%).

Conclusions/Next steps: The GoPoruch pilot demonstrated that online marketing campaigns and service bookings can complement DSD models by engaging new clients from populations most vulnerable to HIV acquisition. GoPoruch and other digital tools may be important approaches to close service gaps when physical outreach is challenging and should be investigated further.

EP0820

Transforming retesting into Re-engagement: a success strategy in the Alto-Mae Health Facility, Maputo – Mozambique, 2024

K. Selma[1], B. Aly[1], R. Pedro[1], M. Pereira[2], G. Amane[3], A. Buque[1], M. Timecane[1], R. Mendes[1], I. Gaspar[3], V. Zitha[2], L. Daniel[1]
[1]Center for Collaboration in Health, Maputo, Mozambique, [2]Maputo City Health Services, Maputo, Mozambique, [3]MOH, Maputo, Mozambique

Background: HIV retesting provides an opportunity to re-engage people who are aware of their HIV status but who discontinued or never initiated antiretroviral treatment (ART). In Maputo City, the proportion of people retested substantially increased after the centralization of health facility electronic patient tracking system (EPTS) in 2024. Retesting facilitated the identification of people who previously took ART at any healthcare facility in Maputo.

To ensure a non-judgmental environment and facilitate re-engagement of people retested, the Center for Collaboration in Health, in coordination with health authorities, piloted an approach that used follow-up flowcharts and welcoming messages.

Description: The pilot was implemented between July and September 2024 in the Alto-Maé Health Facility. All clients with an HIV-positive test result were cross-checked in the EPTS database. Any person identified as retested, received welcoming and supportive messages. Clients who wished to continue treatment were asked to select their health facility of choice.

For those choosing to continue care at the Alto-Maé Health Facility, a notification was sent to their previous follow-up site to update their retention status and their medical chart was printed from the system. A notification was also sent to clinics for clients that selected to receive care at a different facility.

Lessons learned: Of 199 people testing positive for HIV, 22% were retested (n=43/199). Among the 43 people retested, 53% tested in outpatient consultations, 100% adults, and 65% were female.

The majority, 84% (n=36/43), were lost to follow-up (LTFU) and 16% (n=7/43) were active in treatment. Among those LTFU, 86% (n=31/36) were successfully re-engaged in care and treatment.

The centralized database, along with the structured flowchart and welcoming messaging, facilitated re-engagement and provided clear guidelines for healthcare providers on follow-up procedures for clients retested.

Conclusions/Next steps: The implementation of the approach was an effective strategy to re-engage people LTFU into care in Maputo. Based on this experience, it may be worth considering expanding implementation of this strategy to other health facilities.

EP0821

Enhancing access to HIV testing services and HIV case finding among key populations in Myanmar through innovative testing modalities

L. Htet[1], L.A. Thu[1], T.Y. Pyone[1], P.P. Phyo[1], M.K. Kyaw[1], T.T. Win[1], H.Y.Y. San[1], K.P. Naing[1], Z.M. Oo[1], K.K. Lay[1]
[1]Community Partners International, HIV/TB Agency, Information and Services Activity, Yangon, Myanmar

Background: HIV testing coverage among key populations in Myanmar is suboptimal, with 31% among MSM&TGW, 41% among FSW, and 28% among PWID. Despite the challenges posed by the military coup and escalating conflicts, the HIV/TB Agency, Information, and Services (AIS) Activity, with the support of USAID/PEPFAR, remains steadfast in its commitment to prioritize HIV Testing Services (HTS) among key populations in five states and regions of Myanmar. AIS and its implementing partners have been instrumental in providing HTS using various innovative modalities, including facility-based, community-based, Provider Initiated Testing and Counseling (PITC), index, and social network testing, to bridge the gap of HTS among key populations.

Description: Facility-based HTS is conducted at Key Population Service Centers (KPSCs), focusing on key populations referred by Peer Educators through online and physical outreach. Community-based HTS is carried out at hotspots and hard-to-reach areas in the field by mobile HTS teams and peer educators trained for Community-Based HIV Screening (CBS). Provider-initiated testing and counseling (PITC) is facilitated at KP-friendly clinics of Private General Practitioners.

Index testing, which uses assisted and voluntary partner notification, and Social Network Testing, which involves recruiting Peer Mobilizers among service users to refer clients from their social networks, are also part of the innovative modalities used.

Lessons learned: From October 2022 to September 2024, AIS and its partners provided HIV testing services using various modalities. Facility-based testing screened 55,611 clients, identifying 4,711 positive cases, resulting in an 8% positivity rate. Community-based testing reached 35,044 individuals, with 1,997 positive cases identified and a 6% positivity rate. PITC, with GPs, tested 5,627 clients, finding 218 positive cases with a 4% positivity rate. Index testing identified 1,557 HIV-positive cases among 5,167 individuals, reflecting a 30% positivity rate. Social network testing resulted in 208 HIV-positive cases among 3,123 individuals, with a 7% positivity rate.

Conclusions/Next steps: Innovative testing modalities have significantly improved access to HTS and HIV case findings among key populations during the current conflict in high-burden HIV areas. AIS will continue to undertake qualitative and quantitative reviews of these modal-

of MiHIV design. Compared to the 24.9% who preferred the PHC model (pick up at a PHC, with support in Japanese, free of charge) that was trialed with Japanese people in 2023, 57.1% preferred the home model (mailed to home, with support in the tester's native language, free of charge), and 18% preferred neither. The estimated marginal willingness-to-pay for the home model was US$6.5.
Conclusions: This study is the first of its kind in Japan to use DCE to elicit the preferences among international migrants regarding MiHIV. The findings should be incorporated into the design of a multilingual MiHIV program in the future.

EP0827

Innovative approaches to community-based HIV testing services among pregnant women using community TB/HIV workers and mentor mothers: an experience from Oyo state, Southwest, Nigeria

M. Isa[1], F. Muse[1], J. Babalola[2], A. Akinyole[3], L. Abass[4]
[1]Damien Foundation Belgium (Nigeria Project), Programme, Ibadan, Nigeria, [2]State Tuberculosis, Leprosy, and Buruli Ulcer Control Programme, Ibadan, Nigeria, [3]State AIDS, Viral Hepatitis and STIs Control Programme, Ibadan, Nigeria, [4]State Agency for the Control of AIDS, Programme, Ibadan, Nigeria

Background: Early diagnosis and treatment of HIV in pregnant women are critical for preventing mother-to-child transmission (PMTCT) and achieving better health outcomes. However, in many high-burden, resource-limited settings, gaps in service delivery and access remain a challenge.
To address these barriers, an innovative community-based HIV testing model leveraging Community TB/HIV Workers (CTHWs) and Mentor Mothers was implemented in Southwest Nigeria
Description: Between January 2024 and December 2024, this intervention was introduced in under-served wards and communities in Oyo state. Community Volunteers and CTHWs conducted routine household visits and integrated TB/HIV education, and testing services for pregnant women. Mentor Mothers provided peer counselling, psychosocial support, and linkage to care for newly diagnosed women. Health education sessions were conducted at antenatal care centres and community events to improve awareness and reduce stigma. Data was collected and analysed using Microsoft Excel.
Lessons learned: The intervention identified and screened 30,000 pregnant women using the appropriate eligibility criteria. 96% accepted HIV testing. Among them, 72 pregnant women were identified as living with HIV and were successfully linked to antiretroviral therapy (ART). EID samples were collected and tested for the infants.
Retention in PMTCT programs at six months improved from 62% to 85%, supported by Mentor Mothers' peer counselling and follow-ups.
Community engagement activities led to a 30% increase in antenatal care attendance, with the barriers related to stigma significantly reduced, improving access and acceptance of services.
Conclusions/Next steps: The integration of CTHWs and Mentor Mothers into community-based HIV testing services has proven effective in increasing uptake, reducing stigma, and improving PMTCT program retention among pregnant women. This model demonstrates the importance of community-driven, person-centred approaches in addressing access and service delivery challenges. It offers a scalable solution for high-burden regions aiming to reduce mother-to-child transmission and improve maternal and child health outcomes.

EP0828

"Casting a safety net in unfamiliar waters"; expanding HIV testing and counselling among pregnant women in unconventional settings in the community. The Akwa Ibom State experience

S. Nkanu[1], B. Odume[2], M. Sheshi[3], F. Okoh[3], O. Adebayo[4], T. Adetiba[4], O. Olupitan[4], U. Ugwoke[4], K. Tsujii[5], M. Zamzu[5], E. Asuquo[1], F. Uzokwu[1], N. Daniel[1]
[1]KNCV Nigeria, Global Fund Community Public Private Mix (CPPM) Project, Uyo, Nigeria, [2]KNCV Nigeria, Abuja, Nigeria, [3]KNCV Nigeria, Global Fund Community Public Private Mix (CPPM) Project, Abuja, Nigeria, [4]Institute of Human Virology, Nigeria (IHVN), Global Fund N-THRIP, Abuja, Nigeria, [5]Global Health Campus, The Global Fund to Fight AIDS, Tuberculosis and Malaria, Geneva, Switzerland

Background: Pregnant women (PW) are vulnerable to acquiring Human Immunodeficiency Virus (HIV). Nigeria has one of the highest burdens of HIV globally, and PW living with HIV likely accounts for a significant proportion of women living with HIV, considering the country's high fertility rate and growing population. HIV testing of PW in unconventional settings such as traditional birth attendants (TBAs) homes and congregational settings can be an effective way to increase access to HIV testing. However, this component of community prevention of vertical transmission of HIV has often been underutilized.
We aim to evaluate the effectiveness of expanding HIV testing and counselling among PW receiving care in unconventional settings in the community.
Description: KNCV Nigeria through the Institute of Human Virology, Nigeria (IHVN) has commenced implementing the Community Public Private Mix (C-PPM) project across all 31 Local Government Areas in Akwa Ibom State. The project spans from January 2024 to December 2026, prioritizing pregnant women receiving antenatal care across all unconventional settings utilizing the house-to-house (H2H) approach and targeted screening in TBA homes. Indigenous community volunteers, mentor mothers, and community testing workers were engaged, trained, and mobilized into teams to provide comprehensive HIV testing and counselling services in the community.
Lessons learned: Between March 2024 to November 2024, a total of 11847 PW (10716 from H2H, 1131 from TBA homes) were reached in the community and screened using the HIV screening checklist. 9343 PW (8791 from H2H, 552 from TBA homes) were eligible and tested for HIV. 38 PW (33 from H2H, 5 from TBA homes) tested positive for HIV and were referred to hub facilities for treatment,

yielding a positivity rate of 0.4%. H2H contributed the highest number of PW reached and positives detected, at 90% and 87%, compared to 10% and 13% in TBA homes respectively.

Conclusions/Next steps: Expanding HIV testing and counselling services to unconventional settings through an H2H approach has proven to be effective in reaching PW who might otherwise be neglected. This intervention demonstrates the importance of community-based strategies in increasing access to HIV testing. Therefore, scaling up H2H approach can significantly contribute to reducing the vertical transmission of HIV.

EP0829

HIV index case testing and partner notification by way of self-testing: sealing the gap to epidemic control in Zambia

K. Mwanda[1], S. Malubale[2]
[1]Diligent Health Initiatives, Technical, Lusaka, Zambia, [2]University of Zambia, Education, Lusaka, Zambia

Background: Robust approaches to help attain the 95-95-95 UNAIDS targets and HIV epidemic control have increasingly become far-fetched. Through a randomized-clinical trial, we investigated the extent to which index case testing and partner notification by way of oral HIV self-testing compared to the traditional/conventional methods of provider and client referral in enabling HIV testing among undisclosed sexual partners in Zambia.

Methods: A cluster-randomized-clinical trial was conducted. The intervention arm respondents were given two oral HIV self-testing (ST) kits to use with their undisclosed-status-sexual partner. Control group of respondents were either allocated to provider referral (PR) or client referral (CR). All respondents were availed counselling around benefits of having their partners tested. 532 (223 males and 309 females) with 177 (79 males and 98 females) were randomized to the intervention arm while 355 to the control: 173 (65 males and 107 females) in PR, and 182 (78 males and 104 females) in CR.

Results: Of the 177 respondents in the intervention arm, 77.4%(137) facilitated for their partners to be tested compared to 71.5%(254) in the control arm. In the intervention arm, 44.6% (79) facilitated for their partners to be tested at Day Zero compared to 32.1% (114) in the control arm. Participants in the intervention arm were 1.23 times more likely to facilitate for their partner to be tested by Day Three compared to PR (OR=1.23; P=0.012, 95% CI) and 1.225 times more likely compared to CR (OR=1.225; P=0.015 at 95% CI). Day Seven, 80.5%(143) in the intervention arm facilitated for their partners to be tested compared to 74.4%(264) in the control arm. At Day14 - 67.2%(119) in the intervention arm compared to 56.9%(202) in the control arm. The intervention arm also recorded the lowest maximum period taken to have partner tested (27 days) compared to 130 days in the control arm. There was no record of intimate partner violence.

Conclusions: Index case testing and partner notification by way of self-testing is safe and non-inferior to that by way of the traditional/conventional provider and client referral approaches. It holds potential for a significant role in enabling efficient identification of undiagnosed partners in sexual relationships.

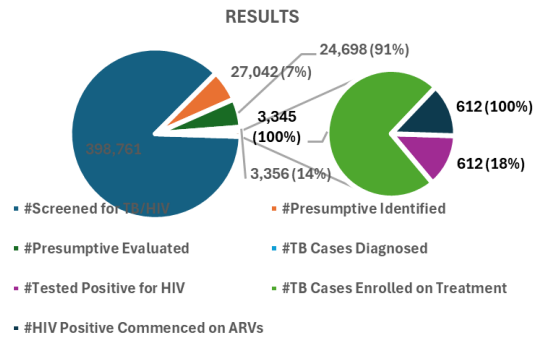
EP0830

Improving TB/HIV case detection in public health facilities through collaborative efforts - using two-way-referral system: The Kano State Experience

G. Zephaniah[1], M. Bajehson[2], T. Mustapha[2], Z. Ganiyat[1], N. Bakir[1], A. Zarewa[3], D. Abdulrazaq[2], C. Ogbedube[4], C. Ogoamaka[5], B. Odume[6]
[1]KNCV Nigeria, Strategic Information (SI), Kano, Nigeria, [2]KNCV Nigeria, Technical, Kano, Nigeria, [3]Kano State Ministry of Health, Public Health, Kano, Nigeria, [4]KNCV Nigeria, Strategic Information (SI), Abuja, Nigeria, [5]KNCV Nigeria, Management/Technical, Abuja, Nigeria, [6]KNCV Nigeria, Chief Executive, Abuja, Nigeria

Background: KNCV Nigeria through the USAID TB LON Region 1&2 Project is conducting facility-based TB screening in public health facilities in Kano state. The co-location of USAID TB and HIV implementation partners in 9 selected public health facilities that has both ART and DOTS units, avails the opportunity to screen for TB and HIV in the two service delivery units to improve TB/HIV case detection in the state.

Methods: TB screeners and HIV case managers deployed in the 9 co-located facilities were trained through competency-based training modules to equip them with the pre-requisite knowledge of both TB/HIV screening. TB screeners will screen all participants for TB/HIV signs and symptoms and Identified presumptive for TB and diagnosed TB cases are tested for HIV at the spot and diagnosed HIV positive cases - escorted to ART site to be documented and initiated on ARVs – while on the other hand HIV facility case managers conduct TB screening alongside HIV testing/counselling at the ART unit and identified presumptive TB escorted to DOTS units for documentation and collection of sputum sample for TB evaluation.



Results: Within a period of 12 months (October 2023 – September 2024) the following were achieve:

- A total of 398,761 facility attendees were screened for both TB and HIV at both DOTS/ART units;
- 27,042 (7%) presumptive TB were identified,
- 24,698 (91%) were evaluated for TB and tested for HIV,
- 3,356 (14%) TB cases were diagnosed,

- and 612 (18%) tested positive for HIV,
- 3,345 (100%) TB cases were enrolled on TB treatment, and;
- 612 (100%) HIV Positive patients commenced on ARVs.

Conclusions: The study results demonstrated that establishing a good working relationship between TB and HIV program partners within a given health facility can greatly improve TB/HIV case findings and thus help in addressing the dual burden of TB and HIV in the country.

EP0831

Barriers and facilitators to HIV self-testing: an evaluation of HIV self-testing innovation in Centenary District, 2023

T.R. Musekiwa[1], O. Mugurungi[2], M. Mungati[3], T. Juru[4], A. Chadambuka[4], G. Shambira[1], N. Gombe[5], M. Tshimanga[1]

[1]University of Zimbabwe, Global Public Health and Family Medicine, Harare, Zimbabwe, [2]Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, [3]EGPAF, Maseru, Lesotho, [4]Zimbabwe Field Epidemiology Training Program, Harare, Zimbabwe, [5]Africa Field Epidemiology Network, Harare, Zimbabwe

Background: Testing remains a key entry point to HIV prevention. Inequalities still exist in HIV testing and prevention services particularly among men, adolescents and key populations. HIV self-testing (HIVST) is an innovation introduced to facilitate closure of status awareness gaps among these groups.

We investigated reasons for low uptake of HIVST and HIV testing preferences in Centenary district of Zimbabwe which reported an HIVST coverage of 5% against target.

Methods: A cross-sectional study coupled with the process-outcome evaluation of program evaluation was conducted. Forty healthcare workers (HCWs), 250 clients, were interviewed, in addition of HIVST registers and monthly return forms reviews utilizing questionnaires, interview guide and checklists respectively to assess knowledge, availability of inputs, reasons for low uptake and HIV testing choices.

Overall knowledge was measured using a 3-point Likert scale. Factors associated with choice of HIV testing method were determined using backward logistic regression for covariate (p value<0.25).

Results: Eleven health facilities, 40 HCWs and 250 health service clients were included in the study. Majority 148/250 (59.2%) of clients were females while the most common age group was the 25-39 years with 97/250 (38.8%) participants and the adolescent group comprised 33/250 (13.2%) participants.

Adolescents had the least proportion 3/23 (13%) of those who had heard about HIVST, and where 70% (OR:0.3 95%CI; 0.1-0.7) less likely to use HIVST over conventional HIV testing (CHIVT). Males were 3(aOR:3.0 95%CI; 1.6-5.5) times likely to choose HIVST over CHIVT.

Those who preferred oral fluid-based (ORF) HIVST over blood-based (BB) HIVST and those who knew where to get HIVST kits were 4 (aOR:3.7 95%CI; 2.0-6.7) and 5(aOR:4.8 95%CI; 1.8-19.4) times likely to utilize HIVST over CHIVT respectively. Thirty-one (78%) HCWs preferred offering CHIVT to HIVST. Overall, 187/250 (75%) clients had poor HIVST knowledge. No health facility 0/11 had IEC material on HIVST, community HIVST distribution and had distributed kits to key populations.

Conclusions: Clients' preferences possibly affected by their knowledge, influenced uptake of HIVST. Limited health promotion, under-utilization of community distributors and health worker barrier contributed to low HIVST uptake. Tailored educational programs especially for adolescents and peer distributors can improve uptake of HIVST.

EP0832

Impact of men's clinics on HIV testing and linkage to treatment in men aged 15 yrs and above from 2019-2023: a case study of men's clinics in Lusaka District

J. Zulu[1], M. Munamwimbu[1], K. Zyambo[2], F. Mwape[3], E. Musukuma[3], Z. Sikazwe[1], C. Bolton[1], T. Savory[1], K. Moomba[1], M. Wa Mwanza[1], O. Kachika[3], N. Vlahakis[1]

[1]Centre for Infectious Disease Research in Zambia - CIDRZ, Lusaka, Zambia, [2]Ministry of Health, Lusaka, Zambia, [3]Lusaka Provincial Health Office, Lusaka, Zambia

Background: In Zambia, men's health outcomes are worse than women's due to poor health-seeking behavior. This gender disparity has been overlooked by policymakers and healthcare providers. The Zambia Population-Based HIV Impact Assessment (ZAMPHIA 2021) revealed significant age and gender gaps in HIV testing, knowledge, and treatment linkage. Men's clinics have been established as a differentiated service delivery model to increase men's engagement with HIV services.

Methods: The Centre for Infectious Disease Research in Zambia (CIDRZ) implemented male-friendly services in 13 facilities in Lusaka district, Zambia. These services were provided by dedicated male providers in most cases either by dedicating a specific male consultation room or independent clinic with its own consultation, registry, dispensary, counseling, and male circumcision room with support from CDC, WHO and a Global Fund catalytic fund. We measured HIV testing uptake and linkage to treatment in these sites from Jan 2019 to Dec 2023.

Results: We found a significant increase in HIV testing services for men aged 15 years and above, with 1,143 men tested between January and March 2019, steadily rising over time to 31,826 men tested between October and December 2023. During the same period, 178 positive cases were identified in early 2019, all of whom (100%) were successfully linked to treatment, while in the latter period, 1,891 positives were identified, with 1,818 (96%) linked to treatment.

Conclusions: Men's clinics in Lusaka district have increased access to HIV Testing and care,and improved linkage to treatment among men. These Clinics offer special focus on sexual reproductive health and HIV Testing. Future research is required to assess impact of Men's Clinics on health seeking behaviours of men.

EP0833

Enhanced index testing process improves HIV case identification among index contacts: case study for Mponela Rural Hospital, Dowa, Malawi

P. Nyasulu[1], L. Maruwo[2], J. Gama[1], L. Banda[1], A. Mganga[1], A. Abubakar[1], G. Msachiwa[3], P. Ndovi[3], G. Kakwesa[2], J. van Oosterhout[2], A. Worku[1]
[1]USAID Malawi, Lilongwe, Malawi, [2]Partners in Hope, Lilongwe, Malawi, [3]Partners in Hope, Mponela, Malawi

Background: The 2024 Naomi Estimates for Dowa District indicate 1,196 PLHIV remain undiagnosed. Index testing is among the effective strategies for HIV case finding. Despite this, a decline in quarterly index testing coverage from 82% to 69% in FY2022 was noted at Mponela Rural Hospital in Dowa District. Continuous quality improvement (CQI) project was launched with the goal of increasing index testing coverage from 69% to 95% between January 2023 and March 2024.
Description: The facility analyzed index testing coverage data (percentage of index contacts tested [HTS_INDEX] against contacts elicited) for all ages between October 2021 and December 2022 (pre-CQI) and used fishbone diagram to analyze the root causes. The findings guided implementation of prioritized countermeasures and changes through Plan-Do-Study-Act cycles.
Cycle 1 interventions included contact elicitation during pre-test counseling session, weekly data review meetings and mentorship.
Cycle 2 focused on improved address identification, optimized use of transport means for contact tracing, accelerated testing of contacts within 3 days of elicitation in the community.
Data was extracted from DATIM to monitor performance trends for pre-CQI baseline period, throughout the 5 quarters of implementation and 2 quarters post-implementation.
Lessons learned: Overall testing of index contacts increased from 500 (pre-CQI) to 624 (CQI period). The quarterly index testing coverage increased from pre-CQI baseline of 69% (Oct – Dec 2022) to 99% (Jan – Mar 2024) during CQI period. The trend was similar between male and female index contacts and sustained at 95% for 2 quarters post-CQI. The overall number of HIV positives identified increased from 139 (28% positivity in pre-CQI) to 158 (25% in CQI period) with higher mean positivity among males (29%) compared to females (22%).

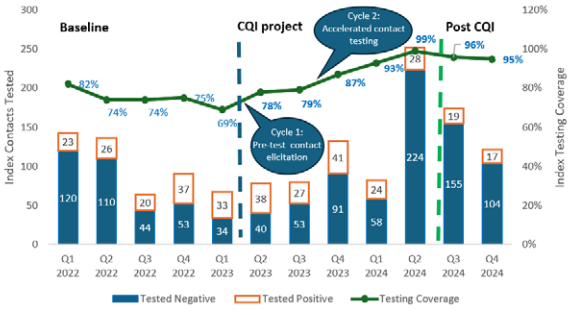


Figure. CQI project increases index testing coverage at Mponela RH.

Conclusions/Next steps: The enhanced index testing process improved efficiency of HIV case finding especially for males. Intensified efforts are encouraged to reach undiagnosed PLHIV especially men as means to attain epidemic control.

EP0834

Tracking, engaging & linking with care of blood donors tested HIV+ after routine blood screening – a first of its kind demonstration project in Pakistan by APLHIV

M.O. Haider[1], S.T. Muntaha[1], A. Satti[1]
[1]Association of People Living with HIV-Pakistan, Islamabad, Pakistan

Background: With 300,000 people living with HIV only 23% know their HIV status in Pakistan as per UNAIDS. There is dire need to scale up HIV testing and ART linkages via innovative approaches to ensure 95-95-95 target achievement. With 170 public and 450+ private blood banks across Pakistan, there is no mechanism to link persons tested HIV+ with HIV treatment. These PLHIV may be unknowingly contributing to the increasing prevalence of HIV in Pakistan.
A project to identify HIV+ persons screened via blood bank located at the largest tertiary care hospital in the capital Islamabad was carried out with the aim to identify and link the persons tested HIV+ with ART.
Description: Once data was received via blood bank the blood donors were approached telephonically by APLHIV based Psychologist with vast experience of working with PLHIV & KPs. Without revealing their HIV results the Psychologist encouraged them to visit the nearest ART facility for re-testing. Generic reasons were put forward to encourage these persons to take confirmatory test at ART Center. Re-Confirmed HIV+ cases were initiated on ART and regular counseling was provided via Psychologist to ensure that newly diagnosed PLHIV come to term with their HIV status. Linkages were also made with community/peer support groups of APLHIV to provide ongoing peer support to ensure adherence. The newly confirmed PLHIV were encouraged to get spouses/partners tested and Psychosocial services were also provided to these family members.
Lessons learned: A dataset of 198 HIV+ blood donors was shared with APLHIV. Contact was made with 177 persons and all were re-tested and started ARVs. 147 Spouses & children were also tested and 01 spouse and 01 Child were confirmed HIV+ and brought on ARVs. Thus in a short span of 6 months 179 new people were brought on ART.
Conclusions/Next steps: Blood banks can provide vital support to scale up HIV testing in a resource limited setting like Pakistan. It is recommended that linkages be made with blood banks across the country as a model of differentiated HIV testing in order to successfully achieve the first of 95-95-95 targets and close gaps in HIV treatment coverage and outcomes.

among high-risk populations was high and promising improvement in PrEP efficacy. Only a few switched back to daily oral PrEP, highlighting opportunities to learn about ongoing preferences and usage.

EP0847

PrEP uptake and STI services for male sex workers (MSWs) in Mangochi District, Malawi: a lesson in service integration

K. Chapola[1], A. Mitha[1], R. Muko[2]
[1]Community Health Rights Advocacy (CHeRA), Lilongwe, Malawi, [2]Key Population Transnational Collaborations (KP-TNC), Nairobi, Kenya

Background: As Malawi strives for sustainability in its health and HIV services, integration has become a critical focus of developing a sustainability roadmap. A key example of this effort is a project in Mangochi District that integrates Pre-Exposure Prophylaxis (PrEP) and sexually transmitted infection (STI) services for Male Sex Workers (MSWs) within the Lesbian, Gay, Bisexual, Transgender, Queer and Intersex, Asexual (LGBTQI+A) community at a Drop-In Centers (DICs) frequently accessed by key populations. The project aims to prevent HIV while identifying and treating STIs promptly to curb their spread within the MSWs community in Mangochi District, Malawi.
Description: The project was incepted in October 2023 in Mangochi District and integrates PrEP and STI services at a DIC, frequently used by LGBTQI+A and MSWs. The program uses LGBTQI+A and MSWs peer educators to provide tailored health education, facilitate service navigation, and ensure adherence to both PrEP and STI treatment in collaboration with the community healthcare workers. Data were collected on an ongoing basis from program reports and focus group discussions with healthcare providers and clients to evaluate the effectiveness of the service integration in improving HIV prevention and STI treatment outcomes.
Lessons learned: The project data revealed a 50% steady decline in HIV incidence and a 60% average reduction in STI incidence over the two years. Focus group discussions confirmed that STI testing and treatment were pivotal for the effectiveness of PrEP. Both healthcare providers and clients affirmed that integrating services improved accessibility and uptake, significantly enhancing health outcomes for MSWs within the LGBTQI+A community. A notable best practice from this project is using community-based LGBTQI+A and MSWs peer educators in collaboration with key population-friendly trained healthcare workers to bridge the gap between key populations and healthcare services.
Conclusions/Next steps: Integrating PrEP and STI health services in a single delivery model demonstrated significant benefits in reducing both HIV and STI incidences among MSWs within the LGBTQI+A community in Mangochi District, Malawi. This integrated approach serves as a practical framework for improving healthcare outcomes in key populations, especially for the LGBTQI+A and MSWs community and could be scaled up to enhance health outcomes for all.

EP0848

Does peer education and onsite HIV counselling and testing impact on the sexual behaviour of adolescents and youths in South East Nigeria?

U.C. Madubueze[1,2], P. Amiara[3], I.M. Okeke[1], B.N. Azuogu[1,4], L.U. Ogbonnaya[1,4]
[1]Alex-Ekwueme Federal University Teaching Hospital Abakaliki, Community Medicine, Abakaliki, Nigeria, [2]National Obstetrics Fistula Centre Abakaliki, Community Medicine and Public Health, Abakaliki, Nigeria, [3]Alex - Ekwueme Federal University, Medicine and Surgery, Abakaliki, Nigeria, [4]Ebonyi State University, Community Medicine, Abakaliki, Nigeria

Background: The high prevalence of HIV in Nigeria, estimated at 2.1% among the general population and 3.5% among adolescents aged 15–19 years, highlights the urgent need for targeted interventions. Adolescents face significant barriers to accessing HIV counseling and testing (HCT), including stigma, poor accessibility, and a lack of adolescent-friendly services.
This study evaluates the impact of peer education and on-site HCT services on sexual behavior amongst adolescents and youths in senior secondary school in Abakaliki, Nigeria.
Methods: This study was conducted in Abakaliki metropolis, South East Nigeria amongst senior secondary school students. A quasi-experimental study design was utilized, involving 466 students each in intervention and control groups. Peer educators were trained to disseminate accurate information on HIV and encourage positive sexual health practices. On-site HCT services were introduced in the intervention school, addressing logistical barriers to testing. A self-administered semi-structured questionnaire was used to collect data on sexual behavior and HCT uptake at baseline and three months post-intervention. The study duration was six months, data analysis and multivariate logistics regression was done using SPSS version 23.

Variables		Study group n = 466 No. (%)	Control group n = 466 No. (%)	X^2 (P Value)
Sex	Male	222 (47.1)	249 (52.9)	3.13 (0.08)
	Female	244 (52.9)	217 (47.1)	
Current Class	SS1	149(32.0)	162 (35.0)	1.20 (0.55)
	SS2	182(39.1)	167 (35.8)	
	SS3	135(29.0)	137 (29.3)	
Age	12-14	58(12.4)	61 (13.1)	13.8 (3.20)
	15-17	308(66.1)	258 (55.4)	
	18-20	99(21.2)	144 (30.9)	
	Above 20	1(0.2)	3 (0.6)	
Marital Status	Single	417(89.5)	407 (87.3)	2.98 (0.06)
	Married	25(5.4)	32 (6.9)	
	Separated	16(3.4)	16 (3.4)	
	Divorced	2(0.4)	5 (1.1)	
	Widowed	6(1.3)	6 (1.3)	
Type of Family	Polygamous	251 (53.9)	260 (55.8)	1.53 (0.47)
	Monogamous	210 (45.1)	204 (43.8)	
	Single Parents	5 (1.1)	2 (0.4)	

Results: The results revealed significant changes in sexual behavior and HCT uptake in the intervention group. The proportion of sexually active students decreased from

35.8% at baseline to 24.3% post-intervention, with consistent condom use among sexually active respondents increasing from 28.7% to 62.4%.
In contrast, the control group showed minimal change, with a slight decline in consistent condom use (30.1% to 28.5%, p<0.01).
There was statistically significant improvement in HCT uptake in the intervention than control group at post intervention.
Conclusions: This study demonstrates the effectiveness of integrating peer education with on-site HCT services in improving sexual health outcomes and HCT uptake among adolescents.
These findings provide evidence for scaling up similar interventions in Nigeria schools, contributing to national efforts to reduce HIV prevalence among adolescents.
Further research should explore long-term sustainability and the impact of such interventions on HIV incidence.

Implementation research to scale up prevention

EP0849

HIV transmission and associated factors among sexual partners of individuals newly diagnosed with HIV aged 15 years and above in North Eastern Uganda — a retrospective study

S. Ssentogo[1], B. Oryokot[1], D. Olweny[1], P. Sekiranda[1], A. Munina[1], J. Nalweyiso[1], P. Wadawa[1], D. Nambi[1], N. Karugaba[1], B. Bakashaba[1]
[1]AIDS Information Center, Directorate of Program Management and Capacity Development, Kampala, Uganda

Background: Despite the progress made in access to HIV testing services, an estimated 5.4 million people living with HIV(PLHIV) remain undiagnosed. The World Health Organisation recommends efficient innovative approaches like Assisted partner notification(APN) to improve HIV case identification and treatment initiation.
This study aimed to determine the effectiveness of APNs in improving HIV case finding and identifying predictors of HIV transmission among newly HIV-diagnosed individuals in the Teso region, North Eastern Uganda.
Description: From January 2023-September 2024, individuals aged 15 years above newly diagnosed with HIV (index clients) in 20 health facilities in the Teso region who consented were offered APN, where their partners were line-listed, tracked, and tested for HIV. Data on the index clients and their corresponding partners tested was collected from the APN register using a designed tool.
The primary outcome was the HIV positivity of the partners tested. Data was exported to STATA 18 (StataCorp LP,College Station, TX, USA) analyzed and summarized into proportions and frequencies.
Logistic regression analysis was conducted to determine determinants among index clients associated with transmission of HIV to their partners, which were reported as adjusted odd ratios (aOR). A p-value of 0.05 was considered significant.
Lessons learned: A total of **1,115** index clients with at least one partner tested for HIV were included in the study. The median age of clients was 38(interquartile range 29-45). Of which 58.74% (n=655) were females, 70.58% (n=787) were aged 25-49 years, and 38.68% (n=431) preferred to self notification of partners for testing. The HIV positivity among partners tested was 18.74% (n=209).
Factors associated with HIV transmission to partners included index client being males (aOR=1.76,95%CI; 1.27-2.42, P=0.001), Never married (aOR=1.95,95%CI;1.17-3.28,P=0.025), being on ART ≤ one year (aOR=3.75,95%CI;2.27-6.19, P=0.001), having multiple sexual partners (aOR-=1.88,95%CI;1.34-2.65,P=0.001), and receiving APN for the first time (a0R=2.01,95%CI;1.04-3.89, P=0.038).
Conclusions/Next steps: There was a high HIV transmission from individuals newly diagnosed with HIV. Index clients being male, on ART for ≤ one year, never married, having Multiple Sexual Partners, and receiving APN for the first time were more likely to transmit HIV to their partners. Therefore there is a need to scale HIV prevention services for high-risk populations to end the HIV epidemic by 2030.

EP0850

Community perspectives on HIV and STI doxycycline Post Exposure Prophylaxis: lessons from community consultations for effective program development in Andhra Pradesh, India, 2024

C. Kechamada Uthappa[1], J. Williams[2], V. Armugam[2], C. Subramaniam[2], V. Pakkela[2], R. Bhatia[3], P. Nadol[1]
[1]U.S. Centers for Disease Control and Prevention (CDC), India Office, U.S. Department of Health and Human Services (HHS), Delhi, India, [2]Voluntary Health Services (VHS), Chennai, India, [3]U.S. Centers for Disease Control and Prevention (CDC), U.S. Department of Health and Human Services (HHS), Atlanta, United States

Background: HIV and sexually transmitted infections (STI) remain prevalent among key populations (KPs) in India, highlighting the need for accessible post-exposure prophylaxis (PEP) services. Access and uptake to biomedical prevention tools, such as HIV PEP and doxy PEP for STIs, remain limited in India. To strengthen these interventions, we conducted community consultations with KPs in Andhra Pradesh (AP) to understand communities' perception, awareness, acceptance, preferred service delivery models, and barriers to HIV PEP and doxy PEP uptake providing critical insights for designing community-centered interventions.
Description: The consultations were carried out during November 18-24, 2024, among one stop center clinic attendees across AP using a semi structured discussion guide. Twelve consultations included 150 participants: 71 Female Sex Workers (FSW), 67 Men who have Sex with Men (MSM) and 12 People who Inject Drugs (PWIDs).

Lessons learned: Limited baseline awareness of HIV PEP (1%) and no prior knowledge of Doxy PEP was observed. All participants reported at least one incident that warranted HIV and/or doxy PEP use in the last year.
Preferences for service delivery included One-stop centers and community-friendly dispensing models. FSW preferred pharmacy models, while MSM feared discrimination from pharmacy staff.
Cost was identified as a significant barrier, with over 90% of participants suggesting less than $5 for a course of HIV PEP to make it accessible to all. MSM feared discrimination as doxy PEP is currently indicated only for them.
Discomfort in discussing condomless sex with providers, due to stigma and judgment, was widespread (70%). Concerns about stigma and confidentiality influenced preferences for discreet packaging (45%) and community-friendly providers (70%).
With the availability of multiple prevention options, communities highlighted confusion about when and how to use HIV PEP, doxy PEP, and Post Exposure Prophylaxis.
Conclusions/Next steps: Community consultations highlighted indication for, and challenges in accessing HIV and doxy PEP services in India. The findings underscore the importance of developing community-friendly delivery models; increasing PEP literacy; and affordable pricing. KP-competent programs ensure stigma-free and confidential access to PEP; and accessible service delivery through existing channels, including community-friendly models, will be developed to enhance access and uptake for PEP in AP.

EP0851

Lessons learned in Pre-Exposure Prophylaxis provision among pregnant and breastfeeding women

J. Chansa[1], C. Shava[1], F. Lipita[1], A. Musonda[1], F. Kunda[1], A. Mumba[1], M. Mukumba[1], O. Luneta[1], E. Mwiinga[1], M. Chitambo[1], D. Mwansa-Zulu[1], X. Bean[2], S. Chirwa[2]
[1]Meharry Medical College Global Health and HIV Clinical Services, Lusaka, Zambia, [2]Meharry Medical College, Nashville, United States

Background: Pregnant and Breastfeeding women (PBFW) face an elevated risk of HIV acquisition due to various biological, social and behavioral factors. Incident HIV acquisition has been linked to an increased risk of mother-to-child transmission (MTCT). Pre-Exposure Prophylaxis (PrEP) has proven effective in reducing HIV acquisition among at-risk populations, including PBFW.
The Health Resources and Services Administration under the U.S. President's Emergency Plan for AIDS Relief–supported initiative: *Leveraging Health Service Equity for Sustainable HIV Epidemic Control* aims to enhance healthcare for mothers by promoting PrEP uptake among at-risk PBFW to lower maternal HIV acquisition and subsequently reduce MTCT.
Description: The initiative which has been running since October 2022 to date in the Maternal and Child Health units of four high volume district hospitals in Lusaka, employs a multidisciplinary team of clinical, data and support staff working in partnership with Zambian Ministry of Health staff to provide care for PBFW living with HIV and their babies aged ≤2 years. The team provides health education, 3-monthly retesting (as per national guidelines) and ensures screening and enrolment for PrEP using a PrEP screening register which captures demographics, HIV risk assessment, eligibility and reasons for PrEP refusal. Screening data for all PBFW who declined PrEP between January-June, 2024 were reviewed.
Lessons learned: Of the 15,247 PBFW (antenatal=52.0%, postnatal=48.0%) screened for PrEP eligibility, 4159 (27.3%) were found eligible with 757 (18.2%) enrolling and 3402 (81.8%) declining PrEP respectively. Declines were higher among antenatal (56.7%) compared to postnatal (43.3%) mothers. The median age of those that declined was 27 years with 34.7% of these being adolescent girls and young women. Key risk factors identified included partner HIV status unknown (44.5%), long distance relationship (34.8%) and inconsistent use of condoms with other risk (6.3%).
Reasons for refusal included unwillingness to take pills (38.8%), low perceived HIV risk (25.5%) and fear of partner disapproval/stigma/violence (23.0%). Other reasons accounted for 12.7%. Most women (61.8%) chose condoms for prevention.
Conclusions/Next steps: Improving PrEP adoption among at-risk PBFW requires multifaceted strategies addressing PrEP formulations (pills and dosing), health education to improve risk perception and raising awareness to reduce stigma and violence in homes and communities.

EP0852

Implementation and retention outcomes of subsidized PrEP delivery models among key populations in Andhra Pradesh, India

J. Williams[1], A. Vijayaraman[1], S. Chandrasekaran[1], P. Venkateswara Rao[1], B. Aparna[1], P. Raghavendra Kumar[1], R. Shanmuganathan[1]
[1]The Voluntary Health Services, Chennai, India

Background: Pre-exposure prophylaxis (PrEP) is a cornerstone of HIV prevention, particularly for key populations (KPs) disproportionately affected by HIV in India. PrEP uptake remains suboptimal due to systemic, social, and individual barriers. We evaluate the implementation of structured PrEP delivery program in Andhra Pradesh, to identify opportunities for program optimization.
Description: From June 2022 to March 2024, comprehensive PrEP program was implemented across Andhra Pradesh, targeting KPs, including Transgenders (TG), Female Sex Workers (FSW), People who Inject Drugs (PWIDs), and Men who have Sex with Men (MSM).
Data on sociodemographic profiles, risk behaviors, and health parameters was collected as part of routine program monitoring.
Participants accessed PrEP through one of three delivery models: One-Stop Centers (OSC), Preferred Private Providers (PPP), and Tele-PrEP. Retention rates were tracked through monthly follow-ups, assessing adherence, and barriers to continued use.

Lessons learned: Reasons for discontinuation (n=363; 30.5% of those initiated) included recurrent out-of-pocket expenses (84; 23.1% of those who stopped), cessation of risk behavior (121; 33.3%), and side effects (6; 1.7%). Tele-PrEP models engaged younger participants but were underutilized compared to OSC delivery models, which were preferred for confidentiality and convenience.

PrEP Treatment Cascade	Frequency	Percentage
Information on PrEP	70,901	100%
Expressed interest in PrEP	6,620	9.3%
Assessed as ready to initiate PrEP	1,235	18.6% of those interested
Started PrEP	1,188	96.2% of those assessed
Key Populations (KPs) initiated		
MSM	280	23.6% of those initiated
FSW	254	21.4% of those initiated
TG	143	12.0% of those initiated
PWID	3	0.3% of those initiated
Follow-up Retention		
Completed at least one visit	535	45.0% of those initiated
Completed three visits	179	15.1% of those initiated
Completed six visits	70	5.9% of those initiated
Never attended follow-up	653	55.0% of those initiated
Typology-wise Retention		
MSM	106	38.0% of MSM initiated
FSW	89	35.0% of FSW initiated
TG	48	33.6% of TG initiated

Table 1: PrEP Treatment Cascade and Follow-Up Retention Among Key Populations in Andhra Pradesh, India.

Conclusions/Next steps: The implementation of subsidized PrEP delivery models among KPs demonstrated strong potential for scaling HIV prevention, with high initiation rates among those assessed as ready. However, retention declined over time, with many individuals discontinuing due to challenges such as out-of-pocket expenses, cessation of risk behavior, and stigma. OSC delivery models emerged as the most preferred option for their confidentiality and convenience, while Tele-PrEP showed promise for engaging younger participants but remained underutilized. These findings emphasize the need for targeted strategies to improve retention, address adherence barriers, and expand access through innovative delivery models like Tele-PrEP and PPP, providing valuable insights to optimize PrEP programs in resource-limited settings.

EP0853

The perceived acceptability and feasibility of delivering injectable PrEP among pharmacy providers in Kenya: findings from a survey of pharmacy providers trained on oral PrEP delivery

B.W. Nzuki[1], C. Kiptinness[1], T. Kareithi[1], E. Gichuru[1], E. Bukusi[2], V. Omollo[2], L. Juma[2], P. Otieno[2], D. Were[3], P. Ongwen[3], S.D. Roche[4], K. Harkey[4], P. Banerjee[4], R.C. Malen[4], K. Ngure[1,5], K.F. Ortblad[4]

[1]Partners in Health Research and Development, Center for Clinical Research, Kenya Medical Research Institute, Nairobi, Kenya, [2]Kenya Medical Research Institute, Kisumu, Kenya, [3]Jhpiego, Nairobi, Kenya, [4]Public Health Sciences Division, Fred Hutchinson Cancer Center, Seattle, United States, [5]School of Public Health, Jomo Kenyatta University of Agriculture and Technology, Kiambu, Kenya

Background: New long-acting injectable HIV pre-exposure prophylaxis (PrEP) products have demonstrated effectiveness and plans for scale-up are happening across Africa. Pilot studies have demonstrated that community pharmacies can reach individuals engaging in behaviors associated with HIV risk and that oral PrEP delivery is achievable in this setting.

We sought to understand how feasible and acceptable Kenyan pharmacy providers anticipate it would be to deliver injectable PrEP.

Methods: As part of the Pharm PrEP cRCT—a 60-pharmacy cluster-randomized controlled trial testing different models of pharmacy-based oral PrEP delivery or referral in Western and Central Kenya (NCT05842122), we trained pharmaceutical technologists and Pharmacists on oral PrEP. In baseline surveys, we presented providers with statements derived from the Theoretical Framework of Acceptability (TFA) and the Feasibility of Intervention Measure (FIM) and asked them to indicate their level of agreement on a five-point Likert scale.

Additionally, we assessed their willingness to deliver injectable PrEP (yes/no/maybe) and amount they would charge clients per injection if pharmacies received the drug for free. We descriptively analyzed and reported our findings.

Results: From July 2023-November 2024, we surveyed 105 providers; 55% (58/105) were men, 75% (79/105) pharmaceutical technologists, median age was 33 years (IQR 20-58), and median years working in pharmacy care was 7 (IQR 0-28). Most providers (≥94%, 99/105) agreed or strongly agreed that they liked the idea of delivering injectable PrEP (TFA construct: affective attitude) and that it would be doable at their pharmacies (FIM).

Few providers (≤8%, 8/105) agreed or strongly agreed that delivering injectable PrEP would be hard (TFA construct: burden) or interfere with their other priorities (TFA construct: opportunity cost).

Almost all providers (93%, 98/105) expressed willingness to deliver injectable PrEP. The median amount they anticipated charging per injection was the equivalent of ~$3.50 USD (IQR $1.50-3.50).

Conclusions: Kenyan pharmacy providers trained on oral PrEP perceived that delivering injectable PrEP at pharmacies would be highly acceptable and feasible for them,

with most expressing willingness to deliver it at a price that would be affordable for many clients. Countries seeking to quickly scale up injectable PrEP services should explore ways to leverage private pharmacies.

EP0854

Improving access to HIV services with virtual health interventions among key populations in Myanmar

T. Yamin Pyone[1], L. Htet[1], L. Aung Thu[1], P.P. Phyo[1], K.K. Lay[1], M. Kyaw Kyaw[1], K. Phyo Naing[1]
[1]Community Partners International, HIV/TB Agency, Information, and Services (AIS) Activity, Yangon, Myanmar

Background: In Myanmar, HIV prevalence is significantly higher among key populations: 34.9% in PWIDs, 8.8% in MSMs, and 8.3% in FSWs (UNAIDS, 2021) than in the general population (less than 1%). Reaching KP with linkage to HIV prevention and treatment services is critical to reducing the HIV burden in the country. AIS and its implementing partners are providing HIV prevention, care, and treatment for key populations in five high-burden regions in Myanmar.

Although most clients can be reached through routine HIV prevention activities, there are some hidden KP who are still not accessing health care services. To address this gap, AIS and its implementing partners started virtual key population service centers (KPSC) to reach hidden and hard-to-reach KP.

Description: In September 2023, AIS supported two implementing partners, Population Services International (PSI) and Medical Action Myanmar (MAM), to start virtual KPSC activities that include trained peer online teams to reach clients through social media channels such as , hotline, Facebook, Viber, Telegram, and dating apps. The teams provided one-to-one online/hotline counseling, Tele PrEP service, HIV testing, and referrals and linkage to facilities with an online booking system.

With this practice, clients do not need to come to the facility unless necessary, and it can save travel time, cost, and time. It also reduces the stress of the clients who are reluctant to come to the facility due to confidentiality.

Lessons learned: From September 2023 to September 2024, virtual KPSCs achieved HIV testing to 1,893 clients (1,560 MSM, 86 TGW, and 247 FSW), identified 219 HIV-positive cases with a positive yield of 11.5% (192 MSM, 10 TGW, and 17 FSW), linked 232 clients (96%) to ART. 405 clients were linked with PrEP service.

Conclusions/Next steps: Virtual health interventions are effective for reaching and providing HIV services for key populations, especially hidden and hard-to-reach population.

More comprehensive services like mental health screening and counseling should be integrated into virtual health services.

Virtual interventions could also be expanded geographically and integrated with existing HIV service provision nationwide.

EP0855

Broadening entry points for HIV testing and care through digital solutions: insights from PSI Myanmar's Care Connect HIV health education chatbot

E.M. Soe[1], Z. Kyaw[2], P. Thu[1], P. Aung Win[2], M.Y.Z. Aung[1], H. Aung Khant[2], K. Hatzold[3]
[1]Population Services International, HIV Department, Yangon, Myanmar, [2]Population Services International, Health Security and Innovation Department, Yangon, Myanmar, [3]Global Population Services International, HIV/TB/Hepatitis, Cape Town, South Africa

Background: Key populations in Myanmar face significant barriers to accessing essential HIV services, often remaining hidden and disconnected. According to UNAIDS, over one-third of reporting countries stated that more than 10% of key population respondents avoided health care due to stigma and/or discrimination. To address this issue, Population Services International (PSI) Myanmar launched the "Care Connect" HIV health education chatbot to provide confidential HIV health information and promote self-care.

Description: An HIV chatbot was developed in local language and hosted on the widely used Telegram platform in April 2024 to reach hidden key populations, following the country's Facebook ban. The topics covered included general HIV knowledge, HIV self-testing (HIVST), pre- (PrEP) and post- (PEP) exposure prophylaxis, and antiretroviral therapy (ART). To protect user confidentiality, questions on age, sex and gender identity were made optional.

User engagement and the most searched topics were tracked to assess effectiveness. The platform was promoted on social media commonly frequented by key populations. A hotline number was provided for in-depth discussion and referrals.

Lessons learned: The HIV chatbot engaged 2,036 users between April 4, 2024, and January 3, 2025, with an average of 255 users per month. The most frequently accessed topics were general HIV knowledge (42%) and self-testing (31%) followed by PrEP (11%), ART (10%) and PEP (6%). This finding indicates a growing interest in self-testing, despite the limited distribution of free test kits in the country, which has yet to meet the demand.

The available data suggests a male dominance in HIV health-seeking behavior (77.3%). An interview with the hotline doctor revealed challenges in referring clients for free non-occupational PEP due to limited services in the country.

Conclusions/Next steps: Care Connect HIV chatbot successfully broadened access to HIV information and care for key populations. It revealed higher interest in general HIV knowledge and self-testing, while less searched topics may require further promotion. The male dominance in usage of the chatbot suggests more targeted interventions for high-risk female population. Chatbot driven linkage to care requires further improvement. These insights will guide our future efforts to promote free chatbot-initiated HIV self-testing and linkage to HIV prevention and care services.

EP0856

The fidelity, acceptability, and feasibility of a peer PrEP referral with HIV self-testing model among young Kenyan women

N. Wairimu[1], C. Culquichicon[2], I. Njeru[1], M. Mwangi[1], R.C. Malen[3], A.M. Reedy[3], A. Muthoni[1], D. Kiboi[1], S. Njoroge[1], M. McGowan[4,5], F. Gao[6], K. Ngure[7], K.F. Ortblad[3]
[1]Partners in Health Research and Development, Center for Clinical Research, Kenya Medical Research Institute, Nairobi, Kenya, [2]University of Washington, Department of Epidemiology, Seattle, United States, [3]Fred Hutchinson Cancer Center, Public Health Sciences Division, Seattle, United States, [4]Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany, [5]Stellenbosch University, School for Data Science and Computational Thinking, Stellenbosch, South Africa, [6]Fred Hutchinson Cancer Center, Vaccine and Infectious Diseases Division, Seattle, United States, [7]Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya

Background: The behaviors of adolescent girls and young women (AGYW)—a priority population for HIV service delivery in Africa—are often influenced by their peers. To increase uptake of oral HIV pre-exposure prophylaxis (PrEP) among Kenyan AGYW, we tested a model of peer PrEP referral with HIV self-testing (HIVST) delivery in a cluster-randomized controlled trial (cRCT).
Methods: In the Peer PrEP cRCT, AGYW (≥16-24 years) who used PrEP (past 12 months) were recruited to refer four peers to PrEP. Index peers were randomized 1:1 to: 1) *enhanced referral*, where they received group training on referral strategies, eight HIVST kits (two/referred peer), and four PrEP referral cards (with information on nearby clinics), or 2) *standard referral,* where they received four referral cards.
Three months later, index and referred peers completed surveys assessing the fidelity of peer referral—per study arm assignment—and their perceived acceptability and feasibility of enhanced peer referral.
We report the percentage of participants that agreed or strongly agree (on 5-point Likert scales) with statements based on the Theoretical Framework of Acceptability (TFA) and Feasibility of Intervention Measure (FIM).
Results: From May 2023-August 2024, we enrolled 165 AGYW (median age 22 years; IQR 20-23): 82 index peers (40 enhanced; 42 standard) and 83 referred peers (55 enhanced; 28 standard). Most referred peers reported receiving all the appropriate materials from index peers (enhanced: 84%; standard: 86%). Most participants reported liking the enhanced peer referral model (≥88%; TFA: affective attitude) and were confident in theirs/peers' ability to implement the intervention (≥95%; TFA: self-efficacy). Few AGYW thought the intervention was hard to deliver/receive (≤8%; TFA: burden) or interfered with other priorities (≤1%; TFA: opportunity costs). Most participants thought the intervention was possible to implement (≥90%; FIM). There were no differences in outcomes by study arm.
Conclusions: In the Peer PrEP cRCT, peer PrEP referral was delivered with high fidelity and enhanced referral was perceived as acceptable and feasible among participants. These findings suggest that Kenyan AGYW are able and willing to refer their peers to PrEP with HIVST, highlighting the need to optimize this strategy to increase PrEP coverage.

EP0857

Acceptability of HIV pre-exposure prophylaxis delivery at private pharmacies in Kenya: a qualitative study of client and pharmacy provider experiences

N. Wairimu[1], B. Kwach[2], P. Mogere[1], V. Omollo[2], A. Dollah[2], J. Odoyo[2], J.M. Baeten[3,4], K. Ngure[5], K.F. Ortblad[6], S.D. Roche[6]
[1]Partners in Health Research and Development, Center for Clinical Research, Kenya Medical Research Institute, Nairobi, Kenya, [2]Centre for Microbiology Research, Kenya Medical Research Institute, Nairobi, Kenya, [3]University of Washington, Department of Global Health, Seattle, United States, [4]University of Washington, Department of Medicine, Seattle, United States, [5]Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya, [6]Fred Hutchinson Cancer Center, Public Health Sciences Division, Seattle, United States

Background: Kenya is one of several countries exploring ways to leverage the private sector for HIV service delivery. A pilot study of pharmacy-delivered oral HIV pre-exposure prophylaxis (PrEP) services in Kenya found high uptake and continuation comparable to public HIV clinics. To understand the acceptability of this delivery model among clients and pharmacy providers, we conducted in-depth interviews (IDIs).
Methods: This pilot was conducted between November 2020-December 2021 at 5 pharmacies in Kisumu and Kiambu counties in Kenya. Near study endline, we purposively sampled and interviewed clients ≥18 years — all of whom paid 300 Kenyan shillings (KES) [~$3 USD] for PrEP — and licensed pharmaceutical technologists who delivered PrEP. We used semi-structured interview guides informed by the Theoretical Framework of Acceptability (TFA) and analyzed transcripts thematically.
Results: We interviewed 39 PrEP clients and 6 pharmacy providers; 53% (24/45) were female and median age was 30 years (IQR: 23-35). All interviewees reported liking pharmacy-based PrEP delivery in general; clients liked the privacy, convenience, fast service times, and quality of services, while providers liked getting new clients and increased profits (TFA: affective attitude).
Most providers described PrEP delivery workload as manageable, but several anticipated charging more for their time in the future. Despite paying 300 KES for PrEP, several clients said this fee was not affordable and suggested reducing it to 100-200 KES [~$ 1-2 USD] (TFA: burden).
Only one provider reported ethical issues and stopped PrEP delivery after 3 months because it brought HIV stigma to her pharmacy (TFA: ethicality).
Most providers thought availing PrEP at pharmacies was a good way to reduce HIV incidence (TFA: perceived effectiveness), as many clients are sexually active and pharmacy providers already possess basic skills required for

PrEP delivery (TFA: intervention coherence). All providers reported confidence in their ability to deliver PrEP (TFA: self-efficacy).

Conclusions: Pharmacy clients and providers in this study perceived this delivery model as acceptable on multiple dimensions, suggesting that pharmacies could be an acceptable PrEP delivery platform in Kenya.

Future research should explore model adaptations that could affect acceptability (e.g., client fee amount) and assess impact on model adoption and sustainability.

EP0858

Acceptability of integrating novel PrEP products within reproductive health clinics in central Kenya: perspectives of adolescent girls and young women, healthcare providers, and program leaders

E. Owidi[1], K. Ngure[2,3], D. Mwai[1], M. Gikwa[1], C. Cheptoo[1], L. Etyang[1], P.M. Smith[4], M. Mwangi[1], J. Nyokabi[1], C. Kiptinness[1], N. Mugo[5,3], R. Heffron[4]

[1]Partners in Health Research and Development, Center for Clinical Research, Kenya Medical Research Institute, Nairobi, Kenya, [2]School of Public Health, Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, [3]Department of Global Health, University of Washington, Seattle, Washington, United States, [4]Department of Medicine, University of Alabama at Birmingham, Birmingham, United States, [5]Center for Clinical Research, Kenya Medical Research Institute, Nairobi, Kenya

Background: Novel HIV pre-exposure prophylaxis (PrEP) products, including injectable cabotegravir and dapivirine vaginal ring, may address persistence and adherence-related barriers with oral PrEP, potentially yielding improved HIV prevention coverage. Integrating these tools into reproductive health (RH) clinics could expand reach to adolescent girls and young women (AGYW).

We conducted a qualitative study among AGYW, healthcare providers (HCPs), and program leaders (PLs) to gather insights on integrating novel PrEP products within RH clinics.

Methods: Between April-October 2024, we conducted focus group discussions (FGDs) and in-depth interviews (IDIs) with AGYW, HCPs, and PLs in Kiambu and Muranga counties, Central Kenya. Eligible AGYW were 18-35 years and had experienced receiving RH/PrEP services. HCPs/PLs were aged >18 years, with experience delivering or coordinating RH/HIV services.

Semi-structured interview guides were based on the Consolidated Framework for Implementation Research. Interviews were audio-recorded, comprehensive debriefing summaries prepared; and analysed thematically to explore perspectives on PrEP integration.

Results: Sixty-eight respondents (34 AGYW; 27 HCPs; 7 PLs) participated in 8 FGDs and 20 IDIs. Among AGYW, median age was 24 years (IQR:22-27), 94% had used contraceptive methods, and 82% had used oral PrEP. Among HCPs/PLs, median age was 43 years (IQR:37-49), 29 were female, and included 14 nursing managers, 10 nurses, and 7 county-level RH/HIV program leaders.

HCPs and PLs supported integration of novel PrEP products within RH clinics given RH providers' experience offering injectable contraceptives, serving the same eligible women (*compatibility*), and availability of equipment for PrEP delivery (*materials and equipment*).

Among AGYW, integration was perceived to improve privacy, reduce HIV clinic-associated stigma (*recipient-centeredness*), and offer convenient access to HIV and pregnancy prevention (*need*).

Perceived opportunities for integration included ongoing county-level service integration policies, and RH clinic-based oral PrEP delivery (*policies and laws*). Staffing and room shortage (*work infrastructure; space*), and clinic congestion (*recipient-centeredness*) were major anticipated challenges.

To facilitate integration, respondents suggested training RH providers on delivering PrEP—including novel PrEP products, and HIV counselling, incorporating HIV counsellors within RH, and providing youth-friendly services.

Conclusions: Our results suggest a potential acceptability of integrating novel PrEP products within RH clinics attributed to compatibility with clinic environments, perceived client benefits, and supportive policies.

EP0859

Awareness, attitudes, and practices regarding HIV PrEP and DoxyPEP: a cross-sectional survey of healthcare providers in Peru

A. King[1], A. Lankowski[2,3], M. León Paredes[4], A. Holguín[5], J.R. Lama[4], A. Duerr[2,3]

[1]City University of New York, School of Public Health and Health Policy, Community Health and Health Policy, New York, United States, [2]Fred Hutchinson Cancer Center, Vaccine and Infectious Disease Division, Seattle, United States, [3]University of Washington, Global Health, Seattle, United States, [4]Asociación Civil Impacta Salud y Educación, Lima, Peru, [5]Instituto Nacional de Enfermedades Neoplásicas, Lima, Peru

Background: In 2023, the Peruvian Ministry of Health introduced guidelines providing priority populations access to subsidized oral HIV pre-exposure prophylaxis (PrEP). Healthcare provider awareness is critical for successful PrEP implementation. Doxycycline post-exposure prophylaxis (DoxyPEP) is an evidence-based tool for bacterial STI control not yet formally adopted in Peru.

This study aimed to assess Peruvian provider perspectives on PrEP and DoxyPEP.

Methods: We conducted a cross-sectional, web-based survey of Peruvian providers from October-December 2024, assessing provider awareness, experiences, and concerns regarding PrEP and DoxyPEP. Poisson regression models were fit to estimate associations of PrEP and DoxyPEP awareness with socio-demographic and professional characteristics. Variables with $p<0.05$ in bivariate analysis were included in multivariate models.

Results: Among 323 respondents, 105 (33%) were physicians, 102 (32%) nurses, 48 (15%) midwives, and 31 (9.6%) pharmacists. Of 251 (78%) providers aware of PrEP, 63% worked in a facility providing PrEP and 55% had received

PrEP training. Of those working in PrEP-providing facilities, 87% endorsed concerns about PrEP stock-outs and 34% indicated that lack of staff training was a barrier to PrEP provision. The most common PrEP concerns were potential increase in 'risky' sexual behavior or STIs (36%) and antiretroviral resistance (26%).

Overall, 160 (50%) were aware of DoxyPEP; of these, 46 (29%) had recommended it. PrEP awareness was associated with LGBTQ+ identity, being a physician, ≥5 years' experience, working in HIV/STI services, and having a client population ≥50% MSM. DoxyPEP awareness was associated with being a physician and serving ≥50% MSM clients (Table).

Participant Characteristic	Total N=323	Aware of PrEP [Overall: 251/323 (77.7%)]		Aware of DoxyPEP [Overall: 160/323 (49.5%)]	
-	n/N (%) of Total, by predictor variable	Crude bivariate PR (95% CI)	Multivariate PR (95% CI)	Crude bivariate PR (95% CI)	Multivariate PR (95% CI)
Cisgender Female (vs Cisgender Male)	187/300 (62.3%)*	1.03 (0.91, 1.16)	-	0.88 (0.70, 1.10)	-
Age; median (IQR)^	35 (23 - 47)	**1.01 (1.00, 1.01)**	1.00 (0.99, 1.00)	1.00 (0.99, 1.01)	-
LGBTQ+ Identifying (vs Not LGBTQ+)	30/323 (9.3%)	**1.33 (1.24, 1.42)**	**1.19 (1.09, 1.30)**	**1.40 (1.05, 1.85)**	1.10 (0.83, 1.45)
Lima-Based (vs Not Lima-Based)	140/323 (43.3%)	**1.26 (1.12, 1.41)**	1.10 (0.98, 1.23)	**1.52 (1.22, 1.89)**	1.17 (0.92, 1.47)
Physician (vs Non-physician)	105/323 (32.5%)	**1.26 (1.14, 1.40)**	**1.26 (1.13, 1.40)**	**1.61 (1.31, 1.99)**	**1.55 (1.26, 1.92)**
5+ Years in Practice (vs <5 years)	137/323 (42.4%)	**1.19 (1.05, 1.35)**	**1.18 (1.03, 1.35)**	1.10 (0.88, 1.39)	-
HIV/STI Service Provider (vs Non-HIV/STI Provider)	272/323 (84.2%)	**1.44 (1.12, 1.83)**	**1.33 (1.05, 1.69)**	**1.48 (1.00, 2.18)**	1.29 (0.87, 1.90)
Client Population ≥50% MSM (vs <50% MSM)	105/323 (32.5%)	**1.29 (1.16, 1.43)**	**1.20 (1.07, 1.34)**	**1.66 (1.35, 2.04)**	**1.53 (1.23, 1.91)**

PR: prevalence ratio; 95% CI: 95% confidence interval; bold = statistically significant ($p < 0.05$)
* Note: The denominator for gender comparison is 300 instead of 323 because responses labeled as 'Other' and 'Prefer not to respond' were excluded from this analysis.
^ Per 1-year increment

Conclusions: Our results highlight challenges in PrEP implementation in Peru. Although most providers knew of PrEP, concerns about risk compensation, antiretroviral resistance, and insufficient training were common. Efforts should focus on strengthening supply chains and ensuring providers have access to evidence-based information. Providers are recommending DoxyPEP despite the absence of national guidelines, underscoring need for formal guidance.

EP0860

A systematic review of interventions to enhance the uptake of prevention of Mother-to-Child transmission services among Pregnant Women Living with HIV in Nigeria

A. Bafuwa[1], K. Kakanfo[1], H. Abdulsalaam[1], A. Isah[1], M. Ijaiya[1], L. Mfon[1], C. Onodugo[1]
[1]Africa Hub for Innovation & Development, Special Projects, Abuja, Nigeria

Background: The prevention of mother-to-child transmission (PMTCT) of HIV is a cornerstone in reducing pediatric HIV infections and improving maternal health outcomes. Even with the advancements in PMTCT interventions, challenges persist in ensuring the uptake and adherence of these services by pregnant women living with HIV (PWLHIV).

This study evaluates different interventions designed to improve PMTCT service uptake and adherence among PWLHIV in Nigeria.

Description: A systematic search of electronic databases, including PubMed, Web of Science, Scopus, Cochrane Library and African Journals Online (AJOL), was conducted for studies published between January 2010 and December 2024. Search terms included "PMTCT," "HIV," "pregnant women," "interventions," "uptake," "Vertical Transmission", "early infant diagnosis" and "Nigeria." Inclusion criteria were peer-reviewed studies assessing interventions to improve PMTCT service uptake, adherence to antiretroviral therapy (ART), or retention in care among pregnant women living with HIV in Nigeria. Data extraction followed PRISMA guidelines, and the methodological quality of included studies was evaluated using the Cochrane Risk of Bias Tool.

Lessons learned: Twenty-five studies met the inclusion criteria, encompassing a variety of intervention approaches. According to two of the studies integration of PMTCT services with antenatal care, training and task-shifting to community health workers improved accessibility, service delivery and increased uptake rates.

Some Journals of HIV/AIDS and social service indicates that community-based interventions, such as mobilization campaigns and male partner involvement, have shown to increase PMTCT service utilization.

Additionally, peer support groups can effectively address social barriers to care, such as stigma, and enhance treatment adherence among individuals living with HIV.

Another publication shows that mobile tracking solutions, such as SMS reminders and mobile appointment tracking, can effectively enhance retention within PMTCT programs.

Furthermore, economic incentives like conditional cash transfers and the provision of free transportation vouchers have been shown to increase clinic attendance and adherence to PMTCT protocols.

Conclusions/Next steps: In Nigeria, PMTCT uptake among PWLHIV, can be significantly improved through integrated health system approaches, community-based programs, and the use of mobile tracking Health tools. It is critical to optimize these interventions and also address barriers such as stigma and logistical challenges.

EP0861

Impact of a technology-based intervention to advance mental health empowerment among adolescents and young people (AYP) aged 15-24 years and accessing ART and PrEP: a quasi-experimental study in Kenya

H. Essendi[1], M. Nhamo-Murire[2], I. Masete[3], S. Malaba[4], L. Ogada-Wanaswa[5]
[1]Tiko, Monitoring, Evaluation, Research and Learning, Nairobi, Kenya, [2]Tiko, Johannesburg, South Africa, [3]Tiko, Monitoring, Evaluation, Research and Learning, Kampala, Uganda, [4]Tiko, Senior Leadership, Nairobi, Kenya, [5]Tiko, Kenya Country Team, Nairobi, Kenya

Background: Adolescents and young people (AYP) in sub-Saharan Africa face increasing mental health challenges, yet access to services remains limited due to stigma, lack of awareness, and systemic barriers. The magnitude is even higher among AYP on antiretroviral therapy (ART) and those on pre-exposure prophylaxis (PrEP).

Recognising the link between mental health and HIV, this study aimed to evaluate the impact of a technology-based mental health (MH) intervention integrated into HIV programming to enhance MH empowerment, self-esteem, and service uptake among AYP aged 15–24 years in Mombasa and Kilifi counties in Kenya.

The intervention employed the Tiko Platform, a digital platform that connects AYP to a network of community

health workers and facilities offering youth-friendly MH, HIV (testing, ART and PrEP) and family planning (FP) services. The program targeted stigma reduction, awareness creation, and service accessibility through tailored outreach, interpersonal group therapy (IPT-G), and subsidised service delivery.

Methods: Study design: A quasi-experimental design with non-equivalent comparison groups was used to compare intervention and control groups in three counties (Mombasa, Kilifi (intervention sites) and Kwale (control site)) which have a high prevalence of HIV. Data were collected from 1,874 AYP through surveys, facility records (HIMS database for the period between January 2021 and July 2024), and qualitative interviews to evaluate empowerment, self-esteem, depression, and service awareness.

Results: We employed propensity score matching and key findings included: AYP in the intervention arm were significantly more likely to report MH empowerment (91.0% vs. 68.9%), self-esteem (68.3% vs. 60.3%), and behavioral improvement (95.2% vs. 91.5%) compared to the control arm ($p<0.001$); MH awareness and knowledge were higher in the intervention arm (65.8% vs. 33.6%, $p<0.001$), and IPT-G sessions led to a significant reduction in moderate-to-severe depression (51.6% to 1.7%, $p<0.001$) and Factors influencing outcomes included age, employment, internet access, and facility engagement.

Conclusions: The integration of technology-based MH interventions into HIV programming shows significant potential to improve MH outcomes among AYP. MH and HIV service integration can reduce stigma, enhance empowerment, and promote service uptake. Future efforts should focus on scaling the intervention, strengthening community engagement, and addressing structural barriers to sustain long-term impact.

EP0862

Layering mental health screening and treatment on HIV prevention, care, and treatment improves access to pre-exposure prophylaxis among adolescents and young people in Mombasa County

H. Essendi[1], M. Nhamo-Murire[2], I. Masete[3], S. Malaba[4], L. Ogada-Wanaswa[5]

[1]Tiko, Monitoring, Evaluation, Research and Learning, Nairobi, Kenya, [2]Tiko, Johannesburg, South Africa, [3]Tiko, Monitoring, Evaluation, Research and Learning, Kampala, Uganda, [4]Tiko, Senior Leadership, Nairobi, Kenya, [5]Tiko, Kenya Country Team, Nairobi, Kenya

Background: The integration of mental health (MH) screening and treatment into HIV prevention programs has the potential to improve access to critical HIV services, including Pre-Exposure Prophylaxis (PrEP). In Kenya, adolescents and young people (AYP) aged 15–24 years face significant barriers to accessing these services, often exacerbated by untreated mental health conditions. This programme, funded by the Elton John AIDS Foundation (EJAF) and implemented by Tiko, aimed to address these challenges in Mombasa County by layering MH interventions with HIV prevention, care, and treatment services to improve PrEP uptake and adherence. he programme, implemented between May 2022 and April 2023, targeted AYP in Mombasa and Kilifi counties in Kenya including among key populations (KPs) such as people who inject drugs, sex workers, and men who have sex with men (MSM).

Methods: Quantitative and qualitative data were collected through client surveys, facility surveys, focus group discussions (FGDs), and key informant interviews (KIIs). The quasi-experimental design compared outcomes in Mombasa with Kwale County, a non-intervention control site

Results:

1. AYP in Mombasa demonstrated significantly higher awareness of MH services (46% vs. 26% in Kwale) and PrEP services. They also scored higher on MH empowerment (mean score: 26.0 vs. 24.1; $p<0.001$).
2. New PrEP enrollments in Mombasa increased substantially during the intervention period, compared to no significant change in Kwale.
3. More AYP in Mombasa accessed PrEP alongside MH services, demonstrating the programme's success in linking these interventions.
4. Among AYP completing six IPT-G sessions, 74.5% achieved remission, with only 1.7% still experiencing moderate depression post-treatment.
5. Despite progress, stigma and lack of privacy in some facilities remained key barriers to PrEP and MH service uptake, particularly for younger AYP and those in key populations.

Conclusions: Layering MH interventions onto HIV prevention programs is an effective strategy to increase PrEP uptake and improve mental health outcomes among AYP. Future efforts should focus on strengthening the integration of MH screening and treatment within existing HIV service delivery platforms.

EP0863

U.S. client preferences to inform same-day HIV pre-exposure prophylaxis programs in medicaid expanded and non-medicaid expanded states - a discrete choice experiment

S.V. Hill[1], M. Parman[2], R. Brewer[3], C. Kemp[4], P. Thomas[5], T. Valeranio[5], L. Nelson[5], J. Ong[6], L. Herald[2], L. Elopre[2]

[1]Emory University, School of Medicine, Atlanta, United States, [2]University of Alabama at Birmingham, Birmingham, United States, [3]University of Chicago, Chicago, United States, [4]Johns Hopkins University, Baltimore, United States, [5]Yale University, New Haven, United States, [6]Monash University, Melbourne, Australia

Background: Human-centered approaches are needed to increase oral same-day HIV pre-exposure prophylaxis (PrEP) prescriptions and reduce disparities in HIV incidence in the United States (US). This study explored client preferences for same-day PrEP programs in three states that have and have not expanded access to the US public insurance program Medicaid.

Methods: Clients receiving care from clinics serving underserved communities in Illinois (Medicaid-expanded) and Alabama and Texas (Medicaid non-expanded) com-

pleted electronic discrete choice experiment surveys. Attributes included location (community clinic, primary care provider, health department, pharmacy, urgent care), first PrEP dose method (starter pack, prescription, injection), follow-up (in-person, phone), and visit cost (free, $10, $20, $30). Surveys were built in Sawtooth. Data were analyzed in NLogit using a conditional logit model with interactions [state, ever-used PrEP].

Results: 120 surveys were completed. Clients were mean (SD) 32 years old (8), 74% (N=89) male, 66% (N=79) Black, 12% ever-used PrEP, and 48% from Medicaid-expanded states. Visit cost was the most important attribute (Relative Importance = 58%) for same-day PrEP programs, regardless of Medicaid expansion status *(Figure 1)*. Medicaid-expanded state clients were less likely to choose the same-day PrEP programs offered (β=0.33, p=0.0003). Ever PrEP users were willing to pay $30 for visits compared to never PrEP users (β=0.37, p=0.0029). Ever-used PrEP clients did not prefer any offered same-day PrEP programs (β=0.36, p=0.024).

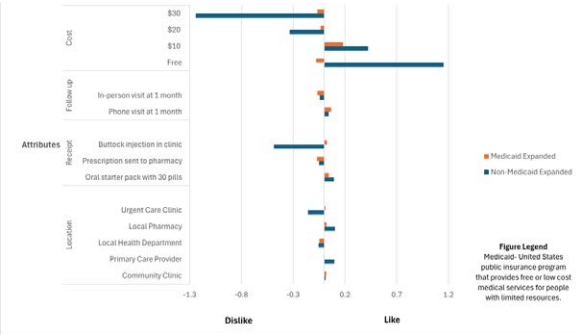

Figure 1. Preferences for same-day PrEP programs from United States clients in medicaid expanded and non-medicaid expanded states (N=120).

Conclusions: Broad strategies are needed to promote same-day PrEP programs. While ever-used PrEP clients did not have preferences likely due to their familiarity with visits, visit cost was the most important attribute to clients. Economic policies may potentially mitigate structural barriers (e.g. insurance coverage) that impact client PrEP use decisions. Policies making same-day PrEP affordable can increase PrEP uptake. Collaboration with multiple stakeholders on economic policies may also facilitate same-day PrEP program implementation by relieving misplaced burdens on community PrEP programs.

EP0864

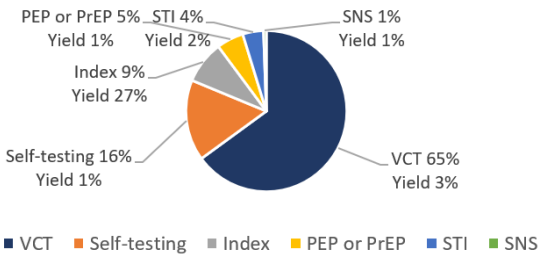
Diversifying HIV testing choices to increase case finding targets in five Brazilian cities, 2024

V.L. Cota[1], M. M. da Cruz[1], L. R. B. Rosso[2], R. Zonta[3], M. Paiva[4], A. Silva[5], D. A. R. da Silva[6], J. B. A. Neto[7], T. H. S. Nascimento[7]

[1]Oswaldo Cruz Foundation - Fiocruz, National School of Public Health, Rio de Janeiro, Brazil, [2]Curitiba Health Department, Curitiba, Brazil, [3]Florianopolis Health Department, Florianopolis, Brazil, [4]Fortaleza Health Department, Fortaleza, Brazil, [5]Campo Grande Health Department, Campo Grande, Brazil, [6]Porto Alegre Health Department, Porto Alegre, Brazil, [7]Ministry of Health, HIV Department, Brasilia, Brazil

Background: The Time is Now Project, implemented by Fiocruz with PEPFAR funding, supports differentiated HIV testing choices in five cities to expand HIV case finding in Brazil. In 2015, the project introduced HIV-self testing (HIVST) as a pilot initiative and now offers six distinct case-finding models: HIVST mail delivery, index testing, voluntary counselling, and rapid testing in health facilities (VCT), during PEP, PrEP and STI consultations, and social network strategies (SNS).

Description: These modalities of HIV testing are provided free of charge across five cities: Campo Grande, Curitiba, Florianopolis, Fortaleza, and Porto Alegre. In FY2024, the project conducted 29,000 HIV tests identifying 1,156 positive cases. Among the number of PLWHA identified, 65% (575/885) were through VCT, 16% (144/885) via HIVST screening, 9% (76/885) through index testing, 5% (48/885) during initial PrEP/PEP screening, 4% (37/885) after STI screening, and 1% (5/885) through SNS *(Graphic 1)*. Data came from site confirmatory testing records and national health systems.



Graphic 1. HIV testing: Contributions and positivity by modality, Brazil. July - Sep 2024.

Lessons learned: HIV positivity and population group reached varied by testing modality. Higher volume and positivity of tests occurred among MSM *(Graphic 2)*.

Graphic 2. HIV testing and yield by population, Brazil. July - Sep 2024.

Index testing yielded the highest positivity rate at 27% *(Graphic 1)*, effectively identifying cases among heterosexual men and individuals with advanced disease.
Higher positivity rates of HIVST were found among transpeople (3.1%; 3/96) and women over 40y.o. (4.3%; 2/46).
Conclusions/Next steps: HIVST is an important entry point for individuals who don't access health facilities. Index testing provides highly effective cases identification. A diversity of HIV testing options is complementary to reach various populations. Refining SNS strategies could enhance positivity rates.

EP0865

Implementing short-course tuberculosis preventive therapy (1HP) among People living with HIV in routine program setting, Andhra Pradesh, India, 2024

M. Thogarucheeti[1], S. Attada[1], K. Prasad[1], R. Allam[2], N. Chava[3], G. Ramesam[3], R. Praveen[3], P. Ajit[3], J. Kurada[3], V. Yeldandi[3], P. Tураka[3], P. Rajendra Prasad[3], S. Chakravarthy[1], P. Nadol[2]
[1]Andhra Pradesh State AIDS Control Society, Vijayawada, India, [2]U.S Centres for Disease Control and Prevention, DGHT, Delhi, India, [3]Society for Health Allied Research & Education India, Hyderabad, India

Background: India accounts for 26% of tuberculosis (TB) cases and 6.3% of people living with HIV (PLHIV) globally. India's National TB Elimination Program recommends using a one-month TB preventive therapy (TPT) regime of daily isoniazid plus rifapentine (1HP). To enhance TPT completion rates compared to that of conventional six-month isoniazid monotherapy (6H), 1HP was initiated in select high-burden antiretroviral therapy clinics (ARTC) in Andhra Pradesh to document implementation feasibility and outcomes, i.e., TPT initiation and completion.
Description: In nine ARTC, we trained the staff on technical and operational aspects of 1HP, reporting tools, follow-up of adverse events, and treatment completion. Indications for 1HP initiation included: PLHIV with negative TB four-symptom screen, history of contact with drug-sensitive TB, aged >13 years, and on ART regimens other than protease inhibitors. From July-October 2024, ARTC counsellors contacted PLHIV by phone on day 14 of TPT to assess pill adherence and monitoring of side effects of 1HP.
During the subsequent ART pill pick-up visit, counsellors confirmed the completion of 1HP pill intake and PLHIV were actively asked to recall the number of pills missed during the latest week to cross-check adherence.
We analyzed routine program data to determine 1HP initiation and completion rates and compared them to historical (July-October 2023; n= 1,421) 6H completion rates.
Lessons learned: A total of 3,391 eligible PLHIV were initiated on 1HP. The median age was 43 (IQR:35-50) years, 52.4% were female, and 2.1% were newly initiated on during the period. Gender distribution and median age were similar among those initiated on 6H. By November 2024, 97.3% (3,302/3,391) completed 1HP; 89 did not complete: lost to follow-up (LFU) (40), death (13), transferred out (10), and discontinued due to side effects (26). Common side effects reported were nausea, vomiting, and tingling. The 1HP completion rates (97.3%; CI: 94.1-100) were significantly higher ($p<0.05$) than that of 6H [90.4% (149/1,421); CI: 90.0- 90.8). Discontinuation due to LFU (31%), transfer out (15%), died (1%), side effects (hypersensitivity, hepatotoxicity) 42%.
Conclusions/Next steps: PLHIV on 1HP demonstrated higher completion rates compared to 6H within routine program setting. National programs may consider offering 1HP at ART clinics to all eligible PLHIV.

EP0866

Making PrEP smart: persistence, use, and acceptability of a PrEP adherence and HIV-self testing app among women in the South Bronx, New York City

C. Wright[1], T. Chern[2], T. Abularrage[1], J. Franks[1], A. Kahn[1], S. Edwards[1], H. Harpaldas[2], R. Redd[1], A. Ying[2], S. Arumugam[2], R. Stanciu[2], S. Sia[2], E. Morrison[1], J. Justman[1]
[1]ICAP at Columbia University, New York, United States, [2]Columbia University School of Engineering and Applied Science, New York, United States

Background: HIV pre-exposure prophylaxis (PrEP) is underutilized by cis- and transgender women and adherence to PrEP is often suboptimal despite high HIV burden, especially among Black and Hispanic women. Smartphone technologies hold promise for supporting PrEP adherence but have not been evaluated extensively among women.
We conducted a 12-month pilot study in the South Bronx to assess acceptability and self-reported PrEP adherence among diverse HIV-negative women.
Methods: Adult transgender or non-pregnant cis-gender, PrEP-eligible women who reported inconsistent PrEP adherence or use for <3 months were eligible. Participants received PrEP (TDF/FTC or TAF/FTC), free HIV self-testing (HIVST) kits, and downloaded the "SmartPrEP" app which sent personalized daily adherence queries.
PrEP adherence was classified as ≥6, 3-5 and <3 self-reported weekly doses. App acceptability was scored by quarterly interviewer-administered questionnaire (1 lowest, 5 highest).
Results: From February 2022 to August 2023, 40 participants enrolled (median age 30 years), 70% (n=28) identified as cisgender women, 30% (n=12) as transgender women, 48% (n=19) as Hispanic, 35% (n=14) as Black; 83% (n=33) were not currently taking PrEP.
At baseline, 35% (n=14) believed they were at risk of HIV, despite 90% (n=36) reporting ≥1, and 25% (n=10) ≥ 4 HIV risk behaviors in the past 6 months. PrEP adherence was heterogenous, with 3% (n=1) reporting ≥6 doses/week, 17% (n=7) reporting 3-5, and 80% (n=32) reporting <3 doses/week (Figure).
Only 10% (n=4) conducted HIVST via SmartPrEP. Mean app acceptability score was 3.9 with 93% of participant responses endorsing the app. Median duration of follow-up was 180 days, with one HIV seroconversion and three pregnancies occurring over follow-up.

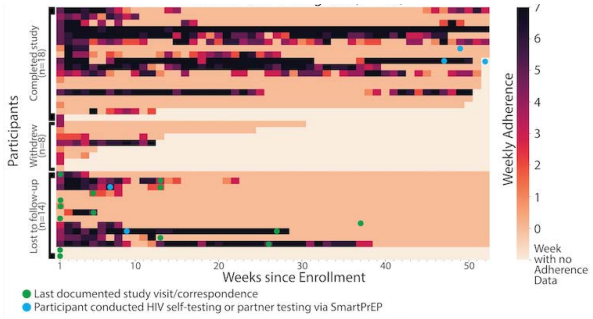


Figure. Heatmap of weekly PrEP adherence (# "yes" responses to daily dosing query per week) and HIV self-testing use (n = 40).

Conclusions: The study found low HIV risk perception and heterogenous PrEP adherence over 12 months of observation among these women at elevated risk of HIV, despite high app acceptability. As long-acting PrEP formulations become available, addressing gaps in risk perception among women remains critical.

EP0867

Perceptions of long-acting Lenacapavir as an alternative to HIV vaccine among cisgender female sex workers in Abuja, Nigeria

G. Ezenri[1,2], D. Attama[3], J. Onyehalu[1,2], A. Ngige[1,2], C. Idabor[1,2], C. Nwachuya[1,2], A. Isah[1,2]
[1]Person-Centred HIV Research Team (PeCHIVReT), Nsukka, Nigeria, [2]University of Nigeria, Clinical Pharmacy & Pharmacy Management, Nsukka, Nigeria, [3]University of Nigeria, Nsukka, Nigeria

Background: Cisgender female sex workers in Nigeria face significant barriers to HIV prevention; hence the need for innovative solutions. Long-acting lenacapavir offers a promising alternative to an HIV vaccine, addressing gaps in adherence and access.
This study assessed the perception of cisgender female sex workers on the use of Lenacapavir for HIV prevention as well as the barriers to its adoption.
Methods: This study adopted a cross-sectional design to obtain responses from 122 randomly sampled cisgender female sex workers in Abuja, Nigeria in January 2025 using a validated 24-item questionnaire. Their awareness of long acting lenacapavir, perception and beliefs as well as possible barriers, challenges and preferred rollout strategies were assessed. Descriptive and inferential analyses were used to summarize the study's findings. Ethical approval was obtained from the Institutional Review Board.
Results: A total of 110 cisgender female sex workers responded to the questionnaire (90.1 % response rate) with 67 (60.9%) being single and 45 (40.9%) have been a sex worker for 1-5 years. The Majority, 108 (98.2%), has not heard about lenacapavir as a long-acting HIV prevention method. Only 22 (20%), believe lenacapavir could serve as an effective alternative to an HIV vaccine with only 3 (2.7%) *very confident* in lenacapavir's ability to prevent HIV over six months. Almost half, 52 (47.3%), cited cost as a possible challenge that might prevent them from using lenacapavir and 78 (70.9%) think their community will accept lenacapavir. The majority, 94 (85.5%), think their community would be open to trying Lenacapavir as an early alternative to vaccine.
Conclusions: The majority of cisgender female sex workers are unaware of long-acting lenacapavir for HIV prevention, with only a small proportion expressing strong confidence in its effectiveness over six months. Cost remains an important barrier that could hinder widespread adoption.
To bridge this gap, stakeholders should prioritize further research, particularly focusing on willingness-to-pay studies and other economic considerations within this population, to inform tailored interventions and policy decisions that enhance accessibility and uptake.

EP0868

Retention on PrEP among highly vulnerable young women: identifying barriers and leveraging opportunities to improve adherence

S. Fogue Tiozang[1], G. Fako Hendji[1], S. Mabouna Amatagana[1], E. Abomo[1], I.L. Nna Banga[1], M. Tokam[1], A.A. Boupda Kuate[1], E. Lifanda[1], O. Gayou Leuyou[1], Z. Zeh Akiy[2]
[1]Care and Health Program, Yaoundé, Cameroon, [2]USAID, Yaoundé, Cameroon

Background: Pre-exposure prophylaxis (PrEP) is a key tool in reducing the risk of HIV transmission among vulnerable young women. However, low retention rates compromise the effectiveness of this intervention. This study explores the barriers to retention and identifies opportunities to enhance adherence in this target population.
Description: The analysis focused on an open cohort of 114 young women aged 21 to 24. Each participant was observed over a 12-month period during which they could choose to discontinue PrEP. Retention rates were calculated at months M1, M3, M6, M9, and M12. Reasons for discontinuation were grouped according to themes and presented as percentages.
Lessons learned: After 12 months, 46 participants had discontinued PrEP. Retention rates were 97% at M1, 94% at M3, 92% at M6, 80% at M9, and 60% at M12. The perception of no longer being at risk (54%) was the primary reason for discontinuation, accounting for more than half of the cases. Migration of participants outside the project's intervention zone represented 35% of discontinuations. Although less frequent (9%), side effects influenced retention on PrEP. Intimate partner violence accounted for 2% of PrEP discontinuations. Between the initiation of PrEP and the first month (M1), three participants stopped PrEP due to side effects such as itching, abdominal pain, and general fatigue.
Conclusions/Next steps: The data indicates that the perception of no longer being at risk of HIV (54%) and migration outside the intervention zone (35%) are the main reasons for discontinuing PrEP, highlighting the need for continuous education and addressing structural barriers. Although less frequent, side effects (9%) and intimate partner violence (2%) underscore specific clinical and psychosocial needs.

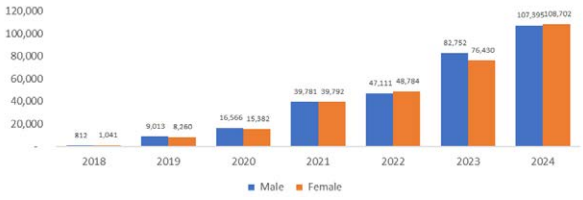
These findings emphasize the importance of strengthening PrEP education, ensuring service availability and continuity for mobile populations, and developing integrated strategies to address the medical and psychosocial needs of clients. By addressing these barriers, it is possible to improve retention and maximize the impact of PrEP on HIV prevention.

EP0869

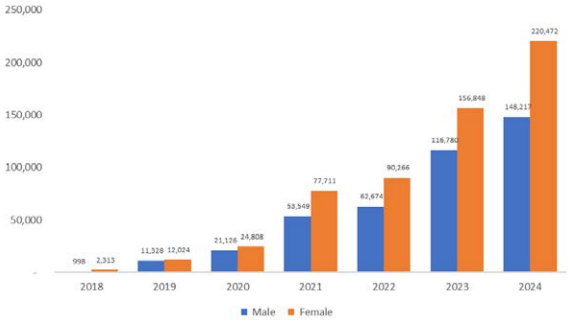
Optimizing uptake of HIV pre-exposure prophylaxis among men through effective demand generation and male-friendly services in Zambia

C. Mutila[1], M. Musonda[2]
[1]PEPFAR Coordination Office, U.S Government Department of State, Lusaka, Zambia, [2]Health Office, United States Agency for International Development, Lusaka, Zambia

Background: The 2021 ZAMPHIA reported 28,000 new HIV infections which declined to 23,000 in 2023 according to UNAIDS. New infections are driven mainly by heterosexual sex between HIV positive men 25+ and adolescent girls and young women aged 15-24 (AGYW).
Engaging men, who tend to shun health services, to uptake pre-exposure prophylaxis (PrEP) is critical to reducing HIV infections and pushing Zambia towards epidemic control.
This requires impactful a male-friendly services to increase uptake of PrEP among men aged 25+.
Description: PrEP was introduced in 2018 in Zambia with initial implementation seeing low uptake. In 2019, the Zambia Ending AIDS strategy emphasized the importance of taking control of one's sexual health to avert HIV acquisition. Demand generation was coupled with differentiated service delivery of PrEP, taking services out of HIV clinics into other service delivery platforms in the community.
Male community-based volunteers were capacitated to disseminate key messaging on PrEP and male healthcare providers were recruited for men's clinics as part of male-friendly service provision.
Lessons learned: In 2018, PEPFAR Zambia initiated 3,311 individuals on PrEP including 812 men aged >25 (25%), compared to 1,041 femen aged >25 (31%).
PrEP demand generation through Zambia Ending AIDS campaign in 2019 resonated with men, with PrEP initiations among men >25 surpassing women >25 with 9,013 and 8,260 respectively.



Since 2018, PEPFAR Zambia has initiated 999,114 individuals on PrEP, with men >25 accounting for 30% (303,430).



Conclusions/Next steps: If men utilize PrEP and avert new infections, it in turn reduces the number of new infections among AGYW.

EP0870

Diversifying PrEP delivery choices to enhance PrEP access in two cities of Brazil, 2020-2024

V.L. Cota[1], M. M. da Cruz[1], L. R. B. Rosso[2], R. Zonta[3]
[1]Oswaldo Cruz Foundation - Fiocruz, National School of Public Health, Rio de Janeiro, Brazil, [2]Curitiba Health Department, Curitiba, Brazil, [3]Florianopolis Health Department, Florianopolis, Brazil

Background: The Time is Now (A Hora e Agora) Project, implemented by Fiocruz with PEPFAR funds, supports differentiated pre-exposure prophylaxis (PrEP) service delivery choices in Florianopolis and Curitiba to expand oral PrEP access in Brazil. Since 2020, it has provided telehealth appointments and online messaging, with oral PrEP and HIV self-tests (HIVST) by mail delivery. By 2024, Curitiba and Florianopolis provided oral PrEP to around 2,500 and 2,660 users respectively.
Description: In 2020, Florianopolis began offering private online messaging between oral PrEP users and providers, using standard forms. Online messaging allows PrEP users to use services at their convenience, including non-business hours and weekends. STI screenings and online HIVST assistance are also offered. As another DSD model, Curitiba offers live virtual appointments through a city telehealth center since 2022. During TelePrEP, clients are supported to perform HIVST, followed by appropriate counseling and up to 120-day supply of oral PrEP by mail delivery. Both models include trained nurses, pharmacists, and doctors as prescribers. In 2024, HIVST home delivery was included for PrEP initiation, with clients sending results via digital photos for verification.
Lessons learned: In 2021, HIV specialized public health services comprised 96% of PrEP offer in Curitiba and 100% in Florianopolis. In 2024, TelePrEP was responsible for 53% of PrEP prescriptions in Florianopolis and 23% in Curitiba. Considering the first year of DSD PrEP offer, the number of young PrEP new users (15-24 y.o) in Florianopolis rose 145% (2020-2021), and in Curitiba, it was 47% higher (2022-2023). In both cities, DSD models were adapted based on existing healthcare infrastructure, available resources, and local contexts.
Conclusions/Next steps: The implementation of TelePrEP and PrEP-delivery integrated with HIVST were key factors contributing to the expansion of PrEP in both cities.

Further opportunities remain to use these approaches to address inequities in access among the transgender community, sex workers, and individuals using psychoactive substances. The choice for PrEP delivery by mail has still potential to be expanded, with the use of targeted social media.

EP0871

PrEP Choice in the real world: understanding preferences among sexually and gender-diverse youth in Northeastern Brazil

T. Aranha Rossi[1,2], F. Duarte[2], P. Caires[2], N. Suzart[1], L. Magno[1,2], E. Zucchi[3], D. Ferraz[4], A. Granjeiro[5], I. Dourado[2]
[1]State University of Bahia, Health Sciences, Salvador, Brazil, [2]Federal University of Bahia, Collective Health Institute, Salvador, Brazil, [3]Catholic University of Santos, São Paulo, Brazil, [4]Université Lumière Lyon 2, Pôle de Psychologie Sociale, Lyon, France, [5]University of São Paulo, São Paulo, Brazil

Background: Real-world experience with PrEP, including injectable long-acting cabotegravir (CAB-LA) option, is essential for guiding policy and practice. Understanding the decision-making process behind selection methods is crucial to improving uptake, retention, and effectiveness. We investigated choice patterns in PrEP modalities among sexually and gender-diverse adolescents and youth in northeastern Brazil.
Methods: Qualitative research nested in the ongoing PrEP15-19 Choices cohort, which offers participants both oral PrEP (event-driven or daily) and CAB-LA.
Between Sep-Dec/2024, we conducted 25 in-depth interviews with twelve participants using oral PrEP, and 13 using CAB-LA. Interviews covered housing, education, motivations, side effects, family relationships, PrEP choices and experiences. Thematic content analysis was conducted with NVivo-15.
Results: Participants were men who have sex with men (17), transgender women (8), and non-binary (1).Most participants were in school (76%, 19) and identified as Black or Brown(92%, 23). Of the 13 who chose CAB-LA, seven were aged 16–17, and six were aged 18–20.
In contrast, oral PrEP was preferred by 9 of 12 participants aged 18–19. Four distinct decision-making processes regarding PrEP modality were identified: 1-participants offered both modalities and opting for oral PrEP; 2- participants offered the same options and choosing CAB-LA; 3- participants who initially used oral PrEP but later transitioned to CAB-LA; and 4 - One participant, on oral PrEP since 2023. The narratives of group 2 highlighted family conflicts, including discriminatory cultural or religious practices, worsened by storing pills at home.
Participants valued CAB-LA's convenience, practicality, and ability to avoid daily pill use and the risk of forgetting doses. Switching from oral PrEP to CAB-LA also offered greater privacy and reduced family-related conflicts (group 3).
The main reasons for group 1 were needle aversion or concerns about side effects. Event-driven PrEP was often linked to scheduled or sporadic sexual activity.
Conclusions: The choice of PrEP modalities was affected by participants' previous experience with oral PrEP, ability to manage potential conflicts posing risk to privacy and confidentiality, and concerns about pain and side-effects. These findings underscore the need for health policies and interventions providing diverse PrEP options and tailoring to the specific needs and contexts of young people.

EP0872

Targeted identification and enrollment of high-risk adolescent girls and young women (AGYW) and association of HIV risk and program outcomes DREAMS Rwanda

E. Ndengo[1], C. Niyonsenga[2], A. Mukaneza[1], E. Niyonsaba[1], A. Nkusi[1], K. Plourde[3], N. Petrovic[3]
[1]United States Agency for International Development, Kigali, Rwanda, [2]PACT/ACHIEVE, Kigali, Rwanda, [3]United States Agency for International Development, Office of HIV/AIDS, Washington DC, United States

Background: Despite global HIV incidence declines, high infection rates among adolescent girls and young women (AGYW) persist. HIV prevalence among AGYW in Rwanda is 3.7% and young women aged 20-24 are five times more likely to be HIV-positive than their male peers. PEPFAR's DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe) program aims to reduce HIV rates among AGYW in high-burden settings. Rwanda is among the few countries that have achieved the UNAIDS 95-95-95 targets. As Rwanda approaches the UNAIDS 2030 target of ending the HIV epidemic, precision prevention programming for priority populations, e.g. AGYW, is essential to close gaps in new infections and achieve epidemic control.
Description: Since 2018, Rwanda has implemented DREAMS, reaching 163,236 AGYW with combination prevention programming across five districts. The Rwanda Data Tracking System (RDTS) tracks AGYW identification, eligibility assessment, enrollment in activities and services, and monitoring of service provision.
Enrollment is based on a variety of risk and vulnerability factors with targeted strategies to identify those at highest risk of HIV.
Lessons learned: A descriptive analysis of DREAMS program data from FY21 to FY24 provided insights into risk profiles of enrolled AGYW. Among 574 identified AGYW who tested positive upon entering the program, 53% were aged 20-24, 44% were 15-19, and 3% were 10-14. Of these, 61% had one risk factor/ vulnerability, 15% had two, 8% had three, and 12% had four to nine. Risks and vulnerabilities included inconsistent condom use (30%), sexual violence (23.5%), transactional or intergenerational sex (15.6%), school dropout/non-attendance (15.6%), alcohol use (12%), history of pregnancy (21%), and orphanhood (11%). USAID Rwanda is conducting further analysis to identify patterns related to HIV risk and program outcomes among AGYW.
Conclusions/Next steps: Findings underscore diverse levels of complex and overlapping HIV risk and vulnerability factors among AGYW enrolled in DREAMS and the need

for tailored interventions. Results can enhance combination HIV prevention strategies targeting AGYW, ensuring greater efficacy, impact, and sustainability. While findings are specific to Rwanda, other high-burden countries in the region may benefit from lessons learned in Rwanda.

EP0873

Leveraging A/B testing for scalable and cost-effective HIV prevention programs in Botswana

B. Motlhobogwa[1], C. Cullen[1], M. Matsheng[2], R. Madzudzo[2], N. Angrist[3]

[1]Youth Impact, Research, Gaborone, Botswana, [2]Youth Impact, Gaborone, Botswana, [3]University of Oxford, Oxford, United Kingdom

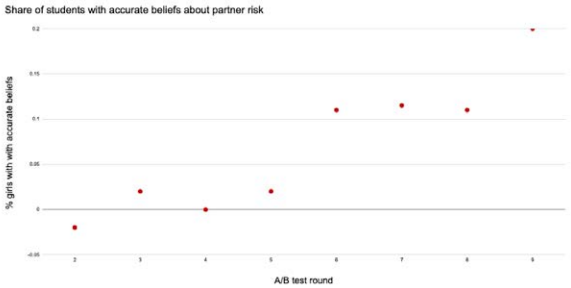
Background: Botswana has one of the world's highest HIV prevalence rates, with adolescent females being disproportionately affected. To address the challenge of reducing HIV risk while maintaining cost-effectiveness at scale, Youth Impact implements and studies a school-based Adolescent Sexual and Reproductive Health program for girls in Botswana. Using randomized A/B testing, the program refines intervention components, assesses scalability, and optimizes impact to improve adolescent girls' health outcomes.

Description: The program targets adolescent girls in junior secondary schools across Botswana, a key population at risk of HIV. It includes a proven 90-minute in-school session designed to inform girls about relative partner risk and safe dating strategies. Since 2016, Youth Impact has employed randomized A/B testing each school term to iteratively optimize the program's impact and cost-effectiveness. Key alternatives to the standard approach have been tested, including variations in group composition, curriculum messaging, and booster sessions. The program is delivered in collaboration with schools and local government stakeholders.

Lessons learned: A/B testing revealed effective and scalable strategies for program delivery, including:

- Mixed-sex groups of boys and girls, which proved as impactful as girls-only sessions while being more scalable.
- Simplified messaging, which enhanced impact at minimal additional cost.
- Cost-effective booster sessions, which significantly increased program effectiveness.

Over half of Youth Impact's A/B tests have resulted in more than a 20% improvement in program cost-effectiveness, marking a remarkable achievement.



Conclusions/Next steps: A/B testing is a valuable implementation science tool for scaling HIV prevention programs. It enables iterative refinement to support high-quality implementation at scale, adapt to new contexts, and improve cost-effectiveness. Youth Impact will expand the program to additional regions and countries and is actively supporting other organizations in using A/B testing to enhance their programs' scalability and cost-effectiveness. These findings underscore the importance of real-time evaluation and rapid, evidence-based decision-making in scaling impactful HIV prevention interventions.

EP0874

Peer-led tailored biosocial support and sexual health engages sexually active adolescents and young adults in rural South Africa: Thetha Nami (Lets' Talk) cluster RCT process evaluation

T. Zuma[1,2,3], J. Busang[1], M. Luthuli[1], S. Hlongwane[1], S. Nkwanyana[1], P. Khanyile[1], N. Chimbindi[1,2,3], J. Dreyer[1], C. Herbst[1], N. Okesola[1], L. Lebina[1], J. Seeley[1,4,3], A. Copas[2], K. Baisley[4], M. Shahmanesh[1,2,3]

[1]Africa Health Research Institute, Durban, South Africa, [2]University College London, London, United Kingdom, [3]University of KwaZulu-Natal, Durban, South Africa, [4]London School of Hygiene and Tropical Medicine, London, United Kingdom

Background: The Thetha Nami (Let's Talk) trial in rural KwaZulu-Natal, South Africa, uses peer-led social mobilization to engage adolescents and young people (AYP) aged 15-30 with decentralized sexual and reproductive health (SRH) services, including HIV care and prevention. Peer navigators assess health, social, and educational needs and facilitate referrals to mobile clinics. A mixed methods process evaluation, conducted from July 2023 to December 2024, assessed the intervention's implementation

Methods: The process evaluation, based on the RE-AIM framework, used quantitative and qualitative methods. Routine programmatic data were collected electronically to evaluate uptake, reach and dose. In-depth interviews (N=49 AYP, N=22 with implementation staff) field observations, and group discussions (n=4) provided insights into intervention fidelity and participants' experiences. Qualitative data were transcribed, translated from IsiZulu to English, and analysed thematically.

Results: The intervention was feasible. Peer navigators reached 17,241 (70% of all AYP), 8110 males (47%), 9131 (53%) females, for health promotion and needs assessments. Engagement increased intervention acceptability, improved SRH knowledge, and helped AYP recognize themselves as candidates for tailored HIV prevention, including PrEP. N=212 (1%) AYP declined peer support. Case-based management and follow-ups by peer navigators facilitated linkage to care. A total of 4039, 1696 males (42%), 2343 (58%) females, were referred for mobile clinic visits by peer navigators. N=3600 (89%) were unaware of their status and underwent point of care HIV testing with 139 (4%) newly diagnosed and starting ART. N=1823/3461 (53%)

were at risk of HIV acquisition and offered oral PrEP, of which 1083 (59%) initiated use, with the others not accepting PrEP. N=51 have taken up PEP 25 males (49%) and 26 (51%) females. N=5876 were screened for STIs, with 1060 (18%) treated; 932 received contraceptives. Interviews with AYP found that community stigma towards SRH service use for AYP persists.

Conclusions: Peer-led biosocial support and sexual health services effectively engage AYP at high HIV risk. However, stigma, challenges with daily pill regimens, and low risk perception limit uptake, particularly of PrEP. The high uptake of HIV and STI testing highlights the need for accessible SRH services, including long-acting PrEP, for AYP.

EP0875

Simplified and diversified Pre-Exposure Prophylaxis (PrEP) services for key populations in Tajikistan, 2024

F. Saydullaev[1], R. Bhatia[2], S. Sattorov[3], R. Kholnazarov[3]
[1]CDC in Tajikistan, DGHT, Dushanbe, Tajikistan, [2]CDC US, DGHT, Atlanta, United States, [3]Republican Aids Center of Tajikistan, Dushanbe, Tajikistan

Background: Alarmingly, new HIV acquisitions are on the rise in Central Asia including Tajikistan, where key populations (KP) are at disproportionate risk for HIV. In 2020, the national program introduced fully subsidized pre-exposure prophylaxis (PrEP) to be provided exclusively to people visiting public facilities in person. To increase access, the Republican AIDS Center (RAC) committed to simplify and diversify PrEP services aligned with 2022 WHO guidance.

Description: In late 2023 the RAC, with the United States Centers for Diseases Control and Prevention (CDC) support, convened the first national technical working group (TWG), comprised of healthcare workers, funders, community members, and other stakeholders, to update the 2020 PrEP guidelines. The TWG worked in an iterative process to first identify gaps in PrEP eligibility, broadening from men who have sex with men alone to all born male and, for the first time, anyone requesting PrEP. Policies requiring in-person visits to public facilities and HIV testing were revised to include fully remote tele-PrEP, HIV self-tests, PrEP provision by any medical facility for initiation and continuation. The TWG developed a phased implementation plan, including coordinated responsibilities and timelines for demand creation, training, and monitoring and evaluation.

Lessons learned: Updated guidelines were launched in November 2024, followed by jointly training the initial cadre of clinical and community healthcare workers. Within a day of training, the first client in the country started tele-PrEP. Lessons learned included having a diverse, cohesive TWG with RAC leadership to ensure contextualization of global best practices to remove potential barriers and acceptability of guidelines at all levels; a community-engaged approach; a realistic, shared implementation timeline; and sustainability of the new policies. Co-training clinical and community staff helped build referral systems and collaborations important for demedicalized service delivery.

Conclusions/Next steps: To our knowledge, Tajikistan's 2024 PrEP guidelines are the most permissive in Central Asia, with implementation ongoing. Allowing for broad PrEP eligibility and fully remote service has the potential to overcome common barriers, including stigma and transportation, to increase PrEP access and curb the rise in new HIV acquisitions.

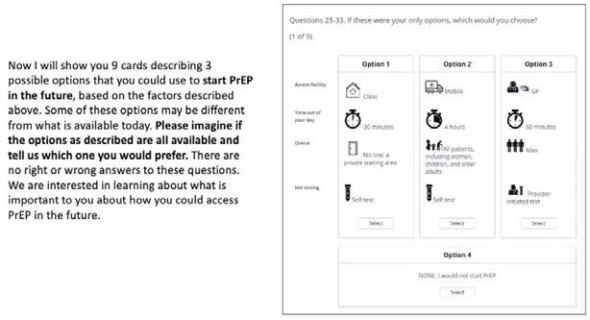
EP0876

Preferences for PrEP initiation services among men in rural South Africa: a discrete choice experiment

H.H. Leslie[1,2], M. Griffith[3], D. Mabetha[2,4], K. Kahn[2,4], S.A. Lippman[1,2], E.T. Montgomery[5], S. Mullick[6]
[1]University of California San Francisco, Division of Prevention Science, Department of Medicine, San Francisco, United States, [2]University of the Witwatersrand, MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), Johannesburg, South Africa, [3]University of California San Francisco, Institute for Health & Aging, San Francisco, United States, [4]University of the Witwatersrand, School of Public Health, Faculty of Health Sciences, Johannesburg, South Africa, [5]RTI International, Berkeley, United States, [6]University of the Witwatersrand, Wits RHI, Johannesburg, South Africa

Background: In rural areas of Mpumalanga Province, HIV prevalence exceeds 9% for men by age 24, yet HIV testing, awareness of currently available and investigational pre-exposure prophylaxis (PrEP) methods and use of oral PrEP are low. Men in this setting use clinics infrequently. Understanding men's preferences for PrEP methods and service delivery can inform implementation.

Methods: We conducted a cross-sectional survey with a population-based sample of men aged 18 - 34 in rural Bushbuckridge, South Africa; 313 of 324 eligible individuals (96.6%) consented and 300 reported negative or unknown HIV status. We used latent class analysis to analyze a discrete choice experiment assessing preferences for health service attributes to initiate current or future PrEP methods (Figure).



Results: We identified 6 classes of PrEP initiation preferences, with the largest (27%) preferring not to initiate PrEP under the choices provided (opt out). Facility type and time required were the most important attributes for all remaining classes. Three classes expressed preference for government facilities: 24% who prioritized shorter time required and favored clinics as well as mobile facilities, 7% with similar preferences but more frequent opt

outs, and 22% who prioritized facility type with a strong preference for clinics. 13% of respondents prioritized time required and favored clinics, mobile facilities, or pharmacies, and 7% preferred private doctors and pharmacies as well as shorter time required. Two thirds of respondents reported multiple sexual partners in the past 12 months and 60% had heard of PrEP; proportions did not differ across classes.

Conclusions: Men aged 18 to 34 in a setting of high HIV exposure indicated varying preferences for health services for PrEP initiation. This evidence supports the role of public facilities along with differentiated delivery models to extend PrEP access to young men in high prevalence rural settings.

EP0877

Potential of long-acting pre-exposure prophylaxis (PrEP) to increase PrEP uptake amongst key populations in Cameroon

I.I. Nkaanah Fomefret[1,2], A. Boupda Kuate[3], S. Mabouna[3], C. Amah[1], L. Nguemo[1], D. Guebiapsi[1], K. Ekude[1], R.A. Ajeh[2]
[1]Integrated Research Education and Support group, Yaounde, Cameroon, [2]Ministry of Public Health, Yaounde, Cameroon, [3]Care and Health Program, Yaounde, Cameroon

Background: HIV prevalence continues to be disproportionately higher amongst key populations (KPs) in Cameroon, with prevalences ranging from 17 to 30%. While oral pre-exposure prophylaxis (PrEP) has been implemented for KPs since 2019, low uptake and high discontinuation rates have been persistent.

This study assessed the potential of long-acting injectable (LAI) antiretrovirals (ARV) to improve PrEP uptake and retention amongst KPs in Cameroon.

Methods: This was a cross-sectional study implemented by the Integrated Research Education and Support Group, and the Care and Health Program in community-based organizations (CBOs) across five regions in Cameroon from July to October 2023, using an exhaustive consecutive sampling technique. Pre- tested, structured tablet-based questionnaires were administered to female sex workers (FSWs) and men who have sex with men (MSM), injectable drug users (IDU) and transgender individuals(TG) by trained research assistants based in the CBOs. Data analysis was done using SPSS.

Results: We recruited 1140 participants, comprising FSWs (75.2%), MSM (23.3%), IDU (1.2%) and TG (O.3%). Overall, 55.9% were on oral PrEP; with 50.3% FSWs and 76.3% MSM on PrEP. Discontinuation from PrEP was accounted mainly for by forgetfulness (51.1%), being displaced (33.3%), and daily pill burden (26.6%).

Among PrEP eligible participants who were not on oral PrEP (503), 82.4% indicated willingness to enroll in injectable PrEP option if available.Furthermore, 62.3% of those on oral PrEP preferred to switch to LAI PrEP and 60.6% of them reported it LAI would improve their adherence.

To showcase strong interest in LAI PrEP, about 40% of participants indicated willingness to co-pay for LAI PrEP if made available, irrespective of free oral PrEP.

Conclusions: This study shows a high potential for LAI PrEP to improve PrEP program uptake and adherence amongst KPs, especially amongst those eligible but not on oral PrEP. HIV program managers in Cameroon and decision makers should consider adopting LAI PrEP in KPs to avert the disproportionately higher HIV incidence in this KPs and ultimate HIV epidemic control in Cameroon by 2030.

EP0878

The doors are open but they are not here! ongoing barriers to pre-exposure prophylaxis (PrEP) among Black and Latinx sexual and gender minoritized (BLSGM) individuals in Long Beach, California, USA

L. D'Anna[1], J. Wood[1], J. Owens[1]
[1]Charles R. Drew University of Medicine and Science, College of Medicine, Los Angeles, United States

Background: Long Beach ranks third in California health jurisdictions with the highest HIV case rates. Despite three PrEP Centers of Excellence and robust HIV prevention efforts, BLSGM individuals are overrepresented among new HIV diagnoses and have low PrEP engagement. Using a community-engaged equity approach and implementation science (IS) framework, we sought to identify persistent barriers to PrEP uptake.

Methods: Study aims and instruments were co-created with community-driven PrEP and transgender wellness workgroups (including individuals living with HIV). Survey items were guided by PRISM domains - recipient perspectives/characteristics (RP/C), implementation infrastructure (II), and external environment (EE), and included PrEP use, PrEP intent, perceived HIV risk, and PrEP barriers. HIV-negative BLSGM individuals, ages 18-35, were engaged through referrals and street intercept from 12/1/23 to 08/15/24.

Forty-three barriers were dichotomized and prospectively coded as Healthcare Access (8 variables), and PrEP Appropriateness (7), Knowledge (3), Side Effects (10), and Stigma (15). Researchers used SPSS 27 Automated Linear Model procedure to identify variables with the greatest predictive power for positive PrEP intent. The Perceived HIV Risk Scale score was included in the final model.

Results: Among 262 respondents, 40.8% were Black/African American and 59.2% were Latinx. The mean age was 26.79 years, and 34.8% reported a gender identity other than cisgender, and 75.9% reported a sexual identity other than heterosexual.

Most (89.3%) never used and 10.7% discontinued PrEP. Low intention to use PrEP ("Unlikely/Very Unlikely") was expressed by 49.8%, while 28.4% said they were "neutral," and 21.8% indicated they were "likely/very likely" to initiate PrEP.

Barriers Predicting PrEP Intent (Item type; IS domain)	n	t-test	p
No close friends are taking PrEP (Stigma; RP/C)	56	t(170) = -3.88	p < 0.001
Discomfort talking to PrEP Navigator (Stigma; RP/C)	65	t(135.4*) = -4.13	p < 0.001
Lack of health insurance (Healthcare Access; II & EE)	14	t(241) = 2.85	p = 0.005
Belief hard to tell sex partner(s) about PrEP (Stigma; RP/C)	43	t(246) = -2.77	p = 0.006
Belief friends would not be supportive of PrEP (Stigma; RP/C)	40	t(64.1*) = -3.97	p < 0.001

** Levene's test showed that the variances were not equal.*

Conclusions: The relevance of PrEP stigma-related variables in predicting PrEP intention highlights the importance of recipient/community-level interventions focusing on stigma reduction and social support for PrEP uptake. Findings also suggest that those who may have higher PrEP intentions are unable to follow through due to perceived implementation and external structural barriers. Improved implementation strategies related to PrEP accessibility and cost are still needed.

EP0879

Inequalities in access to and retention of HIV pre-exposure prophylaxis: a comparative analysis of public and private services in Brazil (2018-2023)

F.Á. Paula de França[1], B.B. Kamiensky[1], T.C. Morelli[1], M.C. Madeira de Moura[1], J.B. Alonso Neto[1]
[1]Brazilian Ministry of Health, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis, and Sexually Transmitted Infections, Brasília, Brazil

Background: In 2021, the Brazilian Ministry of Health began allowing private doctors to prescribe PrEP as part of a strategy to increase its use. This study aimed to analyze the sociodemographic profile and linkage to PrEP units in Brazil, comparing public and private healthcare facilities to identify usage patterns and factors associated with discontinuation.
Methods: A cross-sectional study was carried out using data from the Medicines Logistics Control System (Siclom), Ministry of Health, covering the period from 2018 to 2023 and including users who received at least one oral PrEP dispensation in that period. Users who were not dispensed PrEP at a public pharmacy in 2023 were considered to be discontinued. The variables analyzed included sociodemographic characteristics (age group, race/color, schooling, gender identity) and type of service (public/private).
The analyses used Pearson's chi-square test to assess associations between the variables, considering statistical significance for $p<0.05$.
Results: Between 2018 and 2023, 77,445 users were taking PrEP in Brazil, with 92.2% in the public sector and 7.8% in the private sector. Gay men and other men who have sex with men predominated, being more frequent in the private sector (93.4% versus 82.9%; $p<0.001$).
Users in the private sector had a higher level of education (90.3% with 12 years or more versus 69.1%; $p<0.001$) and a higher proportion of whites (70.6% versus 53.8%; $p<0.001$). The chance of staying on PrEP when follow-up was carried out in the private sector was 1.4 times higher. The public service mostly served individuals with greater presumed social vulnerability, with 45.7% and 30.9% of black people and less than 12 years of schooling ($p<0.001$).
Conclusions: The analysis revealed that the public service offers PrEP more equitably, with a higher proportion of black people and lower levels of education, while the private sector concentrates users with higher levels of education and presumed higher income, as well as a lower discontinuation rate.
These findings reinforce the importance of strategies in the public sector to promote greater retention and equity in access, strengthening the universal and inclusive role of the Brazil's public health (SUS) system as a public policy.

EP0880

Navigating choices: anticipated drawbacks to PrEP modalities among sexual and gender diverse adolescents in Brazil

D. Zeballos[1], F. Soares[1], L. Magno[2,1], B. Oliveira Leite[1], D. Greco[3], A. Grangeiro[4], I. Dourado[1], The PrEP15-19 choices study group
[1]Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil, [2]Universidade do Estado da Bahia, Departamento de Ciências da Vida, Salvador, Brazil, [3]Universidade Federal de Minas Gerais, Belo Horizonte, Brazil, [4]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil

Background: Long-acting injectable PrEP (LAI-PrEP) addresses challenges associated with daily adherence. However, there is limited research on factors influencing adolescents' preferences for different PrEP modalities.
We aimed to analyze anticipated drawbacks to choosing (LAI-PrEP) and event-driven PrEP (ED-PrEP) among sexual and gender diverse adolescents in Brazil.
Methods: The PrEP15-19 Choice´s implementation study offered oral PrEP (daily and ED-PrEP) and LAI-PrEP using cabotegravir as a choice to cisgender men who have sex with men (MSM), transgender and non-binary (NB) people aged 15 to 19 in three Brazilian cities.
Adolescents enrolled in PrEP between October 2022 and January 2025 were surveyed about anticipated drawbacks to choose LAI-PrEP and ED-PrEP before selecting their preferred modality.
Descriptive statistics identified the most cited drawbacks, and associations with participants' characteristics were analyzed using Pearson's chi-square or Fisher's exact test.
Results: We included 344 adolescents. The most frequently anticipated drawbacks for LAI-PrEP were concerns about pain (49.4%), potential side effects (49.1%), and the need to take oral PrEP during the "tail period" after discontinuing LAI-PrEP (39.5%).
Attending the clinic every two months for LAI-PrEP was a drawback for adolescents with higher risk perception ($p=0.002$) and prior PrEP use ($p=0.04$). Discussing LAI-PrEP with a partner was a concern for transgender women ($p=0.025$). Adolescents with a partner using PrEP have fewer concerns about discussing LAI-PrEP with their partner ($p=0.03$).
For ED-PrEP, the primary drawbacks were the need to anticipate sexual activity (66.3%) and remember the correct dosing regimen (57.3%). Black adolescents ($p=0.01$), those with lower schooling ($p=0.02$) and PrEP-naïve individuals ($p=0.008$) expressed difficulty remembering the correct use of ED-PrEP. PrEP-naïve adolescents were concerned about side effects for ED-PrEP ($p=0.007$).
Adolescents in non-family-based housing ($p=0.006$) and those who are in stable relationships ($p=0.001$) were worried about the visibility of taking the pill.

Conclusions: Anticipated drawbacks can play a critical role in adolescents' decisions to initiate PrEP. Addressing these concerns is vital to reduce barriers and tailor PrEP interventions to the diverse needs of adolescent subgroups.

EP0881

Optimizing access to sexual and reproductive health commodities through vending machines: a demand creation approach for adolescents and young people in South African TVET campuses

T. Finger[1], N. Tshuma[2], T.M. Ndhlovu[2]
[1]Higher Health, Pretoria, South Africa, [2]Best Health Solutions, Public Health, Johannesburg, South Africa

Background: Higher Health, under the Global Fund Adolescents and Young People (AYP) Programme (2022-2025), aims to enhance access to HIV prevention and sexual and reproductive health (SRH) services for AYP aged 15-24 within TVET campuses across 13 sub-districts. The initiative seeks to address barriers to SRH commodity access by deploying 37 vending machines, offering a core package of essential services to improve uptake and adherence to SRH interventions.
Description: The AYP Programme targets in and out-of-school AYP, with engagement of adolescent boys and young men. The vending machine initiative provides free SRH commodities, including condoms, lubricants, pregnancy tests, and sanitary towels, to enrolled AYP through a unique six-digit PIN system. AYP access services via an enrolment process involving Health and Wellness Counsellors (HWCs) and a centralized monitoring platform (Softwin 3).
The demand creation strategy incorporates campus-based awareness campaigns, peer education, and risk assessment to enhance uptake and promote continued engagement with SRH services.
Lessons learned: Quantitative evaluation conducted after two implementation quarters revealed that; across 37 TVET campuses, total of 18,750 AYP accessed the vending machines, with an average of 507 AYP per campus. Male condom uptake accounted for 56% of total dispensed commodities, followed by sanitary towels (22%), lubricants (10%), and pregnancy tests (7%).
Disaggregated data indicated significant uptake in urban campuses (68% of total usage) compared to rural settings (32%), highlighting differential demand creation effectiveness. PIN-linked usage data showed 73% of AYP with high-risk profiles accessed multiple commodities monthly, suggesting effective targeting. Average of 4.5 refills per campus were required quarterly, with higher replenishment rates for male condoms and sanitary towels, indicating critical demand trends. A post-usage survey among 4,500 AYP reported an 89% satisfaction rate, with key drivers including privacy, accessibility, and variety of commodities.
Conclusions/Next steps: The vending machine initiative demonstrated significant potential in improving SRH commodity accessibility for AYP, with positive uptake and user satisfaction metrics. Efforts will focus on optimizing stock replenishment, expanding vending machine placement to after-hours accessible locations, and integrating additional commodities such as HIV self-testing kits to meet evolving AYP needs. Strengthened demand creation strategies, particularly in rural campuses, will be prioritized to ensure equitable service reach.

EP0882

Interventions created by clients and healthcare providers to support persistence on long-acting cabotegravir pre-exposure prophylaxis in Malawi: a human-centered design approach

F. Chauwa[1], D. Hoege[2], A. Bula[3], K. Murombedzi[4], D. Sinchaya[4], M. Yobe[5], C. Banda[6], F. Kamanga[3], L. Msumba[3], L. Seyama[1], R. Chilongosi[5], J. Odek[2], G. Chisamba[6], J. Lobeni[7], J. Njobvuyalema[8], S. Dadabhai[9], W. Ozituosauka[10], M. Hosseinipour[11], S. Schwartz[12], C. Holmes[2], L. Beres[12], Chauwa and Hoege contributed equally
[1]The Johns Hopkins Research Project (JHP) in Malawi, Blantyre, Malawi, [2]Georgetown University, Washington, United States, [3]UNC Project Malawi, Lilongwe, Malawi, [4]Population Services International (PSI), Lilongwe, Malawi, [5]Family Health Services, Lilongwe, Malawi, [6]Blantyre District Health Office, Blantyre, Malawi, [7]District Health Office, Lilongwe, Malawi, [8]National AIDS Commission, Lilongwe, Malawi, [9]Johns Hopkins Bloomberg School of Public Health, Blantyre, Malawi, [10]Ministry of Health, Lilongwe, Malawi, [11]University of North Carolina at Chapel Hill School of Medicine, Lilongwe, Malawi, [12]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States

Background: The public health roll-out of long-acting injectable Cabotegravir pre-exposure prophylaxis (CAB-LA) in Malawi began in March 2024. Community collaborations to develop interventions to sustain use and limit drug resistance are essential for injectable HIV prevention success.
Methods: Clients, providers, government, and researchers collaborated to co-design CAB-LA persistence support interventions in Malawi using rigorous, iterative, human-centered design research. From March-July 2024, we gathered and synthesized extant PrEP persistence evidence and insights from Ministry of Health officials, literature, and CAB-LA providers via group discussions and prioritization exercises. We also drew on Malawi's pre-product formative research data.
Key knowledge gaps were transformed into guiding questions for co-creation workshops. A 4-day workshop was held in August 2024 with oral and CAB-LA clients (n=17) and CAB-LA providers (n=12). Through participant-led exercises such as journey maps and rapid analysis, this workshop identified and prioritized intervention components.
In September 2024, during a 2-day follow-up workshop, clients (n=7 discontinued CAB-LA, n=6 discontinued oral PrEP, n=2 active PrEP users) and providers (n=10) created intervention prototypes.
Results: Discontinuation trajectories identified during the workshop included stopping CAB-LA due to:

1. Stigma concerns,
2. Ending a relationship where HIV acquisition was a possibility,
3. Poor provider-client interactions,
4. Undesirable side effects, and
5. Hours of CAB-LA injection availability conflicting with client workhours/livelihoods.

HCD participants also emphasized that confidentiality is critical for clients in any HIV prevention interaction, peers are highly influential in health decision-making, and feasible interventions cannot add burden to healthcare workers' heavy workload.

The final, designed interventions and mechanisms of action included:

1. Trustworthy, facility-based expert client offering information and social-emotional client support while promoting PrEP visibility and acceptance;
2. Improving provider-client empathy, communication, and warm reception through client feedback, recognition of health worker achievement and provider training;
3. Early clinic opening to enable PrEP services outside of standard hours.

Conclusions: Clients and providers created individual, inter-personal, and structural interventions operating across multiple mechanisms to support sustained use of CAB-LA.

Other injectable HIV prevention programs should consider the relevance of similar mechanisms and levels of action. The created interventions will be tested in a cluster randomized trial in early 2025.

EP0883

Challenges and lessons learned in transitioning the voluntary medical male circumcision (VMMC) program from PEPFAR to MoH in Mozambique

F. Mudender[1], S. Munguambe[1], A. Maiela[1], M. McDowell[2], L. Chwastiak[2], J. Lane[2], E. Nacarapa[1]

[1]I-TECH Mozambique "International Training & Education Center for Health", Maputo, Mozambique, [2]University of Washington, Department of Global Health, Seattle, United States

Background: In 2021 Mozambican MoH began implementing plan to progressively take over operations and management of VMMC sites with support from International Training and Education Center for Health (I-TECH), Health Resources and Services Administration (HRSA) funded PEPFAR partner. We aim to describe this process and highlight best practices and challenges for effective and sustainable transition of VMMC services from PEPFAR-supported to MoH.

Description: Six sites were identified in four provinces. I-TECH supported MoH through coordination across stakeholders, creation of metrics to monitor the transition and technical assistance (TA) to troubleshoot unforeseen challenges, both clinical and non-clinical. This support aided MoH capabilities to maintain high quality VMMC services including monitoring of outcomes, management of adverse events, and demand generation.

To map best practices and ensure sustainability of the transition process, we assessed activities against six WHO Health System Building Blocks.

Lessons learned: MoH led planning and consultations at multiple system levels, including creating taskforce for specific assignments, led to rapid absorption and integration of VMMC services into health facilities' standard operations, including supply chain and allocation of human resources. Co-development of Transition Guide for VMMC Services with MoH will standardize the procedures for transitioning operations.

Sites allocated clinicians (circumcizers) but not counsellors and activists, who play critical roles in client follow-up and demand creation. Not hiring these staff led to decrease in procedures after transition.

Transitions highlighted the need for VMMC clinicians to receive initial on-spot training and mentoring. Upon providing this support, service quality assessments showed that sites had maintained service quality equal to observed in non-transitioned sites and in pre-transition period. Low service uptake followed by infrastructure maintenance and hiring of non-state cadre personnel constituted challenge for services sustainability. Lack of budget for demand creation activities resulted in I-TECH's involvement in supporting community mobilization activities, providing transportation voucher for outreach activities, non-coercive incentives to clients for adequate hygiene practices and hiring counsellors.

Conclusions/Next steps: This experience shows the feasibility of transitioning VMMC services to MOH in low resource settings and importance of closely monitoring the transition to identify programmatic activities that may need higher levels of support during transition.

Implementation research to scale up treatment

EP0884

Scale of differentiated service delivery implementation in HIV care facilities in low- and middle-income countries: a global facility survey

N.V. Fernandez Villalobos[1], F. Helfenstein[2], V. Khol[3], C. Twizere[4], M. Secco[5], B. Castelnuovo[6], J. Huwa[7], T. Tiendredbeogo[8], C.W. Wester[9], S.M. Fong[10], G. Murenzi[11], Y. Background: In 2016, the World Health Organization recommended differentiated service delivery (DSD) as a client-centered approach to simplify HIV care in frequency and intensity, thus reducing the clinic visit burden on individuals and HIV programs. We describe the scale of DSD implementation among HIV facilities in low- and middle-income countries (LMICs).

Methods: We analysed facility-level survey data from HIV care facilities located in LMICs that participated in the International epidemiology Databases to Evaluate AIDS (IeDEA) consortium in 2019. We used descriptive statistics to summarize availability of any DSD, multi-month dispensing (MMD), and DSD for HIV treatment models.

Results: We included 175 facilities in the Asia-Pacific (n=30), Latin America (n=8), Central Africa (n=21), East Africa (n=74), Southern Africa (n=28), and West Africa (n=14).

Overall, 133 facilities (76%) reported implementing DSD, ranging from 26% in the Asia-Pacific to 93% in East Africa. Of these, 91% offered DSD for HIV treatment, 61% for HIV testing, and 59% for antiretroviral therapy (ART) initiation. The most common duration of ART refills was 3-month dispensing, (70%), followed by monthly (14%) and 6-month dispensing (10%). Facility-based individual models were the most frequently available DSD for HIV treatment model (82%), followed by client-managed group models (60%) *(Figure)*.

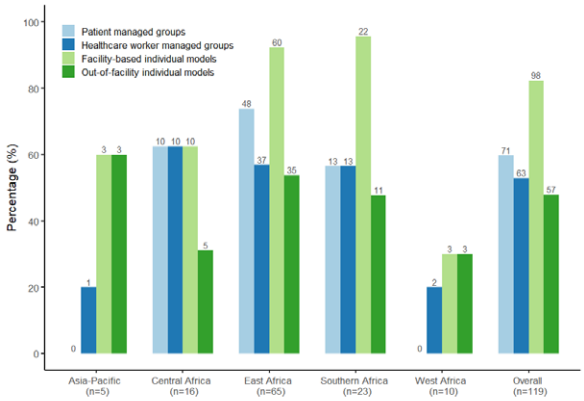

*Figure. Availability of DSD for HIV treatment models in IeDEA-participating facilities (n=119) by region in 2019. *Footnote: None of the participating facilities in Latin America reported providing DSD for HIV treatment.*

Conclusions: In 2019, DSD was available in most IeDEA-participating HIV care facilities but was not evenly implemented across regions and HIV services. Most facilities offered facility-based DSD for HIV treatment models and 3-month dispensing for clinically stable clients. Efforts to expand DSD in HIV testing and ART initiation and to offer longer MMD can improve long-term retention in care of people with HIV in LMICs, while further alleviating the operational burden on healthcare services.

EP0885

Innovative HIV care in Zambia: implementation research on telemedicine as a key DSD strategy for supporting people living with HIV (PLHIV) and epidemic control by 2030

B. Kaonga[1], J. Daka[1], N. Toppin Dera[2], D. Mack[2]
[1]Morehouse School of Medicine Zambia Limited, Telemedicine, Lusaka, Zambia, [2]Morehouse School of Medicine, National Center for Primary Care-Telemedicine, Atlanta, United States

Background: Zambia, with 1,348,041 People Living with HIV as of 2022, has made progress toward UNAIDS 95-95-95 targets, achieving 88.7% diagnosis, 98.0% treatment, and 96.3% viral suppression among People Living with HIV(PLHIV) aged 15-59. However, critical gaps remain among adolescents and young people (AYP) aged 15-24, where diagnosis, treatment, and viral suppression rates are considerably lower at 75%, 74%, and 70%, respectively. These disparities and challenges in traditional healthcare models necessitate innovative solutions like telemedicine to enhance access and support Zambia's 2030 epidemic control goals.

Description: The Morehouse School of Medicine's Telemedicine Initiative in Zambia (June 2021–July 2024) established a hub-and-spoke network connecting major healthcare centers with local clinics via digital platforms. This model enabled real-time video consultations, reducing healthcare client travel distance and improving rural access to HIV care. Supporting 11,244 PLHIV, the program utilized the mobile health platforms to conduct video consultations by clinicians utilizing the national Electronic Health Record system, and Smartcare.

In collaboration with Zambia's Ministry of Health, NGOs, and tech companies, the project emphasized healthcare provider training, community engagement, and secure data management. Key outcomes included a 82% improvement in ART adherence, 82% achieving viral suppression, a 90% increase in care retention, a 95% rise in Healthcare Client engagement, 98% data accuracy, and a 80% improvement in early diagnosis, which refers to the timely identification of virally unsuppressed PLHIV through telemedicine.

Lessons learned: The initiative highlighted the importance of robust infrastructure, comprehensive provider training, community engagement to build trust, and phased implementation for smooth integration.

Conclusions/Next steps: The telemedicine initiative demonstrates how digital health solutions can bridge HIV care gaps in underserved areas, directly supporting Zambia's 2030 HIV goals and UNAIDS targets.

It underscores the need for integrating telemedicine into national strategies, providing a replicable model for other regions and sectors. The program's success emphasizes the importance of sustainability strategies, digital inclusion, and scaling telemedicine to reduce global healthcare inequities.

EP0886

One-year retention and viral suppression among people living with HIV accessing care through Community Retail Pharmacy Drug Distribution Point model at a district hospital in Uganda

P. Lwevola[1], R. Katwesigye[2], D. Kimuli[3], H.A. Walusaga[1], I. Twinomujuni[1], J. Nangendo[4], I. Ddumba[5], F. Ntuuyo[5], S. Kyobutungi[5], S. Kawuma[1], M. Arinaitwe[1], F.C. Semitala[6]
[1]Makerere University Joint AIDS Program, Technical services, Jinja, Uganda, [2]Makerere University Joint AIDS Program, Jinja, Uganda, [3]United States Agency for International Development Strategic Information Technical Support Activity, Monitoring and Evaluation, Jinja, Uganda, [4]Makerere University, College of Health Sciences, Implementation Sciences Research, Kampala, Uganda, [5]United States Agency for International Development, US Mission Compound - South Wing, Technical services, Kampala, Uganda, [6]School of Medicine, College of Health Sciences, Makerere University, Kampala, Uganda, Internal Medicine,, Kampala, Uganda

Background: Uganda's HIV prevalence has declined from 18% in the 1982 to 5.5% in 2022, with 1,290,000 persons living with HIV (PLHIV) on Antiretroviral treatment (ART). The increasing number of PLHIV in care has overwhelmed the national health system, with overcrowding, long waiting times, missed appointments, and suboptimal retention. The Uganda Ministry of Health (MoH) introduced the Community Retail Pharmacy Drug Distribution Points (CRPDDP), as one of the differentiated service delivery models to decongest health facilities, improve efficiency, convenience and client centered care while maintaining service quality.

This study evaluated retention and viral load suppression at one year, and associated factors among PLHIV enrolled on the CRPDDP model in a Ugandan rural district hospital.

Methods: This cross-sectional study was conducted at Iganga District Hospital, where the CRPDDP model was piloted from October 2021. Using a census approach, data from 360 PLHIV enrolled in the CRPDDP model for at least one year ago were analyzed. Retention and viral load before and after one year of enrollment, and associated factors were assessed using descriptive statistics and regression analysis.

Results: The mean age of the participants was 43.51 (±9.77) years, most participants were female (62.22%) and married (60.63%). The retention of PLHIV in the model was 94.72% (95% CI: 91.89–96.79). Nineteen (5.2%) PLHIV had dropped out of the model at the time of the data analysis: one lost from care, two relocated, and 16 returned to facility-based care. The mean viral load count before enrollment was 63.20 copies/mL (95% CI: 56.33–70.09) and 96.33 copies/mL (95% CI: 43.31–149.36) after enrollment, but this increase was not statistically significant (p=0.2228). Participants on the second-line ART regimen were less likely to be retained compared to those on the first-line regimen (aRR = 0.63, 95% CI: 0.41-0.95, p=0.028).

Conclusions: The CRPDDP model sustained high retention and effective viral load suppression at one year among PLHIV at a rural hospital, highlighting its potential as a

viable alternative to traditional facility-based ART distribution. However, PLHIV on second-line ART regimens were less likely to be retained, suggesting a need for tailored interventions for this subgroup.

EP0887

Enhancing viral load suppression and disclosure rates through multidisciplinary case conferences in Eastern Province, Zambia: a retrospective study

W. Mutambo[1], F. Kevile[1], S. Mainza[1], D. Phiri[1], L. Nyau[1], M. Ng'ambi[1]
[1]Eastern Provincial Health Office, Ministry of Health, Chipata, Zambia

Background: Despite antiretroviral therapy (ART) advancements, viral load suppression and HIV disclosure rates remained suboptimal, particularly among paediatric and adolescent populations. Multidisciplinary case conferences (MDCCs) offer a collaborative approach to addressing these challenges. Through the Sungani Bana Initiative, Multi-disciplinary case conferences are offered to all children with a High Viral load and/or identified as having Poor adherence to ART. The initiative is aimed at ensuring continuity in Care and improved health amongst children and adolescents living with HIV (CALHIV) through case management driven support toward better treatment outcomes.
This retrospective study evaluated the effectiveness of Multi-Disciplinary Case Conferences in improving viral load suppression and disclosure rates among HIV-positive individuals aged between 1-19 years in Eastern province that were enrolled in Sungani Bana Initiative.
Methods: Case conferences, led by Case managers at the health facility in collaboration with Caseworkers, Guardians and key stakeholders in the child life were conducted over a duration of time, usually 3-4 months for those with High Viral load and up to 6 months for Disclosure and Adherence challenges. A total of 98 children were enrolled in the Case conferencing package under the initiative. Training for 112 Healthcare workers in Age-Appropriate Disclosure and Adherence facilitation methodologies from across the Sungani Bana Implementation sites was also conducted in addition to Bi annual trainings of Case managers and Caseworkers in Case management was conducted.
Results: 1. Viral Load Suppression: Increased from 89% pre-implementation to 96% at 12 months, 97% at 24 months and 98% at 36 months post implementation.
2. Disclosure Rates: Improved from 40% to 85% at 36months. With 100% Disclosure rates for those graduating out of the initiative by age.
3. Correlates of Success: Stronger family support, improved adherence demonstrated by fewer missed appointments, and enhanced healthcare provider communication.
Conclusions: MDCCs significantly improve viral load suppression and disclosure rates among CALHIV. This multidisciplinary approach enhances patient outcomes, fosters supportive environments, and informs evidence-based interventions.
This study recommends the integration of MDCCs into HIV care protocols, enhanced healthcare provider training on communication and family-centred care and strengthening community support systems for CALHIV.

EP0888

Assessing the organizational readiness in using unstructured supplementary service data (USSD) to support treatment outcomes for adolescents living with HIV transitioning to adult care at Umodzi Family ART Clinic

W. Masambuka[1], L. Nyondo Mipando[1]
[1]Kamuzu University of Health Sciences, Global and Public Health, Blantyre, Malawi

Background: Adolescents living with HIV (ALHIV) encounter significant challenges transitioning to adult care, which can adversely affect their retention, drug adherence, and viral load suppression. Evidence suggests that mobile health interventions, particularly those utilizing Unstructured Supplementary Service Data (USSD), can enhance HIV knowledge and improve treatment outcomes. In Malawi, the rise in mobile phone penetration has led to the adoption of several USSD applications in healthcare. However, there are currently no USSD interventions tailored specifically for ALHIV. A proposed USSD application aimed at enhancing treatment outcomes for this population is being developed.
This study therefore aimed to assess the organizational readiness of the Umodzi Family ART Clinic to implement such a platform
Methods: This qualitative exploratory study was conducted between November 2023 and March 2024 at the Umodzi Family Clinic in Blantyre, Malawi, focusing on healthcare workers and ALHIV transitioning to adult care. We conducted nine in-depth interviews with healthcare professionals and facilitated three focus group discussions (FGDs) involving thirty-two ALHIV. All interviews and FGDs were recorded, transcribed verbatim, and analyzed using NVivo 14 software, guided by the theory of organizational readiness to identify key themes.
Results: Our findings indicate a strong willingness among ALHIV and healthcare workers to use the application to improve treatment outcomes during the transition to adult care. Key features like access to key treatment information and reminders were recognized as vital for enhancing adherence, retention, and viral suppression. The presence of digital platforms at the facility, widespread mobile access among ALHIV, and the facility's prior experience with digital health initiatives were major facilitators for the App's success.
Nevertheless. enhancements in privacy, security, interoperability, and overall app design were highlighted as critical features for successful app adoption.
Conclusions: The results indicate a strong willingness to adopt the suggested application to improve treatment results. Our results underscore essential pillars of organizational readiness that are vital in designing and implementing mHealth applications. The study's results are critical for developing and implementing USSD applica-

tions to support treatment outcomes for ALHIV transitioning to adult care. Nevertheless, design, privacy, and interoperability remain fundamental in successfully developing and deploying mHealth applications.

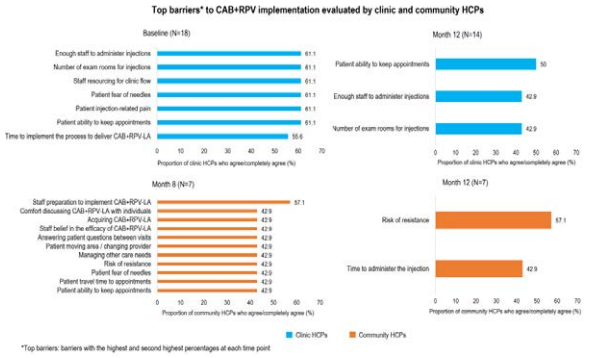
EP0889

Perspectives of healthcare providers on long-acting injectable cabotegravir and rilpivirine delivery in clinic and community settings in the UK: longitudinal survey findings from the ILANA study

C. Orkin[1,2], R. Hayes[3], J. Haviland[4], Y.L. Wong[4], N. Halim[1], B. Kasadha[5], M. Devonald[1], S. Paparini[3], K. Ring[1,2], J. Fox[6,7], R. Byrne[8], A. Clarke[9], E. Clarke[10], T.J. Barber[11,12], V. Apea[2,3], ILANA Study Group (Sadna Ullah, James Hand, Chikondi Mwendera)

[1]Queen Mary University of London, SHARE Collaborative, Blizard Institute, London, United Kingdom, [2]Barts Health NHS Trust, London, United Kingdom, [3]Queen Mary University of London, SHARE Collaborative, Wolfson Institute of Population Health, London, United Kingdom, [4]Queen Mary University of London, Pragmatic Clinical Trials Unit, Wolfson Institute of Population Health, London, United Kingdom, [5]University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, [6]Guys and St Thomas' NHS Trust, London, United Kingdom, [7]King's College London, School of Immunology & Microbial Sciences, London, United Kingdom, [8]Chelsea and Westminster Hospital NHS Foundation Trust, London, United Kingdom, [9]University Hospitals Sussex NHS Foundation Trust, Brighton, United Kingdom, [10]Liverpool University Hospitals NHS Foundation Trust, Liverpool, United Kingdom, [11]Royal Free London NHS Foundation Trust, London, United Kingdom, [12]University College London, Institute for Global Health, London, United Kingdom

Background: Delivery of long-acting injectable cabotegravir and rilpivirine (CAB+RPV-LA) in community settings may relieve capacity pressures on clinics, but there is limited evidence on implementation. We conducted surveys with healthcare providers in the clinic (HCPs) and community (CHCPs) as part of the first study about delivery of CAB+RPV-LA in community settings in the United Kingdom.
Methods: ILANA is a 12-month implementation study where people with HIV received 2-monthly CAB+RPV-LA in clinic for months (M) 1-6, then in clinics or community settings for M6-12. Longitudinal survey data from providers are reported from M0 (HCPs only), M8 (CHCPs only) and M12 (both groups).
We present descriptive analyses of endpoints: Feasibility of Intervention Measure (FIM), Acceptability of Intervention Measure (AIM), and Intervention Appropriateness Measure (IAM), and implementation barriers.
Results: 25 staff participated – 18 HCPs and 7 CHCPs. 28.0% doctors, 68.0% nurses; 68.0% - mostly nurses – administered CAB+RPV-LA injections.
Among both groups, mean FIM/AIM/IAM scores for delivering the injection in their treatment setting were high (>4) at M0/M8 and M12. Among HCPs, FIM/AIM/IAM mean (SD) scores improved M0-M12, by +0.61 (1.16), +0.38 (1.07) and +0.61 (1.09), respectively. Among CHCPs, FIM mean (SD) scores improved slightly M8-M12 by +0.20 (0.33), while AIM/IAM mean (SD) scores declined slightly by -0.15 (0.65) and -0.15 (0.49), respectively.
Among HCPs, top barriers at M0 were patient-, site- and injection-related (all 61.1%, N=18) (Figure 1). At M12, the top barrier was patient ability to keep appointments (50%, N=14). Among CHCPs, the top barrier at M8 was staff preparation (57.1%, N=7). At M12, it was risk of drug resistance (57.1%, N=7).



Conclusions: Feasibility, acceptability, and appropriateness of CAB+RPV-LA delivery is high among HCPs and CHCPs, but barriers to implementation differ over time and by setting. Sample size and missing data mean cautious interpretation is required. Nevertheless, findings offer insights for optimising CAB+RPV-LA in different settings.

EP0890

Improving HIV-related knowledge and reducing stigma attitudes in healthcare settings among medical and nursing students participating in the HIV S&D e-learning, a piloted project in 10 universities in Thailand, 2024

A. Pakdeepinid[1], T. Teerawantanee[1], O.-o. Prajankett[2], P. Wisawatapnimit[3], W. Munsakul[4], P. Dinchuthai[5], P. Inchai[5], W. Chumwong[3], N. Chumpa[6], W. Maneesriwongul[7], S. Muktier[8], S. Northbrook[8], R. Lolekha[8]

[1]Division of AIDS and STIs, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, [2]The Royal Thai Army Nursing College, Phramongkutklao Hospital, Bangkok, Thailand, [3]Boromarajonani College of Nursing, Bangkok, Faculty of Nursing, Praboromarajchanok Institute, Nonthaburi, Thailand, [4]Faculty of Medicine Vajira Hospital, Navamindradhiraj University, Bangkok, Thailand, [5]Faculty of Medicine, Burapa University, Chonburi, Thailand, [6]Thai Red Cross Emerging Infectious Diseases Clinical Center, King Chulalongkorn Memorial Hospital, Bangkok, Thailand, [7]Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Bangkok, Thailand, [8]Division of Global HIV and Tuberculosis, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand

Background: People living with HIV (PLHIV) have reported discrimination from healthcare providers. In Thailand, medical and nursing students have displayed moderate HIV knowledge, with some holding stigmatizing attitudes toward PLHIV. We evaluated HIV-related knowledge and

stigma attitudes before and after participating in the Ministry of Public Health (MOPH) Stigma & Discrimination (S&D) e-learning program.

Methods: Thailand's MOPH and universities adapted the HIV S&D e-learning video from DriStri for Thai audiences. The 90-minute video consists of six modules covering topics, including S&D definition, its impact on the HIV epidemic, and universal precautions, 25 pre-/post-test questions (17 knowledge questions and eight stigma attitude questions on a Likert scale, where 1 is no stigma). We ensured that only questions with a reliability alpha of >0.7 were included.

A convenience sample of medical and nursing students from ten schools in Bangkok, Nonthaburi, and Chonburi participated from June to July 2024, completing online pre-/post-tests before and immediately after the modules after providing electronic consent. SPSS software was used to analyze changes in attitudes and knowledge scores.

Results: The survey included 811 students: 241 (30%) third and fourth-year medical students and 570 (70%) first and fourth-year nursing students. Of the participants, 88% were female. Compared to the pre-test and post-test, HIV knowledge scores improved from 9.44 to 15.26 ($p < 0.001$). HIV stigma scores decreased (14.6 vs. 11.9, $P<0.001$), including the discomfort level in providing services to PLHIV, concerns about contracting HIV, and negative attitudes toward HIV and key populations. Year 3 and 4 students had higher knowledge scores (15.4 vs. 15.0, $P<0.001$) and lower stigma attitudes than first-year students (11.4 vs. 12.9, $P<0.001$).

More than 90% of the students reported being highly satisfied with the e-learning modules and suggested shortening the video and including the "Undetectable = Untransmittable" message in the materials.

Conclusions: After participating in the S&D e-learning program, students demonstrated an increase in their HIV knowledge scores and a decrease in S&D attitude scores. The students reported high levels of satisfaction with the S&D e-learning program. The MOPH plans to simplify the video based on feedback and expand this program to enhance S&D reduction in health facilities.

EP0891

Expanding access to HIV care for migrants in host countries - a new mechanism for scaling up treatment

D. Korenev[1], K. Barskiy[1,2], Z. Abrosimova[2]

[1]Fund for Prevention of Socially Significant Diseases "Steps", Moscow, Russian Federation, the, [2]Regional Expert Group on Migration and Health, Tbilisi, Georgia

Background: Despite the political context, migrants from EECA continue travel to Russia. At the same time, according to the Russian Law on Prevention the Spread of HIV, migrants who have been diagnosed with HIV, should leave the country. But many migrants are unable to return to their home countries due to different factors and majority of them remain in host nation undocumented. Lack of access to health services, including Global Fund programs, instigates health deterioration of migrants with HIV and contributes to development of epidemic in EECA countries.

Description: In 2021, the Steps Fund, in cooperation with the Regional Expert Group on Migration and Health, initiated and implemented a new unique approach for providing treatment to people in migration — "A mechanism for remote registration and treatment". The essence of the model is an option for people with HIV being in migration to register at AIDS Centers in the country of origin remotely and receive ART and monitoring without returning home. This model ensures the provision of continuous care anywhere in the world.

Lessons learned: This strategy has shown high-quality results — remote registration and treatment model has been launched in several countries of the EECA: Moldova (2021), Tajikistan, Kyrgyzstan (2022), Kazakhstan, Uzbekistan (2024). By 01.2025 the Steps Fund assisted to remote registration for 68 migrants and became a reliable hub for the point of ART delivery from countries of origin.

Migrants with HIV undergoing remote monitoring show high adherence and reach undetectable viral load (Figure). This model can be replicated to other regions and diseases.

Viral load measurement

	At the beginning of the program	After 1 year in the program
P1	68 000	53
P2	84 478	0
P3	160 000	0
P4	63 000	0
P5	1 700	0
P6	5 720	0
P7	850 000	0
P8	10 000	0
P9	1 800 000	0
P10	110 000	0
P11	3 021 070	584
P12	100 000	214
P13	800 000	0
P14	31 588	100
P15	280	0
P16	49 555	0
P17	1 400	0
P18	25 000	0

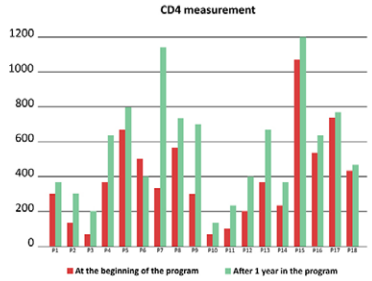


Figure. Measuring dynamics of key indicators of "Remote registration and treatment" program sample participants - migrants with HIV - implemented by Steps Fund

Conclusions/Next steps: This model is unique and shows high efficiency. Receiving ART from the country of origin is a sustainable health care delivery model, especially in countries that do not provide treatment to migrants. It prevents epidemiological consequences for the entire region. Cross-border collaboration is essential in preventing the spread of HIV.

EP0892

Leveraging community systems strengthening to increase HIV client enrolment into differentiated service delivery (DSD) models in Western Zimbabwe 2023-2024

S. Mukungwa[1], T. Makoni[1], C. Mademutsa[1], W. Mukuwapasi[1], L. Muremba[1], T. Mwareka[1], W. Mlilo[2], K.A. Thompson[3], T. Maphosa[4], H.J. Cham[4]
[1]Zimbabwe National Network of People living with HIV, Harare, Zimbabwe, [2]Zimbabwe Technical Assistance, Training & Education Center for Health (Zim-TTECH), Harare, Zimbabwe, [3]International Training and Education Center for Health, University of Washington, Washington, American Samoa, [4]Division of Global HIV and TB (DGHT), U.S. Centers for Disease Control and Prevention (CDC), Harare, Zimbabwe

Background: Differentiated Service Delivery (DSD) models are integral to achieving universal health care, particularly in the context of chronic disease management for people living with HIV (PLHIV). These models have been developed to provide tailored care based on a client's specific health status, social situation, and treatment goals, yet client enrolment in these models remains a challenge in rural Zimbabwe.
Description: To increase enrolment in DSD in Mashonaland West Province, 90 Community Health Advocates (CHAs) were employed, and 18 Community Consultative Dialogues (CCDs) were conducted between January and August 2024. These feedback sessions with PLHIV, health care workers, and local leadership helped to identify current barriers to DSD enrolment.
After the CCDs, CHAs served as facilitators to improve linkages between health facilities and the community, conducting outreach activities, providing education, and assisting clients in navigating the DSD enrolment process.
Lessons learned: CCDs identified internalised stigma and discrimination as the major barriers to DSD enrolment. Community engagements by CHAs improved client understanding and acceptance of DSD, enhanced credibility and reduced stigma associated with enrolment.
Within the first 6 months the program referred a total of 1,336 clients for DSD enrolment, and 91% (1,213) enrolled. Comparing with the previous six months clients that were referred for DSD enrolment increased by 622% (1336) from t185 clients. DSD enrolment data indicated a strong preference for flexible service delivery options such as family refill (34%), community-based ART refill groups (22%) and fast track (15%).
Also used by clients were club refill groups (11%) and the Malaicha model (0.01%), a new DSD model adapted for Anti-Retroviral Therapy (ART) refills for migrant PLHIV living outside Zimbabwe, hence promoting effective avenues for ART medication collection for migrant PLHIV.
Conclusions/Next steps: CCDs highlighted the valuable role of continuous feedback in adapting enrolment strategies to align with community needs and preferences in tackling systemic barriers to DSD enrolment, such as stigma and can ensure that community members possess equitable knowledge about DSD. Emphasizing this approach not only can enhance enrolment outcomes but also can foster an inclusive environment for everyone to access and benefit from these vital services.

EP0893

Differentiated service delivery for viral load in Zimbabwe

C.R. Giyava[1], T. Maparo[1], E. Govha[2], J. Jokwiro[1], S. Chipuka[2], C. Mupanguri[2], T. Apollo[2], N. Kawaza[1], A. Kallarakal[3], C. Chimhundu[3], Y. Tsai[3], J.C. Graves[3], M.L. Prust[3]
[1]Clinton Health Access Initiative, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Harare, Zimbabwe, [3]Clinton Health Access Initiative, Boston, United States

Background: HIV programs in high-burden settings have scaled differentiated service delivery (DSD) models, reducing reliance on facility settings for key HIV services. Viral load (VL) testing is essential for managing HIV. However, healthcare worker (HCW) time, shortages contribute to challenges with timely VL sample collection. Dried blood spots (DBS) tests are widely used for VL testing in low-resource settings as an alternative to plasma-based tests. DBS testing for other purposes such as early infant diagnosis of HIV has been successfully task-shifted to community health workers and other community lay cadres (CLCs).
To inform potential DSD models for VL, this study assessed the feasibility and acceptability of CLC collection of DBS samples for VL testing in Zimbabwe as compared to DBS sample collection by trained HCWs.
Methods: This study was conducted in 10 public health facilities in Zimbabwe over 6 weeks in March-April 2024. Two DBS samples were collected from 374 participants; a HCW-collected reference sample and a CLC-collected validation sample. A sub-sample of CLC collections were observed using a checklist, and surveys were conducted with both participating clients and CLCs.
Results: No DBS samples were rejected by the laboratory, but two samples (one HCW-collected and one CLC-collected) were classified as invalid. Of the 372 paired tests analyzed, 96.0% (95% CI 93.2-97.7%) of pairs had matching results (i.e. both designated as suppressed or unsuppressed). Among observed CLC sample collections, all critical items in the checklist were done properly in 90.2% (95% CI 85.7-94.7%).
All CLCs reported that they were confident to conduct DBS sample collection correctly, and 94% and 86% of clients were open to CLC and community-based sample collection, respectively.
Conclusions: VL DBS results for samples collected by CLCs were comparable to the results from samples collected by HCWs, and CLCs demonstrated the ability to correctly and effectively collect VL DBS samples. Clients reported CLC and community-based sample collection to be acceptable and even preferred for many.
Results from this assessment indicate that task-shifting VL DBS sample collection to CLCs is a feasible strategy. This opens opportunities to explore community-based DBS sample collection as a form of DSD.

EP0894

User preferences of ART Differentiated Service Delivery Model in Zimbabwe: a discrete choice Experiment

S. Mukungwa[1], T. Makoni[1], G. Kadziyanike[1], C. Mademutsa[1], W. Mukuwapasi[1]
[1]Zimbabwe National Network of People Living with HIV, Harare, Zimbabwe

Background: The Antiretroviral Therapy (ART) Differentiated Service Delivery (DSD) model represents a significant shift in HIV care, aiming to enhance treatment adherence and client satisfaction. Traditional ART delivery often results in overcrowded facilities and disengaged clients which can hinder effective treatment. The DSD model was introduced to provide tailored services that better align with the diverse needs of people living with HIV(PLHIV). Even after such efforts the uptake of DSDs has remains low.

Methods: This study employed a mixed-methods approach, combining quantitative surveys in 25 districts form August 2022-July 2023. A Discrete Choice Experiment (DCE) survey was administered to PLHIV from various districts, combining desk reviews and interviews. 75 Community HIV/AIDS Support Agents (CHASAs), who are community members living with HIV, were trained to collect data via questionnaires using the CommCare data collection platform.

Random sampling technique was used to obtain current or potential users of DSD models as they left the facility after their ART pick-up or after concluding their support group meetings.

The sample size per CHASA was proportional to the contribution that each facility made to the total number of people on ART in the 75 selected facilities.

Results: 2056 PLHIV were interviewed, 95% knew about DSDs and 77% were in DSD models. Results indicated a strong preference for flexible service delivery options, such as Community-based Art Refill Groups (CARGs)(53%), fast track(25%) and family refill(15%). In urban areas fast track model was more prolonged than the CARGs while in rural settings CARGs are more prominent.

Community systems strengthening played a pivotal role facilitating the enrolment of clients into DSD models 68% had been in DSD models for between 1-2 months. 71% of clients wanted to change or join different DSD models with 25% moving to fast track, 20% CARGS and 16% family, respectively. PLHIV reported in DSDs increased satisfaction and improved adherence

Conclusions: To optimize the ART DSD model, it's essential to expand partnerships with community organizations can facilitate outreach and support for underserved populations. Implementation research is needed to continuously assess client preferences and outcomes, ensuring that the DSD model evolves to meet the changing needs of those on ART.

EP0895

Implementation of Vietnam's first mobile application for self-monitoring and management of ARV treatment in people living with HIV in Ho Chi Minh City (2022-2024)

H.N. Le[1], Q.T. Dinh[2], H. Van[3], M.H. Duong[3], V.D. Nguyen[3], V.T. Nguyen[4], D.M. Pham[5], V.N. Nguyen[6], H.D. Bui[6], T.D. Pham[7], T.T.H. Le[7], K.D. Nguyen[7], T.V. Nguyen[7], T.Y.H. Luong[8], T.M.H. Bui[9], H.N. Nguyen[8], T.K.C. Nguyen[8], C.Q. Nguyen[9], T.A. Nguyen[9], M.S. Pradyuman[9]
[1]Ho Chi Minh Center for Disease Control, Vice Director, Ho Chi Minh City, Viet Nam, [2]Ho Chi Minh City Center for Disease Control, Information Technology, Ho Chi Minh City, Viet Nam, [3]Ho Chi Minh City Center for Disease Control, HIV/AIDS Prevention and Control, Ho Chi Minh City, Viet Nam, [4]Ho Chi Minh City Department of Health, US.CDC-HDOH Project, Ho Chi Minh City, Viet Nam, [5]Vietnam Administration for HIV/AIDS Control, Vice Director, Hanoi, Viet Nam, [6]Vietnam Administration for HIV/AIDS Control, HIV Surveillance and Testing, Hanoi, Viet Nam, [7]PATH, HIV Health Information System, Hanoi, Viet Nam, [8]U.S. Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Global Health Center, Ho Chi Minh City, Viet Nam, [9]U.S. Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Global Health Center, Hanoi, Viet Nam

Background: Ho Chi Minh City (HCMC) is home to approximately 48,000 people living with HIV (PLHIV) receiving antiretroviral therapy (ART), representing one fourth of all PLHIV on ART in Vietnam. Given the large population and the complexity of managing ARV treatment, there is a growing need for efficient and innovative solutions that support PLHIV in self-monitoring and managing their health. To address this need, iCare, a mobile health application, was developed and launched in HCMC in 2022 for the first time in Vietnam.

Description: The iCare system is interoperable with Electronic Medical Record (EMR) in HCMC, enabling real-time synchronization of treatment data. iCare provides PLHIV with access to ARV treatment-related and essential health information, including appointments and medication reminders, explanations of HIV-related lab results, and an interactive chatbot. Additionally, the app facilitates appointment rescheduling and virtual consultations for app users.

Lessons learned: As of November 2024, of 29 outpatient clinics (OPCs) in HCMC implementing iCare, 61.7% (26,951/43,713) PLHIV on ART have used the iCare app. The coverage of iCare app users varies across OPCs, regardless of when the app implementation began. When grouping OPCs by duration of implementation (6 months, 1 years, 1.5 years, and 2 years), clinics that implemented the app for 6 months show the highest coverage (65%), while those that have implemented it for 2 years show the lowest coverage (25.5%). The highest coverage (99.5%) was observed among 951 PLHIV on ART at OPC Phu Nhuan, which has implemented the iCare app for 6 months.

Conclusions/Next steps: The iCare app has attracted a significant number of users, covering over three-fifth of the PLHIV on ART in HCMC. However, varying coverage

across OPCs underscores the need for further evaluation to understand why coverage remains low at OPCs where the app has been implemented for a longer period. An evaluation is planned for early 2025 to evaluate the app's effectiveness in improving treatment outcomes, gather user feedback, and gain insights on its implementation. Additionally, efforts will be made to expand the app's coverage in HCMC and explore opportunities for extension to other provinces.

EP0896

Interest in long-acting injectable antiretroviral therapy (ART) among adults living with HIV newly starting or restarting ART in Cape Town, South Africa

T. Phillips[1], M. Zondo[1], P. Sele[1], B. Solinjani[1], B. Chi[2], L. Knight[1], L. Myer[1], C. Orrell[3]
[1]University of Cape Town, School of Public Health, Cape Town, South Africa, [2]University of North Carolina at Chapel Hill, Chapel Hill, United States, [3]University of Cape Town, Desmond Tutu HIV Centre, Cape Town, South Africa

Background: Long-acting injectable ART (LA ART) has been shown to be safe and effective for people living with HIV (PLH), and superior among those with adherence challenges to oral regimens.
As such agents become more accessible, understanding perceptions in different population groups is crucial for effective implementation.
Methods: As part of a cross-sectional survey at two large peri-urban clinics in Cape Town, South Africa, adults starting or restarting ART responded to a Likert scale question about their interest in LA ART. This was followed by an open-ended question completed by all participants to comment on their response. We thematically coded the open-ended text and used descriptive statistics to describe responses including variations by gender and start/restart status.
Results: Among 329 participants (61% women; 71% restarting ART; median age 39 years), 242 (74%) responded that that would be very interested in trying LA ART, 51 (15%) were somewhat interested or unsure, and 36 (11%) were not interested. Common reasons for interest in LA ART were to avoid daily tablets and the perceived convenience of injections. Participants spoke specifically about removing the stress over daily adherence, which would save time and "free your mind" to concentrate on other things. Participants valued the discretion of not carrying pill bottles so "no one will know" about them and felt that having the injection "in their system" would make them more consistent with their treatment. Concerns about LA ART included fear of injections and potential side effects. Some respondents preferred to hear about experiences from other people using LA ART before making their own decision. Two participants expressed interest in LA ART only if the injection lasted at least one year. Responses were consistent across gender and start/restart groups.
Conclusions: Given the high risk for discontinuing ART within the first year, the burden of pill fatigue, and substantial interest in LA ART, adults starting and restarting ART should be considered for these technologies. Client perceptions and concerns must inform the development of LA ART formulations and implementation plans.

EP0897

Referral to differentiated antiretroviral therapy delivery at 6 months after initiation: a retrospective cohort study in KwaZulu-Natal, South Africa

K.R. Tlhaku[1,2], J. van der Molen[1], L. Lewis[1,3], Y. Sookrajh[4], L. Hobe[5], T. Ngwenya[6], M. Khanyile[1], T. Khubone[4], N. Garrett[1,2], J.A. Brown[1,7], J. Dorward[1,7]
[1]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [2]University of KwaZulu-Natal, School of Nursing and Public Health, Discipline of Public Health Medicine, Durban, South Africa, [3]University of Cape Town, Department of Statistical Sciences, Cape Town, South Africa, [4]eThekwini Municipality Health Unit, Durban, South Africa, [5]Mseleni Hospital, Umkhanyakude District, South Africa, [6]Bethesda Hospital, Umkhanyakude District, South Africa, [7]University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom

Background: The World Health Organization recommends differentiated service delivery (DSD) after 12 months of antiretroviral therapy (ART). Since April 2020, South Africa has allowed for referral to decentralized ART programs just 6 months after ART initiation ("early DSD"). We aimed to evaluate the uptake of early DSD and subsequent clinical outcomes.
Methods: We performed a retrospective cohort study using routine, de-identified data from 125 public clinics in KwaZulu-Natal, South Africa. We included people with HIV aged ≥16 years, newly initiated on ART and virally suppressed (≤50 copies/mL) after 6 months. We assessed uptake of early DSD at 6 months (window: <270 days) among people initiating ART between January 2020 and December 2022, and clinical outcomes of retention-in-care (not late for a visit by >90 days) and viral suppression <50 copies/ml at 12 months among people initiating ART between January 2020 and March 2022 and followed up until September 2023. We used logistic regression models adjusting for gender, age, ART regimen and baseline CD4 to compare outcomes between early DSD versus delayed or no referral to DSD.
Results: Among 25,272 people eligible for early DSD, 15,182 (60%) were women and the median age was 33 years (IQR 27-40). 2,727 (10.8%) received early DSD, at a median of 218 days (IQR 197 to 230) after ART initiation. Rates of early DSD increased from 6.3% of those initiated in Q1 2020 to 15.7% of those initiated in Q4 2022. Among 19,162 participants with outcome data, 1,893 (9.9%) received early DSD. The proportion retained in care at 12 months was 15,167/17,269 (88%) for those without and 1,762/1,893 (93%) for those with early DSD (aOR 1.85; 95% CI 1.54, 2.23; p<0.001). Among those retained in care, a 12-month viral load result was available for 14,937/16,929 (88.2%), and of these 12,139/13,435 (90.4%) without and 1,375/1,502 (91.5%) with early DSD were virally suppressed (aOR 1.13; 95% CI 0.93-1.37; p=0.2).

Conclusions: Uptake of early DSD was low, but was not associated with worse clinical outcomes. Research into barriers to implementation of early DSD, and policies to facilitate early referral, are required.

EP0898

Leveraging the CDDP+ model to improve PMTCT service delivery at Health Center IIs in Bunyoro region, Mid-Western Uganda from July 2020 to September 2024

N. Matovu[1]

[1]Baylor Foundation Uganda, Medical & Psychosocial, Kampala, Uganda

Background: Ministry of Health Uganda adopted the triple 95 UNAIDs-targets, however, by July 2020, only 92% of pregnant women (PW) knew their HIV-status at their first antenatal care (ANC-1) visit at 282 health facilities (HFs) in Bunyoro. Health Center IIs (HCII) constituted 40% (112/282) of HFs and 19% (25531/133309) ANC-1 attendance. Only 17/112 HCIIs provided comprehensive prevention of mother-to-child-transmission (PMTCT) services. Percentage of PW with known HIV status at ANC-1 (PMTCT_STAT), percentage of HIV-positive PW who received anti-retroviral treatment (ART) to reduce the risk of mother-to-child-transmission during pregnancy (PMTCT_ART) and the percentage of infants born to HIV-positive women who received a first virologic HIV test by 12 months of age (PMTCT_EID) at HCIIs was 89%,78% and 27%, respectively. This performance at the HCIIs was attributed to poor infrastructure, staffing, knowledge gaps on PMTCT standards, testing kit shortage, and non-availability of ART. The team set out to use a modified community drug distribution point plus (CDDP+) model at HCIIs offering ANC-1 services to improve access to PMTCT services.

Description: Baylor Foundation Uganda (BFU) engaged Assistant District Health Officers for Maternal-Child-Health and Biostaticians, conducted data review meetings for PMTCT indicators at HCIIs and identified 55 HCIIs with the highest ANC-1 attendances, trained Midwives, and supported monthly onsite mentorship by experienced mentor midwives from higher level facilities (HLFs). Village health teams and peer mothers were engaged to register, mobilize pregnant mothers through a door-to-door approach, and offer ongoing psychosocial support for retention. Existing hub-riders were re-routed to transport Early Infant Diagnosis (EID) samples. HLFs provided data tools and PMTCT commodities. ANC-1 data were reported by HCIIs while ART data were reported by the supporting HLFs into DHIS2. CDC funded minor site-modifications at selected HCIIs, while all 55 HCIIs received ANC/PMTCT equipment.

Lessons learned: Data use, monthly mentorships to Midwives and scale-up of PMTCT implementation to HCIIs using the CDDP+ model improved PMTCT_STAT from 89% to 98%, PMTCT_ART from 78% to 95%, while PMTCT_EID improved from 27% to 73%, respectively.

Conclusions/Next steps: The CDDP+ model was a simple and effective way to differentiate health care for PW at HCIIs. BFU is scaling up the intervention to additional HCIIs.

EP0899

Using routine data to predict treatment interruption in 2024: a case of Petauke district Hospital, Zambia

T. Malebe[1], M. Goma[1], M. Chilambwe[1], C. Magumba[1], P. Mutale[1], A. Chomba[1], S. Sifaya[1], J. Msofe[2], H. Satti[3], M. Ngambi[4], L. Mwiinga[5], C.F. Walker[6]

[1]FHI 360, HIV, Lusaka, Zambia, [2]FHI 360, HIV, Dar es Salam, Tanzania, the United Republic of, [3]FHI 360, HIV, Dubai, United Arab Emirates, the, [4]Ministry of Health, Health, Chipata, Zambia, [5]CDC Zambia, Public Health, Lusaka, Zambia, [6]FHI 360, HIV, Washington, United States

Background: Interruption in treatment (IIT) remains a significant challenge in HIV treatment programs. Zambia recorded IIT rates averaging 2.5% during January to September 2024. Understanding characteristics and factors associated with IIT can provide opportunities to design strategies that can optimize retention in care.

Description: We conducted a retrospective analysis of routine program data from electronic medical records for the period January to September 2024. Records from 5,717 recipients of care (ROCs) who accessed ART services during this period were analyzed, including ROCs who were active on treatment and those who experienced IIT for ≥28 days.

A multivariable logistic regression analysis was conducted to profile risk factors associated with ROCs who had an IIT. Predictor variables age, sex, having an active mobile phone contact, multi-month dispensing (MMD), and viral load suppression status were included in the model. The outcome variable of interest was IIT. Predicted probabilities for IIT were computed across different ROCs profiles using margins analysis, and results were validated through receiver operating characteristic curves.

Lessons learned: Results showed that females were less likely to experience IIT compared to males (aOR: 0.71, $p = 0.003$). ROCs receiving any MMD were significantly less likely to experience IIT compared to those not on MMD (aOR: 0.33, $p < 0.001$).

Additionally, ROCs without an active mobile phone contact were more likely to experience IIT compared to those with a mobile phone contact (aOR: 1.46, $p < 0.002$). The predicted probability showed that male ROCs across all age groups who have a history of unsuppressed viral load (>1,000 copies/mL) coupled with not on MMD and without an active mobile phone contact were at a higher risk of experiencing IIT compared to females with suppressed viral load, on MMD, and with aa active mobile phone contact. Particularly, the profile male in the 15-19 age group who were not on MMD and had unsuppressed viral load had the highest probability (predicted probability = 0.19, $p = 0.001$).

Conclusions/Next steps: Data analysis identified key predictors of IIT. These results demonstrated the importance of using MMD, updating mobile phone contacts, and regular follow-ups for targeted sub-populations to prevent IIT and improve retention in care.

EP0900

Cohort monitoring by village: a human centered strategy for viral load monitoring for PLHIV in ART care in rural Gwanda, Matabeleland South province, Zimbabwe

T.W. Nhapi[1], A. Chindore[1]
[1]Organiztion for Public Health Interventions & Development (OPHID), Programs, Harare, Zimbabwe

Background: Routine viral load (VL) monitoring is critical for determining antiretroviral treatment (ART) efficacy and Zimbabwe targets to achieve ≥80% VL coverage. In April 2022, we identified a significantly low VL sample collection at Garanyemba Clinic of 3% by mid-year despite an VL collection coverage of 70% in Gwanda district.
This was attributed to poor cohort filing of client ART records making it difficult to determine when clients were due for VL sample collection. We therefore set a goal to increase cohort VL sample collection to 65% by December 2022.
Description: In July 2022, we monitored clinic processes and analyzed data on VL collection from January – June 2022 which guided our strategy. Using these observations, we implemented a village-based cohort approach to VL sample collection, targeting clients from 6 hard-to-reach villages within Garanyemba clinic, Gwanda catchment area starting in July 2022.
We added village of residence to the month of ART initiation to our definition of a cohort. Clients were mobilized monthly from their villages for sample collection at designated health posts by Community Outreach Agents (COAs) and Village Health Workers by cohort, based on their month of ART initiation. This was integrated with ART refills, TB and cervical cancer screening, and management of minor ailments. Progress was tracked monthly through DHIS2 and visualized through automated PowerBi dashboards to monitor trends and evaluate the effectiveness of our methodology.
Lessons learned: Overall, 566 clients were reached at six health posts, significantly improving cohort VL sample collection from 3% to 74% by November 2022—exceeding our target. This performance has been maintained above 75% to date. One health post alone reached 123 clients in its inaugural session. All clients were screened for TB with 8 (1.4%) presumed and tested. Those HIV positive women screened for cervical cancer were 253.
Conclusions/Next steps: Our village-based cohort strategy proved effective in improving VL collection coverage, by addressing logistical challenges and leveraging community engagement, particularly in this remote, sparsely populated and hard-to-reach rural setting.
The integration of services improved client turnout, facilitated efficient appointment scheduling, and streamlined client mobilization for VL sample collection with defaulter tracking.

EP0901

The effect of age-appropriate disclosure on adherence to antiretroviral therapy and viral load suppression among adolescents living with HIV in Edo State, Nigeria

J. Jackson[1], C. Umeh[1], M. Omololuoye[1], B. Ochonye[1], M. Ikpeme[2], D. Ogundehin[2], O. Igboelina[2], E. Roderrick[1], N.-F. Yusuff[1], O. Kanu-Oji[1], O. Ogungbade[3]
[1]Heartland Alliance Limited by Guarantee (HALG), Abuja, Nigeria, [2]USAID Nigeria, Abuja, Nigeria, [3]West Africa Center for Public Health and Development (WACPHD), Lagos, Nigeria

Background: Adolescents living with HIV (ALHIV) face unique challenges that can impact adherence to antiretroviral therapy (ART) and viral load suppression. Age-appropriate disclosure of HIV status has been identified as a potential intervention to improve these outcomes.
This study aims to evaluate the effect of age-appropriate disclosure on adherence to ART and viral load suppression among adolescents aged 10–19 years receiving ART in Edo State, Nigeria.
Methods: A cross-sectional study was conducted among 1133 adolescents receiving ART across 28 facilities in Edo State. The data source was the Pediatric Disclosure checklist abstracted from the medical records (folders) of the clients in the cohort. Participants were categorized into two groups: those who had undergone age-appropriate disclosure (n=1097) and those who had not (n=36). Data were collected on ART adherence (defined as ≥95% medication adherence) and viral load suppression (defined as 1000 copies/mL).
While descriptive statistics was used to summarize adherence and suppression rates across the two groups, Chi-square tests was employed to compare proportions of adherence and suppression between the groups.
Odds ratios (ORs) with 95% confidence intervals (CIs) was valuable in quantifying the association between age-appropriate disclosure and outcomes. Multivariate logistic regression was used to adjust for potential confounders, such as age and duration on ART.
Results: Adolescents who received age-appropriate disclosure had significantly higher adherence rates (97%) compared to those who had not (67%) ($p < 0.001$). Similarly, viral load suppression rates were higher in the disclosure group (91%) compared to the non-disclosure group (75%) ($p < 0.001$). Age-appropriate disclosure was associated with a 7.3-fold increased likelihood of adherence (OR: 7.3; 95% CI: 3.2–16.8) and a 3.9-fold increased likelihood of viral load suppression (OR: 3.9; 95% CI: 1.9–8.2) after adjusting for confounders.
Conclusions: Age-appropriate disclosure significantly improves ART adherence and viral load suppression among adolescents living with HIV in Edo State, Nigeria.
These findings underscore the importance of integrating disclosure interventions into adolescent HIV care programs to optimize treatment outcomes. Further research should explore strategies for effective disclosure.

EP0902

Leveraging Differentiated Service Delivery (DSD) models to improve and sustain HIV care services in Burundi military settings

J.M.F. Karemera[1], B. Nunu[1], J. Biziragusenyuka[2], F. Kavabushi[2], D. Nizigama[3]
[1]PSI Burundi, Bujumbura, Burundi, [2]DHAPP Burundi, Bujumbura, Burundi, [3]Burundi National Defense Force, Bujumbura, Burundi

Background: Burundi, a low-resourced country in East Africa, faces challenges in delivering HIV services particularly to populations in semi-closed settings like the military. Military-specific barriers, including frequent mobility due to border deployments, peacekeeping missions, and operational demands, compound broader challenges such as limited transportation access and outbreaks like COVID-19 and Mpox.

To address theses barriers, Differentiated Service Delivery (DSD) care models were introduced in military healthcare settings starting in 2022, aiming to improve and sustain access to HIV prevention, care, and treatment services.

Description: This study is a retrospective secondary analysis of program data from the Department of Defense, collected between October 2019 and September 2024 from nine military sites. The program targeted military personnel, and their families through three main DSD approaches including community adherence groups (CAGs), outreach services, and facility-based adherence groups. The expansion of these care models was accelerated during the COVID-19 pandemic, under the guidance of the ministry of health, to ensure the continuity and quality of services. To evaluate the access, data on pre-exposure prophylaxis (PrEP) uptake, and viral load (VL) coverage and suppression were analysed descriptively using Microsoft Excel.

Lessons learned: By 2024, 98% (n=4,215) of PLHIV in these facilities, of whom 2,551 (61%) were women, were enrolled in DSD models: 2,030 (48%) in CAGs, 888 (21%) in outreach services, 1,297 (31%) in adherence groups. These approaches increased access to VL testing, which increased from 66% in September 2019 (pre-COVID-19) to 92% in 2021 and was sustained at 95% by September 2024.

Similarly, viral suppression improved from 91% in 2019 to 97% in 2021 and remained stable thereafter. PrEP implementation, initiated in 2022 with 140 clients, steadily expanded, reaching 336 new initiations by 2024.

Conclusions/Next steps: The implementation of DSD models in military settings has significantly enhanced HIV prevention and treatment care outcomes.

The decentralization and integration of differentiated community-based services remain crucial for addressing persistent access challenges and closing the remaining gaps to achie.ve the UNAIDS 95-95-95 targets.

Lessons learned from this program inform broader strategies to improve HIV care in other resource-limited or conflict-affected settings.

EP0903

Treatment outcomes of mobile clients on ART: insights from AHF's collaborative ART clinic, Nepal (2016–2023)

M.R. Pant[1], D.R. Joshi[1], M. Pagnaroat[2], U. Shrestha[3], A.B. Rai[3], A.P. Poudyal[3], D. Bhandari[1], S.B. Kamar[4], L.R. Paneru[4]
[1]AIDS Healthcare Foundation Nepal, Program and Management, Lalitpur, Nepal, [2]AIDS Healthcare Foundation Asia Bureau, Phnom Penh, Cambodia, [3]AIDS Healthcare Foundation Nepal, Monitoring and Evaluation, Lalitpur, Nepal, [4]Seti Provincial Hospital, Medicine, Dhangadhi, Nepal

Background: Retention in antiretroviral therapy (ART) programs is a cornerstone of effective HIV care and control. Migrant populations often face unique challenges that influence their ability to remain engaged in care.

This study evaluates retention trends and associated predictors among Nepalese migrants enrolled in an AHF-supported ART clinic in Seti, Nepal.

Methods: A retrospective cohort analysis was conducted using clinical data from 631 Nepalese migrants who initiated ART between 2016 and 2023. Retention was defined as being actively on treatment as of the latest follow-up. Descriptive statistics, stratified by demographic and clinical variables, were used to identify predictors of retention.

Results: From March 2016 to December 2023, 631 clients were enrolled. By current date of analysis, out of the total, 420 clients remain active (66.6%), while 211 (33.4%) were categorized as lost to follow-up (LFU) or transferred out or death. Tuberculosis (26%) was identified as the leading cause of death, followed by advanced AIDS (14%). Retention rates were higher among younger individuals and those enrolled in family-supported dispensing models compared to self-dispensing approaches.

The majority of active clients benefit from multi-month dispensing (MMD) with durations of 2–3 months (97%). The highest retention duration is 5 years, with 70 clients (16%), while the lowest is 8 years, with 30 clients (7%).

Conclusions: Older individuals and those relying on self-dispensing methods faced significant challenges in retaining in care. Expanding family-supported ART delivery and optimizing MMD durations are critical strategies to enhance retention in this vulnerable group.

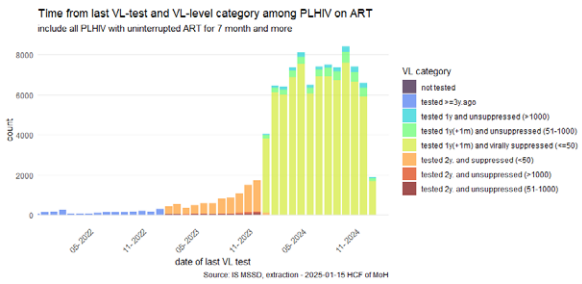
Further research is needed to explore additional barriers and facilitators to sustained engagement in HIV care.

EP0904

The importance of a differentiated, patient-centered approach in cases of missed routine viral load testing or suboptimal viral load levels

S. Riabokon[1], O. Samsonova[1], L. Hetman[1]
[1]Public Health Center of the Ministry of Health of Ukraine, department of HIV management and counteraction, Kyiv, Ukraine

Background: A differentiated, patient-centered approach is crucial in the management of PLHIV, particularly in cases where patients miss routine VL testing or present with suboptimal VL levels. Missed appointments and suboptimal adherence to ART increase the risk of virologic failure and the development of drug resistance.
Addressing these challenges requires tailored interventions that consider for individual patient needs, ensuring continuity of care and sustained viral suppression.
Description: This study examines the diverse reasons behind the absence of virological suppression and missed VL testing within the past 12 months, among all PLHIV on ART on 01 January 2025 in Ukraine. Each patient group presents unique challenges that necessitate targeted interventions, which vary depending on the underlying causes. A range of personalized follow-up strategies, including telehealth consultations, peer support programs, and flexible service delivery models, can help re-engage patients in care and support their treatment adherence. Source of the data: National Information System of Socially Significant Diseases (IS MSSD).



Lessons learned: The implementation of a one-size-fits-all approach at the healthcare facility (HCF) level has proven ineffective in addressing the complexities of missed VL testing and suboptimal suppression. Failure to adopt a patient-centered approach may lead to:

- An increased risk of ART resistance due to prolonged periods of low-level viremia.
- Escalating healthcare costs associated with advanced treatment needs and complications.
- Deteriorating health outcomes and reduced quality of life for patients due to persistent viral replication.

Conclusions/Next steps: A differentiated, patient-centered approach should be incorporated into national HIV programs to enhance retention in care and improve treatment adherence.
Key strategies, such as individualized adherence counseling, community-based follow-up mechanisms, mobile blood testing services, flexible appointment scheduling, and telehealth consultations, are crucial for ensuring timely VL monitoring and achieving optimal treatment outcomes. Investing in these interventions will help reduce the burden on healthcare systems and improve the overall well-being of PLHIV.

EP0905

Adaptation of interventions to improve engagement and participation in HIV care interventions: lessons learned from the E2i initiative

D.R.A. Coelho[1], H. Goldhammer[2], N.S. Chavis[3], D. Psihopaidas[3], K.H. Mayer[2,4,5], A.S. Keuroghlian[1,2]
[1]Massachusetts General Hospital, Harvard Medical School, Boston, United States, [2]The Fenway Institute, Fenway Health, Boston, United States, [3]HIV/AIDS Bureau, Health Resources and Services Administration, Rockville, United States, [4]Harvard T.H. Chan School of Public Health, Boston, United States, [5]Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, United States

Background: *Using Evidence-Informed Interventions to Improve HIV Health Outcomes among People Living with HIV* (E2i) was a U.S. initiative to improve HIV care engagement, retention, and viral suppression among people with complex needs.
A primary E2i objective was to disseminate lessons learned about the influence of local context on the translation of research into practice. E2i was funded by the U.S. Department of Health and Human Services, Health Resources and Services Administration, under grant number U90HA42153.
Description: E2i (2017-2021) selected 11 interventions to pilot, adapt, and evaluate using an implementation science framework. Participating sites included 26 community-based organizations, health centers, and hospital-based clinics providing care to people with HIV in urban and rural settings across the U.S. Barriers and adaptations were qualitatively evaluated based on site staff interviews, and observation of technical assistance provision and peer-to-peer learning.
Lessons learned: During implementation, site staff reported key barriers that prevented eligible participants from starting or fully engaging in interventions. Barriers included medical mistrust, stigma, readiness for change, health literacy gaps, unmet subsistence needs, forgetting appointments, and mobile phone access challenges. Site adaptations to address barriers included hiring peers, providing tailored incentives, and offering flexible scheduling (Table 1).
When replicating interventions in real-world HIV settings, implementers should anticipate engagement barriers and plan to tailor adaptations for local communities.
Conclusions/Next steps: HIV interventions cannot produce beneficial outcomes if barriers prevent participation. E2i findings highlight the importance of local adaptations to engage participants.
Future implementation science research can further uncover effective strategies for improving intervention participation.

Barriers to participation	Adaptations to improve participation
Medical mistrust	• Incorporated peers as mentors, navigators, or co-facilitators. • Trained staff to build trust and prepare clients for sensitive discussions. • Allocated extra time during initial intervention sessions to establish trust.
Unmet subsistence needs	• Integrated case management into intervention, if not already intrinsic to the program. • Partnered with essential service providers through formalized agreements. • Offered tailored incentives, such as meals, grocery vouchers, pillboxes, and backpacks.
Structural barriers	• Provided bus passes, gas cards, and ride services. • Scheduled intervention sessions alongside other site appointments to reduce travel. • Delivered care via mobile health vans and at off-site locations (e.g., homes, parks). • Offered flexible scheduling, including evening/weekend hours and drop-in formats.
HIV stigma	• Avoided using "HIV" in recruitment materials, intervention names, and staff titles. • Opened interventions to clients regardless of HIV status to avoid disclosure. • Ensured privacy with telehealth options, off-site visits, and discrete entry points.
Stigma associated with mental health and substance use disorders	• Allowed clients to disclose sensitive information at their own pace. • Offered options to write responses in one-to-one interventions. • Used neutral, wellness-oriented language (e.g., "coaching" instead of "therapy"). • Delivered buprenorphine treatment at home to ensure privacy.
Readiness for behavioral change	• Paced interventions based on client readiness. • Conducted regular follow-ups to maintain communication and offer reassurance. • Used motivational interviewing to explore ambivalence and define goals.
Health literacy	• Provided pre-intervention sessions and extended time during sessions to clarify complex concepts. • Enhanced materials with multimedia tools (e.g., videos, apps, interactive formats). • Replaced written psychosocial assessments with orally administered versions.
Forgetting to attend sessions	• Sent reminders via text, calls, or automated systems. • Encouraged peer-led group chats for reminders. • Regularly updated client contact information.
Mobile phone challenges	• Secured funding to replace lost or stolen devices. • Provided mobile hotspots to ensure reliable internet access for virtual sessions and app-based tools.

Table 1. Barriers to client participation and adaptations implemented in E2i HIV interventions.

EP0906

Implementation determinants and strategies to implement an adapted Data to Care vertical HIV prevention intervention in South Africa

Y. Gomba[1], L. Knight[2,3], L. Myer[1], T.K. Phillips[1]

[1]University of Cape Town, Division of Epidemiology and Biostatistics, School of Public Health, Cape Town, South Africa, [2]University of Cape Town, Division of Social and Behavioural Sciences, School of Public Health, Cape Town, South Africa, [3]University of Western Cape, School of Public Health, Cape Town, South Africa

Background: Retention of mother-infant pairs (MIPs) in vertical HIV transmission prevention (VTP) is crucial for the mother's sustained viral suppression, to prevent HIV transmission, and for rapid diagnosis and treatment in the event of transmission. The REMInD intervention aimed to combine the benefits of a Data to Care (D2C) approach leveraging the Western Cape Provincial Health Data Centre data with telephonic tracing to support MIPs in completing VTP care. We conducted an implementation evaluation of the proof-of-concept study to identify implementation determinants and potential strategies to address these.

Methods: We conducted semi-structured in-depth interviews with 40 healthcare seekers, healthcare workers (HCW) and policy implementers from the REMInD study clinics in Gugulethu, South Africa. Interview transcripts were analysed using Thematic analysis guided by the Consolidated Framework of Implementation Research (CFIR) and the Expert Recommendations for Implementing Change (ERIC) frameworks. The CFIR-ERIC matching tool was used to complement and enhance the identification and description of strategies identified in the interview data.

Results: Implementation determinants identified for the REMInD intervention included the availability of human resources, electronic devices, power supply and physical space.

Additionally, the capabilities of those implementing the intervention, the perceived difficulty of the intervention, the geographical features of the community and HIV related stigma in the community were highlighted as potential implementation determinants.

Strategies to overcome barriers or leverage facilitators included giving HCW equal access to the intervention, identifying a 'champion' among HCW to drive implementation, providing ongoing consultation and training, adapting the intervention to suit the social and geographical context and using existing non-governmental partners for implementation support.

Conclusions: Using the CFIR, ERIC and CFIR-ERIC matching tool we identified key factors and selected strategies to address determinants and support successful implementation. Implementation success for the REMInD intervention, and similar D2C interventions in low resource settings, depends on addressing multiple interconnected factors.

These factors need to be accounted for in intervention design and at various stages of implementation, to enable the implementation of D2C interventions and improve HIV care and retention in low resource settings.

EP0907

Exploring the relationship between biometric matching outcomes and retention amongst key populations living with HIV

C. Obi[1], O. Fajemisin[1], E. Umechukwu[1], A. Salihu[1], A. Idemudia[2], C. Obiora-Okafor[2], C. Nwadike[2], M. Katbi[3], M. Morka[4]

[1]Society for family Health, Strategic Information, Abuja, Nigeria, [2]U.S. Agency for International Development, Strategic Information, Abuja, Nigeria, [3]U.S. Agency for International Development, Prevention and Community Programs, Abuja, Nigeria, [4]National AIDS and STDs Control Programme, Strategic Information, Abuja, Nigeria

Background: In Northern Nigeria, USAID implements the Key Population Community HIV Services Action and Response project (KPCARE 2). Due to the trans-location characteristics of key populations, this study investigated relationships between key populations' ART status and biometric uptake for effective service delivery.

Methods: The dataset was for clients enrolled on ART between 2020 - 2024 included variables such as current ART status, age, sex, health facilities, and biometric matching. Descriptive analysis, cross-tabulations, and chi-square tests were conducted using encoded Stata Variables. Demographic data, healthcare facilities, and biometric matching outcomes were cross-tabulated. Chi-square tests assessed the statistical significance of emerging patterns. PLHIV retention rates and biometric matching outcomes were compared to see if biometric matches correlated with higher retention.

Results: Data for a total of 53,786 KP-PLHIV were analyzed, out of which 43,346 clients were found active. Of the 43,346 active persons, 34,590 (79.8%) had matched biometrics, 2,672 (6.2%) had unmatched records, and 6,084 (14.0%) were newly enrolled with baseline biometrics only.

Retention rates were significantly higher in PLHIV with matched biometrics (91.3%, p <0.001) compared to unmatched (63.5%) or baseline-only biometrics (58.8%).

People aged 20-49 years with high matching outcomes had high retention in care, while those aged under 15 and over 49 years had lower biometric matching and retention. Females showed better matching and retention outcomes. Facilities with higher biometric matching success achieved greater retention of PLHIV. Biometric integration revealed that 10,440 inactive persons had discontinued care.

Conclusions: The study reveals a strong association and demographic groups with higher matching outcomes had better retention in care, emphasizing the critical role of effective biometric systems in PLHIV management for equitable healthcare delivery.

EP0908

Stated preferences for antiretroviral therapy (ART) adherence support and models of HIV care among South African adults starting or restarting ART: findings from two discrete choice experiments (DCEs)

M. Zondo[1], T. Phillips[1], B. Solinjani[1], P. Sele[1], H. Geffen[1], B. Chi[2], L. Knight[1], L. Myer[1]

[1]University of Cape Town, Epidemiology and Biostatistics, Cape Town, South Africa, [2]University of North Carolina at Chapel Hill, Department of Obstetrics and Gynecology and Department of Epidemiology, Chapel Hill, United States

Background: Evidence-based ART adherence support and differentiated models of care (DMOC) can be optimized by expanding eligibility and incorporating client preferences. We conducted two DCEs to elicit attribute preferences for these strategies in Cape Town, South Africa.

Methods: We enrolled 330 adults living with HIV at two peri-urban clinics (June–November 2024) who had newly started ART or restarted after an interruption (>3 months) in the last 6 months. Each client responded to 12 choice sets: six focused on attributes of adherence support and six on DMOC.

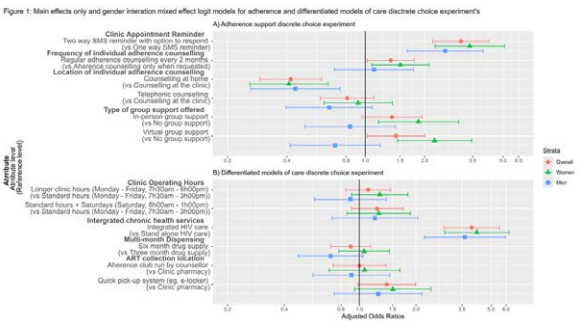
Mixed effects logit models, presented as odds ratios (OR) with 95% confidence intervals (CI), were used to estimate the relative preferences for each attribute level overall and by gender.

Random effects were included to estimate the standard deviations for all attribute levels, accounting for and identifying between-person preference heterogeneity.

Results: Overall, 235 (71.2%) participants were restarting ART, 130 (38.8%) were male (median age 41 years; interquartile range [IQR] 35–49) and 200 (61.2%) were female (median age 37; IQR: 30-41). Relative preferences are shown in Figure 1.

In the adherence support DCE (A), participants preferred a two-way appointment reminder (OR 3.1, 95%CI: 2.2–4.2), and had a negative preference for home-based counselling (OR: 0.4, 95%CI: 0.3–0.6).

Women, but not men, preferred group support (either in-person [OR: 1.9, 95%CI: 1.2-3.0] or virtually [OR: 2.2, 95%CI: 1.5-3.5]). In the DMOC DCE (B), participants only preferred receiving integrated HIV care (OR: 3.9, 95% CI: 2.8–5.5), with no differences by gender. Standard deviations for all attribute levels, except clinic hours, showed statistically significant heterogeneity in between-person preferences.



Conclusions: Two-way appointment reminders and integrated health services emerged as important service attributes overall. Gender differences and heterogeneity in client preferences suggest that individual choice may be needed to achieve optimal ART engagement.

EP0909

Earlier first viral load accelerates differentiated service delivery enrolment for people newly initiated on antiretroviral therapy: a retrospective analysis of 2023 HIV guideline implementation in South Africa

K. Rees[1,2], B. Mugisa[3], N. Davies[1], C. O'Connor[1], L.S. Wilkinson[4,5]

[1]Anova Health Institute, Johannesburg, South Africa, [2]University of the Witwatersrand, Department of Community Health, School of Public Health, Johannesburg, South Africa, [3]USAID, Pretoria, South Africa, [4]International AIDS Society, Geneva, Switzerland, [5]University of Cape Town, Centre for Infectious Epidemiology and Research, Cape Town, South Africa

Background: In April 2023, the South African National Department of Health updated antiretroviral therapy (ART) guidelines, advancing the first viral load (VL) test for ART initiators from six to three months post-initiation. Suppressed (VL<50 copies/ml) clients became eligible for less-intensive differentiated service delivery (DSD) models at their four-month result review.

We evaluated early adoption of the new VL schedule and its impact on DSD enrolment timing in four South African districts.

Methods: We analyzed ART initiations from January 2017 to December 2023, excluding those recorded as deceased, transferred out or with a baseline VL (suggesting prior treatment and/or potential re-engagement) but including those who may have disengaged during follow-up.

A follow-up period of 168 days (6x28 day dispensing cycles) was applied following guideline-mandated first VL timing. Trends in VL coverage, VL timing and DSD enrolment timing are described. A Cox proportional hazards model, restricted to 2023 post-April initiators, evaluated time to DSD enrolment adjusting for age, gender, district and time to first VL.

Results: We included 664,523 ART initiations, of which 57% (380,262) had a captured VL. Median time to first VL decreased from 177 days in 2022 to 119 days in 2023. Median time to DSD enrolment decreased 42% from 2022 to 2023 (Table 1).

Following the 2023 VL timing guideline shift, clients with a supressed three-month VL had a shorter median time to DSD enrolment (162 days) compared to those with a six-month VL (252 days; aHR=0.44; p-value <0.01, 95%CI 0.40;0.47).

Conclusions: The guideline shift to earlier VL testing was swiftly implemented, rapidly reducing time to DSD enrolment. Prioritizing first VL testing three months post-ART initiation, enables earlier access to less-intensive DSD models and targeted adherence support, critical to addressing retention challenges during the first year of ART.

Category	2017	2018	2019	2020	2021	2022	2023
Total ART initiations	131,006	110,573	123,876	91,798	76,463	69,653	61,154
VL not captured in follow-up period (includes disengaged individuals) (%)	61,097 (46.6%)	51,111 (46.2%)	56,349 (45.5%)	40,356 (44.0%)	31,321 (41.0%)	25,689 (36.9%)	18,356 (30.0%)
Median time to first VL (days, IQR)	180 (157-201)	179 (150-200)	181 (157-199)	179 (147-200)	176 (142-197)	177 (148-198)	119 (87-178)

EP0910

From long queues to timely care: the role of community-led monitoring in enhancing HIV services at Mikolongwe Health Centre in Thyolo District, Malawi

D. Mwagomba[1]

[1]Malawi Network of Aids Services Organisation, Programms, Lilongwe, Malawi

Background: Long wait times at Mikolongwe Health Centre made it hard for people to get HIV testing services because of staff shortages. By using Community Led Monitoring (CLM) practices to collect data and push for changes, staff became better organized, reduced wait times, and improved HIV testing and treatment.

This study shows how important community advocacy is in improving HIV prevention, treatment, and care services.

Description: Sixty-five (65) in-depth interviews with people living with HIV (PLHIV) and other recipients of care were conducted in July 2023 at the local health centre. Likewise, five focus group discussions were held with PLHIV, women, persons from key populations (KPs), as well as adolescent girls and young women (AGYW).

Lessons learned: CLM identified inadequate staffing as the root cause for the long waiting times observed by clients. The facility had one HIV Diagnostic Assistant (HDA) providing HIV testing, counselling, and viral load services. . The feedback was shared with the implementing partner, Malawi Counselling and Resource Organisation (MACRO) during a September 2023 advocacy meeting. In December 2023, MACRO deployed an additional HIV Diagnostic Assistant (HDA) and Treatment Supporter to the facility. CLM data revealed a significant reduction in client waiting times, with both clients and facility leadership acknowledging the improvements. Clinical data also showed improved testing of HIV services by 101% in FY4Q1, 118% in FY4Q2, and 122% in FY4Q3 and a reduction of ROC waiting time from 2 hours in FY3Q4 to 47 minutes on average in FY4Q3.

Conclusions/Next steps: CLM advocacy identified staff shortages as the root cause for long waiting times for HIV services at a local health center. MACRO, the designated implementing partner, deployed additional staff, resulting in significant improvements of client waiting times for HIV services and enhanced overall quality of care.
The findings and results suggest that targeted staffing interventions can bring a positive impact on the quality of HIV services.

EP0911

Two decades of experience with anti-retroviral therapy scale-up in Rwanda (2004-2024): enablers, strategies, and impact

G. Mujawamariya[1], A. Taofeek Tope[2], E. Remera[1], G. N Rwibasira[1], C.M. Muvunyi[1]
[1]Rwanda Biomedical Centre, Kigali, Rwanda, [2]University of Rwanda, Kigali, Rwanda

Background: Over the past 20 years, Rwanda has made significant progress in scaling up antiretroviral therapy (ART), achieving near-universal coverage for people living with HIV (PLHIV).
From 2004, with ART coverage below 10%, the country reached 97% ART coverage by 2024, drastically reducing HIV-related mortality by 82%. This progress is attributed to strong political leadership, commitment to equity, and collaborative efforts.
The objective of this analysis is to explore how these enablers contributed to ART scale-up, the effectiveness of the interventions, and the specific impacts on different gender identities, age groups, and geographic regions.
Description: Key enablers and strategic interventions of Rwanda's ART scale-up include:
1. Strong political leadership prioritized HIV/AIDS in national health strategies, mobilizing resources to integrate ART into the healthcare system.
2. Decentralization of services extended ART to all levels of the health service delivery, ensuring access in remote areas.
3. Task-shifting and community engagement empowered nurses and community health workers (CHWs) to deliver ART and monitor adherence, improving retention and reducing stigma.
4. Partnerships and funding from global partners like the Global Fund and PEPFAR provided essential technical and financial support for ART implementation.
5. Integration of ART services into essential services like maternal and child health, tuberculosis, and primary care, facilitating service uptake.
6. Innovation and technology through differentiated care models and electronic health records improved patient-centered care and efficiency.
Lessons learned: From 2004 to 2024, Rwanda's ART coverage grew from below 10% to 97%, reducing mortality by 82%.
These gains were attributed to targeted testing, early treatment initiation, and retention strategies, which were implemented across diverse demographic groups, including women, youth, and vulnerable populations.
Key lessons include the importance of community engagement in overcoming stigma and the role of task shifting in improving access.
Conclusions/Next steps: Rwanda's ART scale-up demonstrates that strong political commitment, community involvement, and innovation are key to achieving significant health outcomes. Moving forward, continued investment in equitable access, particularly in underserved populations, and addressing gender-based disparities and ensuring sustainable quality service delivery will be essential to maintaining and expanding these gains.

EP0912

Increased retention in care among persons with HIV receiving health facility-based HIV care outside of normal working hours in central Mozambique: a retrospective cohort study (2021-2024)

C. De Schacht[1], C. Cabsela[1], Z. Yu[2], I. Gaspar[3], C. Belo[1], C. Lucas[1], I. Nobre[3], E. Graves[4], G. Amorim[2], J. Tique[1], C. Wester[5]
[1]Centro pela Saúde Global (C-Saúde), Maputo, Mozambique, [2]Vanderbilt University Medical Center, Department of Biostatistics, Nashville, United States, [3]Ministry of Health, National Directorate of Public Health, Maputo, Mozambique, [4]Vanderbilt Institute for Global Health, Nashville, United States, [5]Vanderbilt University Medical Center, Department of Medicine, Nashville, United States

Background: To enhance uptake and retention in HIV care, a differentiated service delivery (DSD) model offering extended working hours (EWH) is being implemented in Mozambique, providing services until 8pm on weekdays and on Saturday mornings.
We assessed the effect on 12-month retention in care, lost to follow-up (LTFU), and viral suppression among persons with HIV (PWH) utilizing EWH, compared to those receiving care only during regular working hours (RWH).
Methods: We analyzed routinely collected individual-level data for PWH (≥15 years old) receiving care from July 2021 to June 2024 at 12 health facilities in Zambézia Province. RWH clients were matched to EWH clients (2:1 ratio) on time on antiretroviral therapy (ART), age, sex, and location. Mixed-effects logistic models were built to assess the effect of EWH on 12-month retention and viral suppression, and mixed-effects Cox models were used for LTFU. PWH were classified as retained in care if they had an ART pick-up <60 days after their last scheduled pick-up.
Otherwise, they were LTFU. PWH were classified as virologically suppressed if their HIV viral load count was ≤1,000 copies/mL within one year of EWH eligibility.
Results: Among 61,521 PWH (20,507 EWH; 41,014 RWH) included, 65% were female and mean age was 31 years (standard deviation=8). The 12-month retention rates were 91% and 81% for EWH and RWH clients, respectively. Compared to RWH clients, EWH clients had 2.46 the odds of being retained at 12 months (95%CI:2.30–2.63; p<0.001). LTFU was lower among EWH compared to RWH clients (33% vs 45%; HR:0.64; 95%CI:0.62-0.66; p<0.001). Viral sup-

pression rates were 91% and 92% for EWH and RWH clients, respectively (OR:0.86; 95%CI: 0.75-0.99; p=0.03). Similar effects were seen among males and females (Table).

	Extended Working Hours (%)	Regular Working Hours (%)	Effect size	p-value
12-month retention (n= 42879)			Odds Ratio (95% CI)	
Overall	91%	81%	2.46 (2.30-2.63)	p<0.001
Male	90%	79%	2.59 (2.34-2.88)	p<0.001
Female	92%	82%	2.38 (2.19-2.59)	p<0.001
Lost to follow-up (n= 61521)			Hazard Ratio (95% CI)	
Overall	33%	45%	0.64 (0.62-0.66)	p<0.001
Male	38%	51%	0.63 (0.60-0.65)	p<0.001
Female	31%	42%	0.65 (0.63-0.67)	p<0.001
HIV Viral Suppression (n=12154)			Odds Ratio (95% CI)	
Overall	91%	92%	0.86 (0.75-0.99)	p=0.03
Male	91%	92%	0.87 (0.68-1.12)	p=0.28
Female	91%	93%	0.86 (0.73-1.02)	p=0.08

Table. Effect of Extended Working Hours model on 12-month retention, lost to follow-up and viral suppression (overall and disaggregated by sex).

Conclusions: Our evaluation found favorable continuum of care outcomes for male and female PWH utilizing flexible clinic hours in Mozambique. This client-centered DSD is an effective strategy at enhancing PWH engagement and retention in HIV care. These findings provide insights for potential model expansion in collaboration with local policymakers.

EP0913

Review of advanced HIV disease management practices in inpatient and outpatient settings: insights from Nakuru and Kericho counties, Kenya

J. Mungai[1], J. Nyaliech[2], R. Kiuna[3], W. Eigege[4], N. Mngadi[5]

[1]Clinton Health Access Initiative, Infectious Diseases, Nairobi, Kenya, [2]Ministry of Health, Kenya, Regional Technical Working Group, Eldoret, Kenya, [3]Ministry of Health, Nakuru County, County AIDS and STI coordinator, Nakuru, Kenya, [4]Clinton Health Access Initiative, Advanced HIV Disease, Abuja, Nigeria, [5]Clinton Health Access Initiative, Advanced HIV Disease, Nairobi, Kenya

Background: In Kenya, approximately 30% of newly diagnosed people living with HIV (PLHIV), 21% re-engaging in care, and 27% experiencing treatment failure present with advanced HIV disease (AHD), increasing their mortality risk. To address this, Nakuru and Kericho counties each designated four health facilities as AHD Centers of Excellence (CoEs) under the Ministry of Health's comprehensive AHD framework. The County Health Management Teams (CHMTs) aimed to assess facility-level care processes in inpatient departments (IPDs) and HIV and tuberculosis (TB) outpatient clinics to identify strengths and gaps in AHD management.

Description: Between August and October 2024, Kericho and Nakuru CHMTs, with support from the National AIDS and STI Control Program (NASCOP), Regional Technical Working Groups, Clinton Health Access Initiative, and AfroCAB, conducted facility visits and reviews of AHD patient records in CoEs. The activities included IPD visits, reviews of charts for AHD patients attending HIV and TB clinics, and multidisciplinary team meetings to discuss AHD cases and mortalities.

These discussions provided recommendations to improve AHD management. Qualitative observations during IPD visits, chart reviews, and team meetings revealed critical areas for improvement in AHD care.

Lessons learned: Both inpatient and outpatient settings demonstrated strong leadership, dedicated staff, and robust CHMT and partner support. Facilities were well-equipped with diagnostic tools like GeneXpert and AI-assisted chest X-rays, but notable gaps remained. These included inadequate screening, diagnosis, and management of AHD, particularly for paediatric opportunistic infections (OIs) and CD4-based diagnosis.

Inpatient wards lacked clinical algorithms for AHD management, faced erratic supplies of commodities for OIs, and experienced weak coordination between IPDs and HIV clinics, hindering care continuity. Uptake of TB preventive therapy among eligible clients was suboptimal (~30%). Mentorship and supervision efforts were largely focused on HIV and TB outpatient clinics, with minimal attention to IPDs.

Conclusions/Next steps: The review highlighted critical gaps in AHD diagnostics, especially in the consistent application of CD4 and OI testing algorithms.

Addressing these requires enhanced training, adherence to standardized protocols, and improved cross-departmental collaboration to strengthen AHD management and ensure better patient outcomes.

EP0914

Improving the disclosure rate among adolescents living with HIV through integrating a quality improvement approach within the Zvandiri model in South Africa and South Sudan

V. Trivella[1], A. Sellberg[2], B. Jabu[3], R. Chidora[2], P. Matyanga[2], C. Mandimika[2], J. Coombes[2], V. Chitiyo[2], N. Willis[2]

[1]Right to Care, Johannesburg, South Africa, [2]Zvandiri, Harare, Zimbabwe, [3]JHPIEGO-OVC activity, Juba, South Sudan

Background: Treatment and mental health outcomes of Adolescents Living with HIV (ALHIV) remain suboptimal, of which non-disclosure is a key factor. WHO recommend that children of school age be informed of their HIV status, but most countries are struggling to ensure this.

Zvandiri connects ALHIV with trained, mentored, peer counsellors called Community Adolescent Treatment Supports (CATS). Integrating quality improvement (QI) projects focusing on improving disclosure rates among ALHIV has been documented as a best practice within Zvandiri.

Description: South Africa (Right to Care) and South Sudan (JHPIEGO-OVC activity) have both adopted the Zvandiri model and are currently supporting 1044 and 600 ALHIV through 50 and 13 CATS respectively. Zvandiri supported both countries to set up QI projects September 2023 and August 2024 respectively, with a QI package consisting of;

- Health Care Workers (HCW) and CATS elucidating and documenting the disclosure status of supported ALHIV,
- CATS and HCWs providing disclosure support to ALHIV who were not fully disclosed to including caregiver support meetings and CATS-led pre- and post- disclosure counselling sessions.

Lessons learned: The proportion of ALHIV that had received full disclosure in South Africa and South Sudan increased from 51% (533/1044) and 52% (59/113) to 82% (852/1044) and 74% (84/113) respectively as a total of 192 and 33 ALHIV and their caregivers received the QI package of disclosure support.

The main success factors were development of support groups for beneficiaries and caregivers to support the disclosure process and reducing the average age of disclosure. The main challenges were lack of responsibility taken by caregivers to support their child's care and treatment and lack of mental health support integrated within HIV programmes.

However, CATS sharing of lived experiences was helpful in engaging support structures within families and supporting the mental health of the ALHIV.

Conclusions/Next steps: This initiative has demonstrated that using a QI approach integrated within the Zvandiri model including documentation of disclosure status and active follow up of ALHIV in need of disclosure support is a scalable and cost-effective means to improve disclosure rates.

There is need for governments to adopt this strategy at scale to ensure improved disclosure rates among ALHIV across the region.

EP0915

Quality improvement initiatives in HIV service delivery: bridging gaps in recipient of care centred HIV care in Zimbabwe, 2024

E. Govha[1], T. Apollo[1], C. Mupanguri[1], C. Gwanzura[1], N. Muzungu[1], B. Muhlwa[1], J. Mabuku[1], C. Mbito[1], T. Matare[1], S. Chipuka[1]

[1]Ministry of Health and Child Care, AIDS and TB Programs, Harare, Zimbabwe

Background: Differentiated Service Delivery (DSD) is a Recipient of Care (RoC)-centred approach that simplifies and adapts HIV services to clients' preferences while reducing health system burdens. Since 2017, Zimbabwe has implemented DSD models for antiretroviral therapy (ART), with annual reviews conducted since 2018. The 2024 DSD review, conducted across 148 facilities in 30 districts from four provinces, reviewed implementation progress of quality improvement (QI) initiatives and successes within HIV service provision.

Description: Since 2022, healthcare workers (HCW) have been trained in QI using a standardized training package, along with coaching, mentorship and participation in ECHO sessions. Implementation required facilities to form QI teams, conduct root cause analysis, generate solutions and implement.

We collected and analyzed data from 4,630 records using Survey CTO and PowerBI, focusing on ART cohorts at 12, 24, and 36 months. Key data elements included DSD model utilization, availability of QI teams, and plans, provision of coaching and mentorship, viral load testing and suppression, and community involvement in quality service provision.

Lessons learned: The implementation of QI in healthcare facilities has significantly improved program performance. Sixty-three percent of facilities have multidisciplinary QI teams that review performance indicators and implement solutions. Despite RoC remaining in conventional care, 96% of facilities have QI standards specific to less intensive DSD models, including viral load testing, drug refills, and clinical visits. There has been a notable improvement in annual viral load testing (84%) and suppression (96%).

Over 95% of facilities have received coaching and mentorship visits, improving RoC records management, identification systems and integration through review dates synchronisation for various services. ECHO sessions provided a cheap and efficient way of HCW capacitation and peer learning on QI implementation.

Most facilities are collaborating with the community for service quality improvement. However, only 33% of facilities have satisfaction surveys for healthcare workers.

Conclusions/Next steps: Quality improvement initiatives in healthcare facilities demonstrated significant successes, including improved program performance, through enhanced multidisciplinary QI teams, and plans. HCW should enhance RoC awareness and engagement in DSD models, increase QI plans documentation, prioritize HCW satisfaction surveys, continue coaching and mentorship through ECHO sessions, and expand community involvement in quality service provision.

EP0916

Optimizing pediatric ART with DTG-10mg based regimen in public hospitals in Liberia

B. Gibson[1], A. Forleh[2], J. Flomo[2], S. Conteh[2], N. Wordsworth[2], S. Sow[2], G. Bondo[2], W. Fassah[2], A. Sie[2], M. Dahn[1], G.M. Jackson[2], M. Tegli[1]

[1]Plan International, HIV /TB Program, Monrovia, Liberia, [2]National AIDS Control Program, HIV, Sinkor, Liberia

Background: In Liberia, we face persistent challenges in diagnosing and treating children living with HIV, an estimated 4,000 children living with HIV (Spectrum 2022). Among children under 14 years on antiretroviral therapy (ART), 90% were on a regimen of ABC/3TC/LPV/r, achieving an average viral suppression rate of only 70%. Poor adherence to this regimen, due to administration difficulties and adverse events, threatens the viability of second-line options for eligible children.

Recognizing the potential WHO-recommended dolutegravir (DTG) 10 mg regimen to improve outcomes, we embarked on scaling up its use in public health facilities across Liberia. This regimen has demonstrated superior treatment outcomes, regardless of prior exposure to non-nucleoside reverse transcriptase inhibitor (NNRTI) or protease inhibitor (PI)-based regimens. We share our experience at scaling up the use of DTG-10mg in public health facilities in Liberia.

Methods: We collaborated with key stakeholders to form a national multidisciplinary team focused on improving pediatric ART. Together, we advocated for and sensitized county health offices, developed a pediatric ART training manual and dosing wheel, and trained all ART providers in participating facilities. We also appointed expert clients do to follow up on mother-baby pairs and conducted monthly program performance reviews, led by facility ART coordinators, to monitor and improve implementation.

Results: (2021)

Sex	Age Group	Number on ART Before Transition	Number Transitioned to DTG-10 mg	Number Achieving Viral Suppression (DTG-10mg)	Viral Suppression Rate (%)
Male	<5 years	21	20	20	100%
Female	<5 years	38	36	36	100%
Male	5-14 years	356	356	354	99%
Female	5-14 years	485	484	480	99%

Conclusions: Despite the diagnostic and treatment challenges we face, we successfully transitioned the majority of children on ART to the WHO-recommended DTG 10 mg regimen. Our efforts resulted in 99.3% of these children achieving viral suppression within six months, a significant improvement over the 70% suppression rate with the previous regimen.

This success underscores the value of strong stakeholder collaboration, capacity building, and rigorous program monitoring. Through these efforts, we continue to strengthen the care and treatment of children living with HIV in Liberia.

EP0917

An audit of antiretroviral regimens in people living with HIV attending a sexual health clinic in Sydney's Inner West in response to the REPRIEVE study

R. Burdon[1], M. Weerasinghe[1], L. Garton[1]
[1]Sydney Local Health District, Department of Sexual Health and HIV Medicine, Camperdown, Australia

Background: Current or previous use of the antiretroviral drug (ARV) abacavir has been shown to be associated with increased risk of major adverse cardiovascular events (MACE) in people living with HIV (PLWH). We conducted an audit of ARV regimens prescribed to PLWH attending Royal Prince Alfred Sexual Health (RPASH) to identify individuals receiving abacavir with view to optimise treatment.

Methods: All PLWH attending RPASH between December 2023 and December 2024 were included. Records were retrospectively analysed for gender, age, duration of HIV infection, latest HIV-1 viral load and current antiretroviral regimen. PLWH whose antiretroviral regimen included abacavir were flagged for treatment review with view to remove abacavir.

Results: 370 PLWH were included in the analysis. 91% were male (n=338). Median age was 46 years (IQR:38-55) and median duration of HIV infection was 9 years (IQR:5-13). Most (96%) were virally suppressed (defined as HIV-1 viral load < 200 copies/mL). The most common ARV regimen was bictegravir/tenofovir alafenamide/emtricitabine (n=167) followed by dolutegravir/lamivudine (n=115), dolutegravir and tenofovir alafenamide/emtricitabine (n=35), dolutegravir/abacavir/lamivudine (n=21) and long acting cabotegravir/rilpivirine (n=17). 24 PLWH were receiving abacavir therapy. As of January 2025, 33% (n=8) of PLWH receiving abacavir containing regimes had abacavir deprescribed with all being switched to dolutegravir/lamivudine. 29% (n=7) declined to change from their abacavir containing therapy, 4% (n=1) had complex resistance and co-morbidities complicating the deprescribing and the remaining 33% (n=8) are either planning to change from an abacavir containing regime in 2025 or are yet to attend an appointment where this has been discussed.

Conclusions: This audit demonstrates the need to track and systematically review ARV regimes of PLWH to modernize treatment regimens and proactively prevent co-morbidities, particularly MACE.

Further study is required to examine why some PLWH are reluctant to change therapy and to explore patient focused strategies to ensure HIV treatment and co-morbidity prevention and care are optimized.

EP0918

Assessing ART clients' experience of a novel person-centred care model piloted in eight rural and peri-urban public clinics in South Africa

A. Jim[1], L. Rambally-Greener[2], H. Ngubane[1], S. Malone[2]
[1]Population Services International (PSI), HIV/TB, Durban, South Africa, [2]Population Services International (PSI), HIV/TB, Johannesburg, South Africa

Background: Designed and piloted from January 2023 to September 2024 in eight rural and peri-urban public clinics in South Africa, the Ngiyakuzwa person-centred care model employed nurse-mentors to provide weekly on-the-job training, coaching and mentoring as a means of strengthening providers' empathy, communication skills, teamwork, stress management, and supportive supervision, hypothesizing that providers who felt better-supported would provide better-quality care to clients.

Methods: We conducted clinic exit surveys with 456 ART clients at baseline, mid-pilot, and endline, and in-depth interviews with 42 ART clients mid-pilot to assess their experience of care. Survey data were charted over time for identification of potential trends. Interviews were recorded, transcribed, and analysed thematically.

Results: Survey data reflected improvement in providers making clients feel welcome and comfortable, communicating clearly, asking questions, listening carefully, and respecting privacy.

Survey responses (n=456 per round, % agreeing or strongly agreeing)	Baseline	Endline
Did the nurse make you feel welcome and comfortable?	90%	99%
Did the nurse use words you could easily understand?	87%	100%
Did the nurse ask about how you are feeling today?	77%	94%
Did the nurse explain what they would be doing today before starting?	77%	94%
Did the nurse ask if you had any questions or concerns?	57%	96%
Did the nurse listen carefully to what you said?	82%	99%
Was your privacy respected during your visit?	81%	98%
Did the nurse ask you if you have any difficulties taking your medication?	51%	91%
Did the nurse explain your blood results in a way that was clear to you?	45%	96%

In-depth interviews provided further insights into clients' experience of care:

"We were not treated very nice in those days. I don't want to lie. Now things are going well... Like today they were educating us. In other clinics they would say that thing is a waste of time."

"It's better here at the clinic now because if you miss the appointment, they talk with you in a good manner."

"They used to shout at us, and if you ask for your file, they won't entertain you, but now it's better. If you ask for your file, they give you attention."

"I felt welcomed and important. We treated each other well. They talked well with me, and I also talked well with them."

Conclusions: Both survey data and in-depth interviews showed positive shifts in clients' perceptions of quality of care, suggesting that person-centred care approaches can contribute to improvement in client experience. These findings highlight the potential value of integrating PCC approaches into public health strategies and programs.

EP0919

Strengthening the implementation of individual patient tracking sheet to improve continuity in HIV care in Nkurenkuru District, Namibia

H. Amukwaya[1], S. Nuunyango[1], M. Sahani[2], T. Danda[1], M. Said[1], P. Kalimugogo[3], N. Forster[1]

[1]International Training and Education Center for Health (I-TECH) Namibia, Windhoek, Namibia, [2]Ministry of Health and Social Services, Windhoek, Namibia, [3]Centers for Disease Control and Prevention, Division of Global Health and TB, Windhoek, Namibia

Background: In July 2022, Namibia launched the Standard Operating Procedure (SOP) for Tracing and Post-tracing Activities for Clients Receiving Anti-Retroviral Treatment (ART). A key tool included in the SOP is the use of individual patient tracking sheet booklets to improve the retention rate for clients on ART. In December 2023, Namibia's Nkurenkuru District reported a retention rate of 90.7%, which was below the national target of 95%.

A quality improvement (QI) project was undertaken to identify factors contributing to suboptimal performance and to improve retention in HIV care in Nkurenkuru District.

Description: A district QI team employed a root cause analysis to assess factors contributing to poor implementation of the individual patient tracking sheet and inform the selection of change ideas. Change ideas implemented included in-service training and one-on-one coaching to healthcare providers (HCPs), establishing a clear reporting system, developing a standardized data collection tool, and strengthening collaboration with community-based service providers. Change ideas were initially rolled out in January 2024 across five health facilities and then across the remaining 9 health facilities in the district in May 2024. Routine data from the electronic client monitoring system were used to measure retention in HIV care, defined as the proportion of ART clients active in care among all clients on ART. District-level retention in HIV care was analyzed and monitored monthly from December 2023 through July 2024.

Lessons learned: Over the initial roll-out period, district-level HIV retention rate improved from 90.7% (4350/4796) in December 2023 to 94.6% (4436/4688) in April 2024. After change ideas were implemented across all district facilities, the retention rate further improved from 94.8% (4419/4659) in May 2024 to 95.2% (4428/4654) in July 2024.

Conclusions/Next steps: The QI project resulted in improved implementation of the Tracing and Post-Tracing Activities SOP and improved HIV retention among PLHIV in Nkurenkuru District. Addressing knowledge gaps, establishing clear reporting processes, and providing adequate supervision can support improvements in retention in HIV care.

EP0920

Interventions supporting disclosure among children and adolescents living with HIV: a scoping review and realist analysis

C. Laurenzi[1], W. Ameyan[2]

[1]Stellenbosch University, Institute for Life Course Health Research, Department of Global Health, Tygerberg, South Africa, [2]World Health Organization, Geneva, Switzerland

Background: Disclosure of HIV status remains a critical gap for children and adolescents, and is key to enhancing prevention, care, and treatment outcomes. Effective disclosure support needs to recognize children's and adolescents' evolving capacity for decision-making about their own health, their individual circumstances, their social support networks, and risks that may follow disclosure. However, global guidance has lagged for this group; the most recent child HIV disclosure guidelines from WHO are from 2011.

This scoping review and realist analysis aimed to identify existing interventions supporting child and adolescent disclosure since 2011 to support future guidance in this area.

Methods: A scoping review was conducted to identify interventions supporting HIV status disclosure to, and by, children and adolescents living with HIV. Evaluations using randomized controlled trial designs, as well as quasi-experimental, observational, and qualitative methods, were included.

We analyzed relevant interventions in two distinct ways. Disclosure-specific interventions, focused on disclosure of status as a common outcome or target, were analyzed using realist approaches to identify what works, for whom, in what circumstances. Broader interventions, which we termed disclosure-inclusive, were analyzed narratively.

Results: Disclosure-specific interventions (n=11) were typically targeted towards caregiver-child pairs, often including health providers. Realist analysis of disclosure-specific interventions generated three overarching themes, embedded in an overarching model: recognizing autonomy and dignity, enhancing engagement, and components linked to environment.

Strategies that promoted capacity among caregivers, enhanced opportunities for client engagement, and were developmentally appropriate led to better uptake and preparation for healthy disclosure. Disclosure-inclusive interventions (n=14) were more often focused on adolescents who knew their status, including onwards disclosure skills among other topics. Several interventions integrated multiple levels and sectors to enhance outcomes and improve child and adolescent environments.

Conclusions: Alongside these promising findings, we identified five emerging considerations for current and future disclosure interventions.

These include

1. Recognizing adolescent development and the evolving capacity for autonomous decision-making;
2. Addressing layered stigma and adopting rights-based approaches;
3. Enhancing measurement, monitoring, and evaluation; building support systems across families and communities, and
4). Integrating fluid approaches and innovation to an evolving epidemic. Key gaps and actions for each area will be presented.

EP0921

Enhancing retention and treatment uptake among adolescents interrupting HIV treatment in Nanyuki Teaching and Referral Hospital, Kenya

C. Maina[1], E. Wangari[1], P. Maina[1]
[1]Nanyuki District Hospital, Health, Nanyuki, Kenya

Background: Retaining adolescents living with HIV (ALHIV) on treatment programs and ensuring viral suppression is essential for achieving the 2030 HIV epidemic control targets. Treatment interruptions among ALHIV remain a significant barrier.

This study highlights the outcomes of incorporating structured interventions during appointment visits to improve retention and treatment uptake, with a focus on promoting the principles of "Undetectable Equals Untransmitable" (U=U).

Methods: High numbers of treatment interrupters, averaging 6 per quarter in 2022, posed a significant challenge to achieving retention goals. To address this challenge, a multidisciplinary approach was adopted, integrating a return-to-care package, enhanced adherence counseling, psychosocial support groups, and groups like Operation Triple Zero (OTZ).

These strategies were applied during scheduled appointment visits to re-engage adolescents, address barriers, and promote adherence. Metrics included retention rates, viral suppression, and qualitative feedback from participants.

Results: The number of treatment interrupters reduced by 50% from 2022 to 2024, reflecting improved retention and treatment uptake. Adolescents who returned to care reported increased understanding of U=U and greater motivation to adhere to treatment.

Enhanced adherence counseling and psychosocial support sessions addressed key barriers such as stigma and mental health challenges, while focus groups provided peer and team support.

Conclusions: Incorporating a return-to-care package and enhanced adherence counseling during scheduled visits, alongside psychosocial support and focus group interventions, significantly reduces treatment interruptions and improves retention and viral suppression among ALHIV.

This multidisciplinary model offers a scalable and effective strategy to address barriers and achieve sustainable outcomes in adolescent HIV care.

EP0922

Enhanced m-health mental health screening for adolescents living with HIV transitioning into adult care (EMMATAC Study)

N. Gitahi[1], S. Waruinge[2], A. Kiplagat[2], L. Atwoli[3], E.A. Bukusi[1]
[1]Kenya Medical Research Institute, Nairobi, Kenya, [2]Nairobi Metroplitan Services, Nairobi, Kenya, [3]The Aga Khan University, Brain and Mind Institute, Medical College East Africa, Nairobi, Kenya

Background: Growing evidence indicates that around half of all adolescents and young adults living with HIV experience mental health difficulties in Africa. The transition into adult care and psycho-social stressors may augment mental health illness symptoms and contribute to poor viral suppression. Despite this, less than 1% of adolescents and young adults living with HIV (AYALHIV) receive mental health screening as part of routine care in resource-limited settings that often have a scarcity of healthcare workers. Little is known about the determinants of mental health in this population.

The study investigates the feasibility, acceptability, and adaptability of a self-administered m-health-based mental health screening tool among 765 adolescents and young adults living with HIV in eight research sites in Nairobi County.

Methods: Between August 2022 and January 2023, we enrolled adolescents and young adults (AYA) aged 15-24 accessing care at eight clinics in Nairobi, Kenya. We excluded pregnant AYA, those without HIV disclosure, those with pre-existing mental health conditions, and those in acute stages of HIV (stage 3 or 4). Participants used a self-administered survey tool to screen for mental health issues, including General Anxiety Disorder (GAD-7), Depression (PHQ-9), Post-Traumatic Stress Disorder (PC-PTSD-5), and substance use (S2BI). We also evaluated the reach, feasibility, adaptability, and acceptability of the mental health routine screening.

Results: We enrolled 462 participants, 53.1% of whom were female, with a mean age of 19.2 years (SD 2.6). The mean age of HIV disclosure was 12.8 years (SD 3.4). PTSD

emerged as the most prevalent mental health condition (78%), followed by depression (40.4%) and generalized anxiety disorder (33.7%). Late HIV disclosure (after age 12) (p=0.01), ART treatment interruptions (p=0.009), and stigma (p=0.007) were independently associated with mental health conditions at 95% CI.

Participants rated the intervention's feasibility at 83% and its acceptability at 80%. Among participants, 88% expressed willingness to undergo screening again, with 61% preferring annual screenings.

Conclusions: This study successfully implemented self-screening for mental health among AYALHIV, achieving high feasibility and acceptance. The high prevalence of mental health conditions and strong participant support underline the importance of integrating routine mental health screening into HIV care.

EP0923

Tracing historical lost-to-follow-up lists: an intervention to find children living with HIV in rural South Africa

J. Turner[1], D. Makamu[2], C. Jackson[1], A. Madliwa[1], L. Ndhlovu[1], C. Chasela[1], C. Onaga[1], A. Schley[2]
[1]Right to Care, Nelspruit, South Africa, [2]mothers2mothers, Nelspruit, South Africa

Background: Ehlanzeni District is one of seven South African districts with the largest gap to achieving the second 95 target for children. Of the estimated 21,502 CLHIV, 8,826 are not in care. Despite a 30% increase in testing, the identification of new CLHIV remains low, necessitating alternative approaches. CLHIV in Ehlanzeni who miss appointments are routinely traced telephonically and/or physically.

If unsuccessful after 90 days, they are confirmed as lost-to-follow-up (LTFU). Right to Care (RTC) NPO partnered with community-based organization, mothers2mothers, to trace CLHIV in Ehlanzeni, historically categorized as LTFU, and link them to care.

Description: In June 2024, RTC generated historical LTFU lists for CLHIV (0–18 years) from 2019–2024 for 138 facilities in Ehlanzeni. Clients were telephonically traced; after three unsuccessful attempts, RTC engaged 52 mothers2mothers' peer educators to conduct home visits during July–September 2024.

Located clients were accompanied to clinics for re-initiation and connected with facility staff to ensure a closed referral loop. Outcomes of tracing efforts were documented and analyzed.

Lessons learned: Among 3,661 identified LTFU CLHIV: 1,193 (33%) were above 18 years old in 2024 and were not traced, 509 (14%) had no address, 358 (10%) were traced, and 1,601 (44%) are pending. Among the 358 traced, 52 (15%) were successfully re-linked to care, 102 (28%) were active at the same or a different clinic, 15 (4%) had relocated outside the district, 10 (3%) refused care, 2 (0.5%) were deceased, and 176 (49%) were not found.

Ideally, district-level electronic record searches should precede tracing to identify clients active at other facilities. Regularly updating contact details during clinic visits is crucial for improving trackability. Collaboration with community-based organizations is valuable and could be strengthened with a shared data collection system.

Conclusions/Next steps: Tracing 358 children and locating 52 was more resource-efficient compared to testing an estimated 13,000 children to identify 52 CLHIV (current positivity yield: 0.4%). We recommend enhancing this intervention (by developing a shared data collection system and searching district-level electronic records before tracing) and scaling it to other districts to improve treatment coverage among CLHIV.

EP0924

The role of group psychosocial support clinics in improving viral load suppression for children and adolescents living with HIV in Kigezi region

B. Namanya[1], D. Omadi[1], C. Akello Tiri[1], L. Mugumya Kabaja[1], L. Linda[1]
[1]Joint Clinical Research Centre, Programs, Kampala, Uganda

Background: Group Psychosocial Support clinics for HIV-positive children provide services to help cope with their unique challenges. This effort is one of JCRC LPHS Kigezi & Lango Activity's comprehensive approaches to provide a supportive environment for providing peer support, counselling, and education on medication adherence. By addressing emotional and mental health needs, involving family members, and offering tailored interventions, these clinics help adolescents manage their condition more effectively.

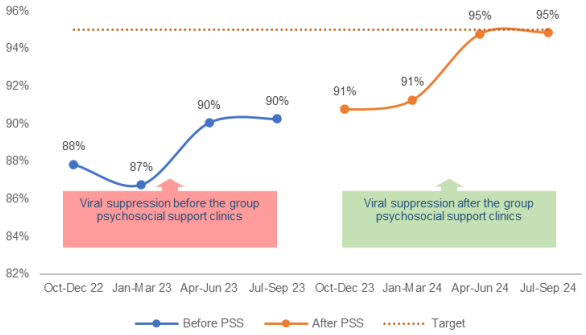
The initiative discussed was implemented to address viral suppression among children and adolescents following field results that showed; throughout 2023, the viral suppression for the children and adolescents 10 to 19 years averaged 89% falling short of the 95% UNAIDS target.

This was attributed to psychological, social, and economic barriers that affect adherence including; denial, fear, non-disclosure, stigma and discrimination, domestic violence, and lack of livelihood support for basics such as food. As a result, 20 health facilities were selected to pilot the group psychosocial support clinics with the aim of addressing the barriers identified from the root cause analysis undertaken.

Description: A stepwise approach was applied in implementation of the group psychosocial support clinics as follows.

- A root cause analysis was conducted to identify barriers to suppression.
- Trained and oriented the health workers on the provision of psychosocial support services and focal persons were identified
- Re-aligned appointments for adolescents to the designated adolescent clinic days with maximum of 30 adolescents was done. Sessions were categorized in two groups 10 – 14 and 15 – 19 to further discuss the topic(s) for the day.

Lessons learned: Suppression at the 20 health facilities improved from 90% in September 2023 to 95% in September 2024 realizing the 95% UNAIDS target.



Conclusions/Next steps: Leveraging group psychosocial support clinics to improving adherence to ART and providing holistic care is critical to achieving viral suppression and enhancing the quality of life for the adolescents.

EP0925

Closing the final gap to U = U: disparity between PLWH with and without undetectable viral load

C.-W. Li[1,2], S.W.-W. Ku[3,4], P. Huang[5], T.-T. Chuang[2], H.-J. Wu[6], T.-H. Wu[4], A. Bourne[7,6], C. Strong[2]

[1]National Cheng Kung University Hospital, Tainan, Taiwan, Province of China, [2]National Cheng Kung University, Tainan, Taiwan, Province of China, [3]Taipei City Hospital Renai Branch, Taipei, Taiwan, Province of China, [4]HIV Education And Research Taiwan (HEART) Association, Taipei, Taiwan, Province of China, [5]National Taiwan University, Taipei, Taiwan, Province of China, [6]Kirby Institute, Sydney, Australia, [7]La Trobe University, Melbourne, Australia

Background: By 2023, Taiwan has achieved the UNAIDS 2030 goals of "91-96-95", outperforming many countries. However, the social and demographic factors regarding why and how people living with HIV (PLWH) have not yet achieved undetectable viral load (UVL) have not been fully addressed yet in the literature.

Methods: A survey comprising 65 questions was administered online to adult GBMSM using social networking applications in Taiwan from November to December 2023. Basic demographics, HIV serostatus, sexual behaviors (e.g., numbers of sexual partners, condomless anal intercourse, self-reported sexually transmitted infections and conducts of chemsex), and preventive behaviors (e.g., doxy-PEP, mpox vaccine, and HPV vaccine) were collected. If the respondent reported positive HIV status, whether UVL has achieved was further asked.

Results: A total of 1,664 responses were completed and 328 (12.3%) who reported positive HIV serostatus were included in this study. Amongst, 309 (93.9) out of 328 have achieved UVL, while 19 (6.1%) reported detectable viral load. The mean age of PLWH without UVL was 33.1-year-old (SD 6.1), which was significantly younger than those with UVL (37-year-old, SD 7.7, p=0.041).

In univariable analysis, higher proportion of PLWH without UVL reported to have monthly income less than 45,000 New Taiwan Dollar than those with UVL (p=0.038), while PLWH without UVL reported more conducts of chemsex than PLWH with UVL (p=0.012). There was a significantly lower proportion of PLWH without UVL completing 2-dose mpox vaccine than PLWH with UVL (36.8% vs. 61.2%, p=0.043). Multivariable logistic regression showed PLWH without UVL conducted more chemsex (aOR: 2.89, 95% CI 1.09-7.75), and less completed 2-dose mpox vaccine (aOR: 0.36 95% CI 0.13-0.95).

PLWH without UVL vs PLWH with UVL	Univariable		Multivariable	
	OR (95% CI)	p-value	aOR (95% CI)	p-value
Sociodemographics				
Age (years old) (> 35 vs. ≦35)	0.31 (0.10-0.83)	0.028	0.35 (0.11-0.98)	0.058
Monthly Income (≧$45000NTD vs. <45000NTD)*	0.27 (0.06-0.82)	0.038	0.32 (0.07-1.01)	0.078
Sexual behaviors				
Numbers of male sexual partners in the last 12 months (≧6 vs. <6)	0.68 (0.22-1.84)	0.477		
CLAI in past 3 months (Yes vs. no)	1.74 (0.61-6.23)	0.335		
Self-reported STI in the lifetime (any kind vs. no)	1.53 (0.52-4.07)			
Chemsex for the past 3 months (Yes vs. no)	3.35 (1.30-8.72)	0.012	2.89 (1.09-7.75)	0.032
Preventive Behaviors				
Had Doxy-PEP use experience (Yes vs. no)	1.17 (0.06-6.33)	0.885		
Had Mpox Vaccination experience (vaccinated vs. unvaccinated/incomplete vaccinated)	0.37 (0.13-0.95)	0.043	0.36 (0.13-0.95)	0.044
Had HPV Vaccination experience (vaccinated vs. unvaccinated/incomplete vaccinated)	0.15 (0.01-0.76)	0.071		

PLWH: people living with HIV; UVL: undetectable viral load; CLAI: condomless anal intercourse; STI: sexually-transmitted infection; *$45,000NTD=$1,400USD

Conclusions: The study finds out that disparity between PLWH without and with UVL still exists, including the adoption of certain preventive strategies. Therefore, providing differentiated care services to improve health outcome among those in need is essential.

EP0926

Innovative proactive client appointment scheduling system to ameliorate congestion and improve continuity in HIV treatment in high volume facilities in Zambia

A. Tesfay[1], H. Fomundam[2], S. Mushipe[1], H. Nyambi[1], D. Kaoma[3], K. Chitiya[3]

[1]Howard University, Howard University Global Initiative, South Africa (HUGISA), Pretoria, South Africa, [2]Howard University, Howard University Global Initiative South Africa, Pretoria, South Africa, [3]Howard University International Zambia, Lusaka, Zambia

Background: The rollout of universal access to antiretroviral treatment (ART) has significantly improved HIV prevention, reduced morbidity, mortality and contributed to epidemic control. The increasing demand for ART services has stretched healthcare infrastructure in Zambia, leading to overcrowding, long waiting times, and compromised quality of care. To address these challenges, Howard University's Differentiated Service Delivery-plus (DSD-plus) model was introduced and implemented.

This client-centered, proactive appointment scheduling system emphasized on appointments by date and time, appointment reminders, color coded cards and benches to optimize service delivery, reduce waiting times, improve client satisfaction, and ensure continuity in treatment.

The objective of this intervention was to optimize service delivery, reduce client waiting time, improve appointment adherence, client satisfaction, and continuity of ART care.

Methods: We assessed the impact of the proactive appointment scheduling system on waiting times and client satisfaction in 30 DSD-plus clinics, serving 131,760 ART clients from 2018 to 2024. We categorized clients into three

groups based on appointment adherence: green for on-time, yellow for early/late, and red for missed appointments. Clients received corresponding coloured-cards and benches, prioritizing those adhering to schedules. Longitudinal data analysis compared pre- and post-intervention outcomes, examining changes in waiting times, adherence to appointments, and client satisfaction over time.

Results: Intervention data showed significant improvements:

- Waiting times reduced from ≥4 hours to ≤45 minutes.
- Adherence to appointment increased from 50% to 96%.
- Client satisfaction improved from 50% to 99%.
- Concordance between appointment scheduling and attendance reached 100%.

Conclusions: The proactive appointment scheduling system effectively improved continuity in care for ART clients. By involving clients in appointment scheduling and rewarding on-time attendance; the intervention enhanced client satisfaction, reduced waiting times, and improved ART adherence. This approach is essential for sustaining long-term HIV treatment and highlights the importance of considering client preferences in healthcare decisions. Scaling-up and integration of such models are crucial for successful DSD interventions in Zambia and similar contexts.

This project was funded by the Health Resources and Services Administration (HRSA) under the U.S. President's Emergency Plan for AIDS Relief, as part of the Historically Black Colleges and Universities (HBCU) Global Health Consortium (GHC) Initiative.

EP0927

Empowering HIV acceptance and disclosure through a peer-led, group based mental health Intervention, Sauti ya Vijana (SYV), for adolescents and young adults living with HIV (AYALWH) in Tanzania

E. Ketangenyi[1], E. Senkoro[2], D. Mayaya[1], N. Martine[1], J. Gallis[3], D. Dow[3,4,2]

[1]Baylor College of Medicine Children's Foundation, Tanzania, Program Research, Mwanza, Tanzania, the United Republic of, [2]Kilimanjaro Christian Medical Center-Duke Collaboration, Program Research, Moshi, Tanzania, the United Republic of, [3]Duke Global Health Institute, Durham, United States, [4]Duke University, Department of Pediatrics, Durham, United States

Background: Adolescents and young adults living with HIV (AYALWH) often struggle to accept their HIV diagnosis and fear disclosing to others. This can impact their mental health, adherence to antiretroviral therapy (ART), and viral suppression. These abstract reports disclosure patterns of AYALWH enrolled in the Sauti ya Vijana (SYV, the Voice of Youth) intervention and experiences practicing HIV disclosure in the SYV intervention.

Methods: SYV is a peer-led, group-based mental health and life skills intervention for individuals aged 10-24 years who:

1. Are aware of their status,
2. Attend HIV clinic,
3. Receive ART for at least six months, and;
4. Are willing and cognitively able to participate in group sessions.

Enrollment occurred March 2023 – July 2024 (follow-up is ongoing). Disclosure is a topic woven throughout SYV.

The cognitive behavioral therapy trauma narrative, uses a timeline help youth talk about memories; when they learned they live with HIV, and how they were before, after, and now. Youth practice telling their memory first in an individual session with a group leader; then sharing of the memory in the group; and finally their caregiver who knows their status, but listens to the memory of what the experience was like for the youth.

Disclosure information from the enrollment questionnaire along with session notes (AYALWH randomized to intervention arm) were reviewed for participation and thematic content analysis.

Results: Among the 690 participants, 84% (579) reported that their HIV status was intentionally disclosed to them, primarily by a family member (51%) or a healthcare provider (43%). In contrast, only 20% of youth reported intentionally disclosing their HIV status to someone else. Among the 248 sexually active participants, 42% (104) have disclosed their status to their sexual partner.

Of the 235 participants randomized to attend SYV sessions (intervention), 84% (197) attended the individual session, while 12% (206) were unable to attend the group session. Additionally, 75% (149/200) of caregivers participated in the sharing session.

Conclusions: Few AYALWH have intentionally disclosed their status to others. Peer-led interventions like SYV can help AYALWH practice disclosure safely by sharing their memory, practicing role plays, and considering steps of disclosure.

EP0928

Addressing barriers to continuity of HIV treatment in three health facilities in Ghana through root cause analysis and quality improvement initiatives

W. Kwarah[1], E.E. Houphouet[1], E. Sullivan[2], H. Robinson[1], E. Essandoh[1]

[1]USAID, Health, Population, and Nutrition Office, Accra, Ghana, [2]USAID, Health, Population, and Nutrition, Accra, Ghana

Background: In Ghana, interruptions in treatment (IIT) present a significant challenge for achieving sustained viral suppression. We implemented a Root Cause Analysis (RCA) across three healthcare facilities with the highest IIT rates to identify and manage the factors influencing treatment interruption.

Methods: In June 2023, we used the five-whys technique[1] to interview 77 purposely-selected clients who returned to care after interrupting treatment in three health facilities in the Western region, the largest PEPFAR-supported region in Ghana. These sites had high treatment interruption cases. The main outcome of interest was the reason(s) for interrupting treatment. We used Microsoft

Excel to compile and analyze the data. Based on the initial analysis, we developed and delivered differentiated service delivery (DSD) approaches to improve treatment retention across these health facilities. We conducted follow-up qualitative interviews with a new set of clients at 6 months to assess any changes in the reasons for interrupting treatment.

Results: The majority of clients interviewed were female (64.6%), single (48.0%), self-employed (63.6%), living in an urban area (81.8%), and have secondary education (40.2%). The median age was 37 years (IQR: 18-61 years). The key causes of interruption were related to logistical challenges, including long travel distances to facilities (28.6%), lack of time for appointments (20.8%), and high costs associated with travel and receiving care (11.7%). Some clients interrupted treatment due to religious beliefs (13.0%) or stigma and discrimination (5.2%). Adverse treatment effects or health concerns were rarely indicated as a principal reason, with 3.9% delaying due to illness and 1.3% due to treatment issues. After delivering targeted DSD interventions including community ARV delivery, motivational counselling, education, and community engagement, 76.3% (261) clients returned to care within six months, of which a third (80) had anti-retrovirals delivered through home deliveries or other public transport systems. The number of clients reporting religious belief as a reason for interrupting care decreased by 50 percentage points.

Conclusions: These findings illustrate the effectiveness of root cause analysis-driven interventions in addressing treatment interruption and improving treatment continuity. This initiative highlights the value of structured problem analysis and tailored interventions in addressing treatment challenges, offering insights for developing client-centered care.

EP0929

Enhanced adherence counseling in the dolutegravir era: survey of current practice in PEPFAR programs

N. Aitcheson[1], S. Lloyd[2], S. Hong[2], M. Tejan[2], J. Fatima da Silva[2]

[1]Centers for Disease Control, Division of Global HIV and TB, Atlanta, United States, [2]Centers for Disease Control, Atlanta, United States

Background: Viral load non-suppression (VLNS) on dolutegravir (DTG)-based antiretroviral therapy is more often due to inadequate adherence than drug resistance. World Health Organization guidelines recommend enhanced adherence counseling (EAC) for all individuals with VLNS, but EAC practices differ between countries. To improve adherence support across PEPFAR supported programs, we surveyed countries about their current EAC implementation, resources, and perceived needs for program improvement.

Methods: Thirty-one CDC country office teams were surveyed in March 2024 via a 25 item semi-structured form. Quantitative data were analyzed descriptively, and free-response data were analyzed thematically using modified grounded theory.

Results: The majority (22/31) of countries responded. Indications for EAC ranged from VL 50-1000 (median 1000, IQR 50-1000). EAC session length ranged from 5 to 60 minutes (median 16-30, IQR 5-15 to 31-60 minutes). Most countries (17/22) conducted 3 sessions prior to rechecking VL.

Only 10 reported that completing the sessions was the only requirement met before rechecking viral load—the majority specified that the counselor must believe that adherence has improved. EAC was provided in mostly clinical locations (21/22) though 9/22 programs offered phone or telemedicine EAC.

Lay counselors, nurses, clinicians, and expert clients provided EAC—few (3/22) countries reported having professional counselors available. Most (16/22) countries reported an individualized assessment of barriers for each client; 3/22 countries reported measuring client satisfaction with counseling.

All programs (22/22) relied on client self-report as the primary adherence measure, with 18 using additional measures (e.g. pill counts, pharmacy pick-up). No countries used point of care drug levels during counseling.

Additional resources like case management, mental health support, and socio-economic support were variable. Respondents noted opportunities to decrease travel burden to clinic, increase client self-efficacy, and improve access to mental health, substance use, and economic insecurity support.

Conclusions: Optimizing person-centered adherence services for clients with VLNS may aid in closing the viral suppression gap. We found heterogeneity in indication, length, location, cadre delivering EAC, and criteria for re-checking viral load, as well as structural barriers to care amenable to intervention. Development of these complementary services to support adherence may maximize the impact of potent DTG-based therapies.

EP0931

Addressing advanced HIV disease: strategies to reduce AIDS mortality in Brazil

T.H. Nascimento[1], M. Vieira Freire[1], A.P. Moura da Silva[1], R. Campos Hallal[1], J.D. Urbaez Brito[1], L. Gomes Neta[1], C.A. de Albuquerque Almeida Junior[1], A.R. Pati Pascom[1], I. Ornelas Pereira[1], P.R. Abrao Ferreira[2], R.N. Barbosa Nadler[1], D. Barreira Cravo Neto[1]

[1]Ministério da Saúde do Brasil, Brasília, Brazil, [2]Universidade Federal de São Paulo, São Paulo, Brazil

Background: In Brazil, around 1 million people are living with HIV (PLHIV). In 2024, 25% of PLHIV were diagnosed with advanced disease, with the possibility of a worse outcome. The Ministry of Health has therefore implemented the Advanced HIV Disease (AHD) response strategy, with the aim of rapidly diagnosing and treating opportunistic diseases and reducing AIDS mortality.

This study aims to describe the results of implementing the AHD response strategy in 2023 and 2024.

Methods: This is a descriptive study based on the implementation of the AHD response strategy between June 2023 and November 2024 in 22 cities in five Brazilian states. The AHD response strategy offers a package

of care that includes rapid testing: immunochromatographic CD4, urine lipoarabinomannan (LAM), urine histoplasma antigen (HistoAg) and cryptococcal antigen (CrAg), in addition to prioritizing the care of PLHIV with advanced disease in health services, linkage strategies, initiation of antiretroviral therapy (ART), treatments and prevention of tuberculosis and cryptococcosis.

Results: The AHD response strategy covered 5,094 PLHIV. The sociodemographic profile showed high social vulnerability: 58% brown, 21% gay or men who have sex with men, 42% aged between 25 and 39 and 39% had up to 7 years of schooling. Of the total number of people, 33% were located through reengagement strategies.

As for the tests, 3,711 people (73%) underwent LAM, 27% of whom were reactive. Of the total number of reactive, 63% PLHIV had no respiratory symptoms; 3,578 underwent CrAg (4% were reactive) and 1,597 underwent HistoAg, 16% of whom were reactive. Of those who had an indication, 61% underwent prophylaxis with sufamethoxazole-trimethoprim. Of the 3,749 people who started ART, 44% started within 7 days of diagnosis, as recommended in the national clinical protocol.

Conclusions: The strategy of responding to advanced HIV disease has been consolidated as a fundamental tool for tackling AIDS mortality in Brazil, by rapidly diagnosing and treating the main opportunistic diseases.

This approach reinforces the importance of access to comprehensive care to improve the quality of life of PLHIV, consolidating advances in the response to the epidemic.

EP0932

Transforming HIV care: reducing stigma and enhancing U=U communication through community engagement and creative interventions

H.S. Toh[1], C.-H. Tsai[2], H.-Y. Liang[3], H.-C. Ku[3], H.-C. Wang[3], G.-Y. Chen[3], T.-H. Cheng[3], H.-M. Chen[4], C.-N. Kung[3], Z.-Y. Chen[4], C.-T. Liao[5], H.-J. Tang[2]

[1]Chi Mei Medical Center, Center for Quality Management, Tainan City, Taiwan, Province of China, [2]Chi Mei Medical Center, Department of Infectious Diseases, Tainan City, Taiwan, Province of China, [3]Chi Mei Medical Center, Infection Control Center, Tainan City, Taiwan, Province of China, [4]Chi Mei Medical Center, Department of Nursing, Tainan City, Taiwan, Province of China, [5]Chi Mei Medical Center, Medical Education Center, Tainan City, Taiwan, Province of China

Background: This programme aimed to enhance HIV care at Chi Mei Medical Center in southern Taiwan by addressing stigma as a barrier to treatment and promoting U=U communication. Targeting healthcare providers across departments, it focused on education, creative engagement, advocacy, and community collaboration to increase U=U awareness, reduce stigma-related behaviors, foster person-centered care, and ensure sustainable improvements in HIV treatment delivery.

Description: From March to December 2024, the project applied the HEALTHQUAL QIS+D framework to improve medical friendliness among healthcare providers. Using quality control circle (QCC) methods, key interventions included:

- **Educational Reform:** Multi-disciplinary training and testimonials from PLHIV to build knowledge and empathy.
- **Creative Engagement:** Hosting "Friendly Healthcare Day" in the hospital, featuring stigma-reduction activities such as role-playing games, workshops, and a drag queen performance to challenge stereotypes.
- **Community Collaboration:** Partnering with NGOs to bridge gaps between healthcare providers and communities, strengthening U=U communication.
- **Advocacy:** Disseminating educational videos and conducting flash campaigns across hospital units to promote behavioral change.

Lessons learned: The programme achieved significant improvements. U=U awareness increased from 15.1% to 24.6%, psychological stress during blood draws decreased from 42.1% to 12.8%, and discrimination reports fell from 14.8% to 8.7%. The hospital's viral suppression rate reached 98% in 2024, surpassing Taiwan's national average of 96%, underscoring the impact of integrating stigma reduction into HIV care.

Integrated strategies combining education, creative engagement, and advocacy proved effective. Testimonials from PLHIV fostered empathy, while clear U=U communication enhanced understanding and reduced misconceptions. Challenges such as scheduling conflicts highlighted the need for flexible interventions, including e-learning modules.

Conclusions/Next steps: This initiative underscores the importance of U=U communication, community engagement, and innovative education in reducing stigma and improving HIV care. Creative interventions, such as the drag queen performance, and collaboration with NGOs fostered empathy and inclusivity. Future plans include scaling these strategies to regional hospitals and integrating digital tools to sustain impact. This programme offers a replicable model for advancing stigma-free, equitable HIV care globally.

EP0933

The impact of partner support in driving differentiated service delivery implementation in Zimbabwe: insights from technical assisted and non-technical assisted districts

C. Gwanzura[1], T. Apollo[1], C. Mupanguri[1], E. Govha[1], J. Mabuku[1], T. Matare[1], T. Nyamundaya[2], M. Ndlovu[2], E. Tachiwenyika[2]

[1]Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, [2]Zimbabwe Health Interventions (ZHI), HIV Care and Treatment, Harare, Zimbabwe

Background: Zimbabwe started implementing differentiated service delivery (DSD) models for ART (DART) in 2017 and has been conducting DSD reviews annually since 2018. The DSD reviews assess implementation progress and provide peer-learning opportunities to share best practices, challenges, and innovations. The 2024 DSD Review was conducted in July – August 2024.

Description: One hundred and forty-eight facilities in 31 districts from four provinces participated. Twenty-one (21) districts have additional support from United States President's Emergency Plan for AIDS Relief (PEPFAR) supported partners. Data was collected using Survey CTO and analysed using PowerBI generating frequencies and proportions. A facility survey and individual client survey tool were used. Data was abstracted from 4,630 files for recipients of care (RoCs) in the 12-, 24-, and 36-month cohorts on antiretroviral therapy (ART). Data was collected for services received from HIV testing to treatment outcomes, viral load monitoring, and integration with TB, and non-HIV services. We compared selected outcomes between the PEPFAR-supported districts and those without PEPFAR support (non–PEPFAR supported).

Lessons learned: PEPFAR-supported sites had lost to follow-up (LFTU) rates of 8% for 12months cohort, 11% for 24 months cohort, and 9% for 36 months cohorts whilst in non-PEPFAR supported sites LFTU rates were 16%, 20%, and 25% respectively. The conditional modified HIV cascade of Active on ART- Received Viral Load Test –Suppressed Viral Load was 76% - 71% - 97% for the 12-month cohort in PEPFAR-supported sites versus 75% - 50% - 97% in non–PEPFAR sites. Similar trend was seen for the 24-month and 36-month cohorts.

Conclusions/Next steps: PEPFAR-supported sites had superior retention compared to non-PEPFAR-supported sites, largely because of the additional staff, technical assistance, ICT gadgets, and airtime they received. The same is provided to the non–PEPFAR–supported districts but not to the same extent. The findings showed that these differences in support have an impact on the quality of services provided. Sustainability plans must identify critical support services that must remain to ensure maintenance of quality service provision.

EP0934

Improving viral suppression among children living with HIV in CMMB-Haiti network

R. Mesidor[1], M. Jeanniton[1], V. Cassagnol[1], Y. Louis[1], K. Cure[2], D. Jean-Francois[1]

[1]Catholic Medical Mission Board, Ouest, Port-au-Prince, Haiti, [2]Catholic Medical Mission Board, New York, United States

Background: Viral suppression (VS) among children remains widely suboptimal at 46%, and only 73% of CLHIV maintain VS over 3 years. Haiti's pediatric guidelines mandate a standard care package comprising enhanced counseling for caregivers and medical evaluation for children with a VL <1000 copies/ml. Because CLHIV VS remains low, CMMB's ALESIDA2 introduced an "optimized care package" children in 22 healthcare institutions. Pediatric VS rose to 88% in September 2023 among 920 CLHIV active in care. This research investigated how our package contributed to that success.

Methods: The optimized package adds at least one other targeted intervention (e.g., directly observed therapy or DOT; HIV status disclosure for preteens; VL class) to the standard package.

A mixed methods approach was used. A cohort analysis used secondary patient-level data, extracting quantitative data from EMR and site-level pediatric registers for unsuppressed HIV-positive children under 15 who had received care between October 2022–September 2023 in ALESIDA2-network clinics. A qualitative component involved semi-structured interviews with 11 providers, analyzed using directed, conventional, and summative content analysis approaches.

Results: The analysis included 125 unsuppressed CLHIV (43.2%F, 56.8%M; 52.80% aged 10-14; 68% rural; 92.8% without comorbidities). Of caregivers, 73.6% were biological parents, 20.8% other family members. 12% of the study group received the standard package, 88% the optimized package. Only 60% of standard package recipients were suppressed at study conclusion, compared to 85.45% of optimized package beneficiaries. 84.48% of children on DOT became undetectable by year-end, 76.1% of other participants. 81.33% of those taking at least one VL class became suppressed, 77.92% of those receiving individual counselling. 81.58% of preteens initiating disclosure became suppressed, 79.31% of others.

The research supports provider confidence in the optimized package. Respondents praising the optimized package highlighted DOT and VL class effectiveness and described disclosure challenges.

Conclusions: The ALESIDA2 optimized care package has shown significantly higher VS among initially unsuppressed CLHIV compared to standard care. Success stories, general revelations about improved VS, and positive caregiver reactions—elicited in interviews—highlighted the optimized package's impact. Interventions emphasizing group interactions, adherence reinforcement, and patient engagement in care are key to improve viral suppression toward epidemic control.

EP0935

High viral load suppression after implementation of an asset-based strategy - "Operation Triple Zero" - for children, adolescents and young people on ART in four health facilities of South Sudan

G. Jagwer[1], L.J. Gunde[1], J.M. Lurit[1], J. George[1], S.B. Tombe[1], T. Yombo[1]
[1]Catholic Medical Mission Board, HIV/AIDS, Juba, South Sudan

Background: Amid a severe humanitarian crisis, South Sudan remains committed to a 95% viral coverage (VLC) and suppression (VLS) among people on ART. Adolescents/young people receiving ART experience lower rates of VLC/VLS delaying the achievement of the UNAIDS target if not addressed. It is critical children achieve sustained VLS to mitigate the exceptionally high mortality associated with unsuccessful HIV treatment. To address low VLC/VLS rates among children, the "Operation Triple Zero" (OTZ) program was implemented by the Catholic Medical Mission Board (CMMB).
Description: Between October 2023 and September 2024, 425 children aged 10 – 24 years on ART were enrolled into the OTZ program in four public facilities. The program is an asset-based strategy that aims at engaging children on ART to promote "zero missed appointments", "zero missed drugs" and "zero viral load". Key activities include VL eligibility assessment; routine and enhanced adherence counselling for participant, drug refills, role play and games, treatment literacy sessions, and sessions with caregivers. Data from the program was abstracted and analyzed for VLC and VLS after enrollment in the program.
Lessons learned: Out of the 425 clients enrolled in the program, 90 were eligible for viral load testing and 62 had their viral load samples collected, representing an overall VLC of 74%. Out of 67 whose viral load samples were collected 93% (range 93%-100%) achieved VLS; of these 51% were female and 49% male. All are on a DTG based regimen. All the children enrolled at Al Sabah Children's hospital suppressed their viral load. All the targeted clients continue with active engagement in the OTZ program to sustain the VLS.
Conclusions/Next steps: We describe the OTZ program to inform strategic interventions to reach the "third 95" among children. Children enrolled in the OTZ program had high VLS rates as compared to the lower averages among other children in South Sudan. As we move towards having 95% of ART-treated children achieve and maintain VLS, there is need to scale up similar programs for all children on ART with focus on inculcating children's self and social awareness, self-management, relationship management and responsible decision making among children on ART.

EP0936

Empowering youth to combat HIV stigma: a peer-led, human-centered approach to U=U awareness

P. Mashigo[1], T.M. Ndhlovu[2], C. Moyo[2], M. Malahlela[2], N. Tshuma[2]
[1]Ga Rankuwa YMCA, Community Based Organisation, Tshwane, South Africa, [2]Best Health Solutions, Public Health, Johannesburg, South Africa

Background: HIV-related stigma and misinformation remain significant barriers to open dialogue, testing, and treatment adherence among adolescents and young people. Despite advancements in treatment, misconceptions about HIV transmission, particularly around the concept of U=U (Undetectable = Untransmittable), persist. This peer-led initiative aimed to increase understanding and acceptance of U=U through relatable, youth-centered storytelling and digital engagement, addressing both awareness and stigma reduction within this demographic.
Description: The intervention employed human-centered design thinking and storytelling to co-create the "Soa Story," a digital animation disseminated via social media to convey the U=U message. A total of 37 adolescents and young people participated in the development process, ensuring cultural and contextual relevance. In addition to online storytelling, 41 key informant interviews and 9 focus group discussions were conducted to explore target group perceptions, uncover stigma-related myths, and collaboratively identify solutions. These interactive sessions allowed participants to actively engage with U=U messaging, fostering a safe environment for open discussion on HIV and sexual health.
Lessons learned: The intervention resulted in a 73% increase in knowledge of U=U among participants, with 85% reporting increased confidence in supporting peers living with HIV who are undetectable. Social media analytics revealed a 149% increase in engagement with U=U-related content, with over 10,239 interactions recorded across platforms. The "Soa Story" animation reached 51,691 views, sparking open discussions and inquiries on HIV misconceptions. However, persistent stigma and misinformation among certain sub-groups indicated the need for ongoing, adaptive messaging strategies.
Conclusions/Next steps: Involving adolescents and young people in message creation ensured that content was relatable, culturally relevant, and impactful. Human-centered design and storytelling proved effective in engaging youth, though challenges remain in countering deep-rooted stigma and myths. Social media provided a powerful platform for awareness but required consistent moderation to address misinformation. Scaling this model across other regions and integrating it with school-based programs could enhance impact and long-term sustainability.

EP0937

Improving delivery of the advanced HIV disease package of care through monthly low CD4 count file audits: an ongoing intervention in rural South Africa

J. Turner[1], C. Chasela[1], C. Onaga[1], S. Maunatlala[1], C. Jackson[1]
[1]Right to Care, Nelspruit, South Africa

Background: People living with Advanced HIV Disease (PLAHD) require a package of care to reduce morbidity and mortality. In South Africa, the absence of point-of-care CD4 testing often delays PLAHD identification and care. Right to Care NPO assessed management of PLAHD, in Ehlanzeni District, and intervened early where necessary.
Description: From July–October 2024, monthly file audits were conducted for PLAHD, in Ehlanzeni District, initiated on ART in the previous month with CD4 <200 cells/βL, identified using TIER.net. An Excel-based tool captured findings, and a specially designed job aid guided corrective actions. A retrospective secondary analysis of data was performed. Proportions were calculated for key demographic, clinical, and management indicators.
Lessons learned: Over four months, 1,021 (19%) PLAHD were identified from 5,286 new initiations across 138 facilities, and 661 (65%) files were audited. Most (85%) were aged 25–55 years, peaking at 35–39 years. More females were younger (<35 years) than males. All were initiated on ART; 84% started same-day (6% inappropriately). Nearly half (49%) had CD4 <100, and 28% had CD4 <50. Many gaps in care were identified. CrAg testing was documented for 97% (310) of eligible clients, with nine (3%) positive. Of these, eight were referred for lumbar puncture; four had no results, four had meningitis excluded, and six received fluconazole. TB screening was documented in 644 (99%); 22% were symptomatic, and 78% asymptomatic. TB-NAAT was performed for 511 (78%), with 56 (11%) positive. U-LAM testing was done for 182 (28%), with 45 (25%) positive. TPT was initiated in 534 (93%) of those eligible (80% at ART initiation), with 39 (7%) still needing to start. Cotrimoxazole was started in 423 (65%), while 35% still required it. Only 18% of women >15 years had a pap smear.. Of those with results, 63 (10%) had eGFR <50, 89 (27%) had haemoglobin<10g/dL, and 19 (5%) had hepatitis B.
Conclusions/Next steps: Specialized monthly file audits identified gaps in AHD care delivery, enabling early interventions for PLAHD, and targeted training at underperforming clinics. We recommend scaling up and continuing this approach until AHD management aligns with care standards.

EP0938

Updating PLHIV profile an essential tool in optimizing re-engagement in care

T. Adeleye[1], E. Nwabueze[1], E. Ijezie[1], L. Buzaalirwa[2], P. Iutung[2], G. Ojamuge[3], N. Dube[4]
[1]AIDS Healthcare Foundation, FCT Abuja, Nigeria, [2]AIDS Healthcare Foundation, Kampala, Uganda, [3]AIDS Healthcare Foundation, Kampala, Nigeria, [4]AIDS Healthcare Foundation, Manzini, Eswatini

Background: Client engagement is a dynamic state comprising retention in care, medication adherence and keeping clinical as well as laboratory appointments. Thus, client engagement is critical in achieving good health outcomes for PLHIV. AIDS Healthcare Foundation provides treatment for about 32,000 clients in Nigeria across 7 states, ensuring they are continuously engaged in care. Back in Care is an initiative to facilitate the re-engagement of clients who are No-Longer-in-Care for more than 12-months as part of efforts to achieve the UNAIDS 95-95-95 global goal.
Methods: Clients who are No-Longer-in-Care (NLIC) across 17 facilities in 7 states were line listed for tracking and re-engagement in care. Trackers, other service providers, including expert clients were trained and deployed to conduct client tracking. Phone and physical tracking approaches were adopted. Active tracking was conducted between August and December 2023. Clients unreachable through phone tracking were physically tracked to their homes using registered address.
Results: Of the 1754 NLIC clients, 73% were tracked by phone-calls. 41% were reached directly and 9% through their next-of-kin. Of the 50% not reached though phone tracking, 50% were tracked physically and 49% were reached. 43% of the total tracked physically and reached were re-engaged in care and 13% of clients tracked through phone either directly or next-of-kin and reached were re-engaged in care.
Conclusions: Client's contact details, next-of-kin and physical address should be validated at every clinical visit as this is essential to re-engagement in care when clients become NLIC. Also, client re-engagement in HIV care should be a continuous exercise. Clients who are NLIC should be periodically line-listed and scheduled for tracking to facilitate their re-engagement in care as this will improve quality of life of PLWH and prevent HIV transmission.

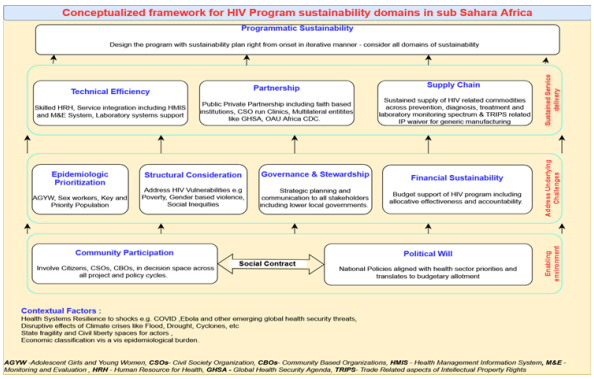
Global and national financing, economic evaluation and sustainability

EP0939

HIV program sustainability beyond external assistance in sub-Saharan Africa: a framework synthesis

A. Openy[1,2], J.M. Irige[3], A. Ssennyonjo[4], M. Bruno[1]
[1]Institute of Tropical Medicine, Public Health, Antwerp, Belgium, [2]University of Oulu, Centre for Environmental and Respiratory Health Research (CERH), Faculty of Medicine, Oulu, Finland, [3]The AIDS Support Organisation (TASO), Program and Capacity Development, Kampala, Uganda, [4]Makerere University School of Public Health, Department of Health Policy Planning and Management, Kampala, Uganda

Background: The global goal of ending HIV/AIDS as a public health threat by 2030 has driven significant investment with vivid progress in sub Saharan Africa; translating to human capital development. However, as external support declines, national governments face challenges sustaining these gains. Existing literature largely emphasizes financial sustainability, neglecting other critical domains. This study aims to develop a framework identifying evidence-based domains for sustaining HIV programs in SSA beyond financial aspects.
Methods: Scoping review and a "best fit" framework of evidence synthesis method was used. A database search for literature, guidelines, and policies on HIV program sustainability from PubMed, Web of Science, CABI Global Health, Medline, and Google Scholar for 10-year period (2014- 2024). Grey literature on sustainability from HIV program related organizations were included. A total of 33 research publications and 7 policy documents on sustainability were reviewed. Through a deductive approach, an 'a priori framework' was identified for concurrent analysis of selected papers. A "best fit" framework was then inductively generated through charting and coding the evidence themes against domains of the "a priori framework". Emerging themes formed new domains of the framework.
Results:



Conclusions: Ensuring sustainability of HIV programs after donor exit in SSA will require efforts that tackle structural, social, and other equally important non-financial domains of sustainability including contextual factors like disruptive climate crises, pandemics, increasing state fragility and reducing civic spaces, all stakeholders need to be involved throughout the program cycle in iterative manner. there is a growing political will to integrate HIV services within the Universal Health Coverage (UHC) agenda, but this is not translated into financial commitment and prioritization of key populations. The paradigm shift of HIV funding within multilateral entity like the global health security agenda presents an opportunity to continue supporting HIV programs that are not prioritized for domestic funding yet pose epidemiological burden.

EP0940

Estimation of the premium cost for integration of HIV/AIDS, tuberculosis, and family planning into the health benefit package in Nigeria

Y. Hassan Wada[1], J. Anyanti[2], D. Yusuf[1], K. Okoineme[1], O. Idogho[3]
[1]Society for Family Health, Policy , Advocacy and Systems Strenthening, Abuja, Nigeria, [2]Society for Family Health, Strategy, Technical and Growth, Abuja, Nigeria, [3]Society for Family Health, Policy , Advocacy and Systems Strengthening, Abuja, Nigeria

Background: Nigeria continues to develop sustainable models that will provide solutions to vertical disease implementation and fragmentations caused by declining donor funding. Integration is now a growing priority in the context of the AIDS response and has the potential to improve the quality and continuity of care for those living with HIV. We provided an estimation of the premium cost of the additional benefits for HIV, Tuberculosis, and Family Planning in Nigeria.
Description: We estimate the actuarial cost of proposed scenarios and additional benefits to Nigeria's health insurance benefit package and determine the appropriate premium for enrollees to standard benefit plans. This supports the government plan towards paying the premium on vulnerable populations, including those living with HIV. Therefore, we developed a costing model that provides an estimation of the premium cost of additional benefits for HIV, TB, and FP and provides recommendations to ensure adequate integration.
Lessons learned: Given the significant policy interest in scaling up integration, we carried out a large-scale costing study to model the impact of the additional benefits to the current plan. The incremental premiums for three plan options ranged from ₦ 134 to ₦ 557 (0.1 – 0.4 USD) per person per year under four scenarios differing by hospital categories and benefit limits. The additional benefits can be offered as part of the package of benefits or can be outsourced as a benefit package. Several key factors including robust provider network, tariffs, alternative reimbursement methodologies, investment performance, techniques to attract and retain members such as lifestyle loyalty programs, and medical second opinions, should be monitored and controlled to ensure that the additional benefits add to the sustainability of the national health insurance scheme.

Conclusions/Next steps: This estimation of the premium cost towards integration of HIV, TB, and FP largely supports the integration of vertical disease programming and toward accelerating universal health coverage.
Our findings show that integrating the full complement into the base benefit packages will not much change the premium.
The premium rates suggested have been adjusted for expected medical inflation in premium rates and tariffs, bearing in mind that exchange rate fluctuations and a tariff-adjusted rate of 15% are necessary.

EP0941

Towards sustainable HIV Financing in Nigeria: insights from NASA 2019–2021

O. Oshagbami[1], F. Agbo[2], T. Ilori[3]
[1]United Nations Office on Drug and Crime, HIV, Abuja, Nigeria, [2]National Agency for the Control of AIDS (NACA), Research, Monitoring and Evalaution, Abuja, Nigeria, [3]National Agency for the Control of AIDS (NACA), Director General Office, Abuja, Nigeria

Background: Nigeria's HIV response has historically relied on external funding, with 96% of financing in 2021 sourced from international donors. This heavy dependency poses risks to the sustainability of HIV programs. The National AIDS Spending Assessment (NASA) 2019–2021 analyzed resource flows, highlighting gaps in domestic financing and the need for long-term solutions to ensure the continuity of critical services.
Methods: The NASA methodology utilized a top-down and bottom-up approach to track HIV expenditure across public, private, and international funding streams. Data on financing schemes, production factors, and service delivery modalities were collected from key stakeholders, including government entities, donors, and implementing organizations.
Analyses focused on trends in resource allocation, coverage gaps, and the alignment of investments with national priorities.
Results: Total HIV spending decreased from $560.3M in 2017 to $437.8M in 2021. Public sector contributions dropped from $23.1M in 2019 to $17.1M in 2021, representing less than 4% of overall financing. Meanwhile, international donors accounted for 96% of total funding in 2021, with PEPFAR contributing 76% and the Global Fund 19%. ART funding targets were met; however, domestic investments in prevention and testing services lagged significantly, comprising only 9% of total expenditure in 2021.
Additionally, resource allocation for key populations and community-based interventions remained insufficient, highlighting equity gaps.
Conclusions: To reduce donor dependency and ensure program sustainability, Nigeria must prioritize domestic resource mobilization. Key recommendations include integrating HIV services into health insurance schemes, enhancing private sector engagement, and increasing public budgetary allocations for prevention and testing. Strengthening data systems and adopting consumption-based estimation methodologies are critical for improving accountability and resource planning. These measures will support a resilient and self-reliant HIV response in Nigeria.

EP0942

Beyond grants: HIV community-based organizations (CBOs) innovate with revenue-generating social enterprises

A. Arunmanakul[1], S. Turpin[2], S. Mills[1], P. Yun[3], T. Yorn[4], S. Wignall[4], M. Dhakal[5], A. Shrestha[6], M. Pradesi[7], S. Taneja[8], C.L. Ismael[9], J. Young[10], T. Lyutovskaya[11], A. Rsaldinova[12]
[1]Family Health International, EpiC Thailand, Bangkok, Thailand, [2]Family Health International, Amman, Jordan, [3]Chhouk Sar Association, Phnom Penh, Cambodia, [4]Family Health International, EpiC Cambodia, Phnom Penh, Cambodia, [5]Blue Diamond Society, Kathmandu, Nepal, [6]Family Health International, Kathmandu, Nepal, [7]Network of Maharashtra People Living with HIV, Pune, India, [8]Family Health International, EpiC India, New Delhi, India, [9]Regional TB/HIV Support Network, San Fernando, Philippines, the, [10]Family Health International, EpiC Philippines, Manila, Philippines, the, [11]ANSWER, Almaty, Kazakhstan, [12]Family Health International, EpiC Kazakhstan, Almaty, Kazakhstan

Background: HIV-focused community-based organizations led by at-risk populations face sustainability challenges as donor funding declines, necessitating diversified financial strategies. Since 2023, EpiC project has supported social enterprise start-ups (SEs) in five Asian countries, enabling CSOs to generate alternative revenue and enhance financial sustainability.
Initiatives include a fee-based clinic in Cambodia, an online pharmacy in India, a café in the Philippines, a meeting facility in Nepal, and a women-focused wellness center in Kazakhstan.
Description: The project classifies SEs into six critical growth stages, offering tailored support at each step. This framework is a blend of both academic principles and actionable steps to support social entrepreneurs through different stages of their journey.

Stage	Description	Tailored Support
Pre-Seed	Exploring income models without a business idea	Financial model development and exploring available funding options
Concept	Developing a nascent business idea	Refining a lean business canvas and identifying key assumptions to test
Validation	Having a business idea to test in the market	Testing the business plan through customer feedback
Start-up	Selling products/services on a small scale	Accessing capital, financial modeling, go-to-market planning, and progress tracking
Growth	Generating revenue and expanding	Mentorship on management and leadership
Maturity	Achieving optimal scale and revenue goals	Access to growth capital and advanced management mentorship

Lessons learned: Social Enterprises that received targeted business growth support succeeded in generating business revenue and diversifying incomes. The table below summarizes SE stage progress and revenue figures.

Business	Durations of Business Operations	Annual Revenue in FY24	SE Stage
Online pharmacy (India)	18 years	$206,537	Growth
Fee-based clinic (Cambodia)	2 years	$28,267	Start-up
Venue rental space (Nepal)	8 months	$10,258	Start-up
Coffee shop (Philippines)	1 month	$1,806	Start-up

The generated revenues have funded community-benefiting activities, e.g. subsidizing wart treatment for clients at a Cambodian clinic and assisting over 1,000 PLHIV to access subsidized ART via online pharmacy in India.

Conclusions/Next steps: Social enterprises (SEs) offer a flexible and sustainable funding model, complimenting grants from donors while prioritizing community impacts. With proper technical assistance and investment, SEs drive long-term financial resilience and adaptability, enabling CSOs to thrive in evolving funding landscapes.

EP0943

Beginning with the end in mind: the case of the DREAMS program for sustainability attainment for adolescent girls and young women in Phalombe District, Malawi

C. Banda[1], B. Nyirenda[1], N. Madidi[1], T. Chatepa[1], R. Luhanga[1], A. Lakudzala[2], M. Vyazi[2], E. Lembi[2], T. Lillie[3], A. Gotlieb[3], J. Arney[3], R. Nyirenda[4], D. Chilongozi[5]
[1]FHI 360, EpiC Project, Lilongwe, Malawi, [2]Ministry of Gender and Social Welfare, Department of Social Welfare, Phalombe, Malawi, [3]FHI 360, Global Health Programs, Washington, DC, United States, [4]Ministry of Health, Department of HIV, STI and Hepatitis, Lilongwe, Malawi, [5]FHI 360, EpiC Malawi Project, Lilongwe, Malawi

Background: In Malawi, practice dictates that the Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) program, designed to prevent HIV infection among adolescent girls and young women (AGYW), be implemented by local or international nongovernmental organizations (NGOs) before transitioning to government for anticipated local ownership and sustainability. The FHI360's Meeting Targets and Maintaining Epidemic Control (EpiC) project in Malawi implemented a DREAMS component targeting exploited girls and young women. EpiC aimed to fast-track government ownership of the DREAMs program by innovating and providing technical assistance (TA) to the government's Department of Social Welfare (DSW) from the design phase to full implementation.

Description: In October 2022, EpiC engaged the DSW to implement an innovative, differentiated service delivery model to leverage its existing community activities for the DREAMS program. EpiC obtained government buy-in by providing TA that included dedicated officers assigned to the DSW to provide mentorship and ensure that the fidelity and quality of DREAMS interventions were maintained. The DSW facilitated community mapping and integrated DREAMS activities in its annual workplans. EpiC trained DSW Child Protection Officers to deliver individual primary, secondary, and economic strengthening interventions using the Ministry of Health-approved DREAMS Layering Toolkit. Officers facilitated community engagement and identified girls willing to lead the establishment of clubs. Club leads were trained in skills to mobilize peers for HIV prevention services including PrEP, family planning, and economic empowerment.

Lessons learned: By successfully integrating the DREAMS program into its annual workplans and the district development plans, the DSW demonstrated ownership and sustainability intent. The DSW integrated DREAMS implementation into its existing activities, establishing 48 clubs and enrolling 1,209 AGYW. Of these, 1,193 completed the primary package of services, 1,080 were tested for HIV (two tested positive and were linked to treatment), 829 initiated PrEP, and 840 received family planning.

Conclusions/Next steps: Findings reveal that tailored TA and mentorship for government departments, in this case the DSW, have potential for them to implement DREAMS programming. This HIV prevention model provides alternative approaches to implementing DREAMS programming by shifting from an NGO-dependent tradition to government-led programs premised on fast-tracking the government's commitment to ownership and sustainability.

EP0944

Estimating national HIV expenditures: a global analysis of investments for people living with HIV and antiretroviral therapy by income classification

A. Azmitia Rugg[1], L. O'Brien[2]
[1]U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Central America Region, Guatemala City, Guatemala, [2]U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States

Background: As the global community approaches the 2030 target of ending the HIV epidemic, understanding the allocation and sustainability of HIV funding across income groups is crucial.

This study provided a comprehensive analysis of HIV expenditures from 2014–2022, stratified by national income classifications and aligned with progress toward achieving the 95-95-95 target in HIV care.

Methods: A retrospective analysis of HIV expenditure data was conducted using public datasets, including UNAIDS Global AIDS Monitoring and World Bank classifications. Data were adjusted for purchasing power parity (PPP) to ensure cross-country and temporal comparability. Per-unit expenditures were calculated, using expenditures associated with HIV care and antiretroviral therapy (ART), paired with the estimated number of people living with HIV (PLHIV) and users in antiretroviral therapy (ART). All expenditures were reported in USD.

Results: From 2014 to 2022, annual expenditures per PLHIV and per PLHIV on ART, adjusted for PPP, showed notable variations across income groups. In low-income countries (LICs), median expenditures per PLHIV decreased from $636 in 2014 to $484 in 2022. Lower-middle-income countries (LMICs) exhibited modest changes, decreasing from $1,499 to $1,230, while upper-middle-income countries (UMICs) increased from $1,595 to $2,143.

Annual spending per PLHIV on ART declined in LICs, from $576 in 2014 to $402 in 2022, while LMICs fell from $1162 to $594, and UMICs went from $761 to $755. Annual ARV spending also decreased: LICs dropped from $208 to $193, LMICs increased from $134 in 2015 (no 2014 data available) to $292, and UMICs fell from $761 to $464.

Globally, median expenditures per PLHIV on ART declined as countries approached the 95% treatment target, from $906 (41-50%) to $294 (90-100%).

Conclusions: This study showed declining per-unit expenditures for PLHIV and HIV treatment in LICs and LMICs, with efficiency gains as countries approach 95-95-95 targets. Differences in spending across income groups underscore the importance of focused investments to address gaps in LICs and expand access to care.

Strategic investments to improve ART coverage are crucial for ensuring efficient and equitable resource allocation, which can significantly contribute to sustaining progress toward ending the HIV epidemic by 2030.

EP0945

Improving access to private health insurance for communities affected with HIV in India: challenges and recommendations

R. Prasad[1]

[1]*USAID, New Delhi, India*

Background: In India, where the world's second-largest population of people affected with HIV resides, high out-of-pocket (OOP) healthcare expenditures pose a significant barrier to both sustainability and quality of life (QoL). The financial burden of accessing healthcare for PLHIV is substantial, with monthly OOP expenses consuming a large portion of their income, which is, on average, 34% lower than that of non-HIV households. This leads to increased vulnerability to poverty. Private health insurance could reduce this financial burden, but significant barriers exist.

Description: Out of 2.47 million Person Living with HIV in India, an estimated 1.48 million (60%) remain uninsured, only 4% using private healthcare, while 96% depend on government services, often facing overcrowding and HIV stigma.

This study aimed to identify the enablers and barriers to enrolling in health insurance, exploring both demand and supply-side challenges. It included a desk review of 95 secondary sources, 10 key informant interviews (KIIs) with NGOs, CBOs, and insurance companies, and 4 focus group discussions (FGDs) with healthcare providers and community networks.

Lessons learned: The findings revealed that communities affected with HIV OOP expenses range from USD 12 to USD 80 per month. Insurance companies often view People Living with HIV as high-risk, leading to higher premiums and reluctance to market products. The absence of specific actuarial data makes product design challenging, pushing insurers to rely on external data. People Living with HIV with employer-based insurance also face difficulties, as the fear of discrimination discourages them from submitting medical records for reimbursements or renewing insurance. Other barriers include unaffordable premiums, CD4 count-based enrollment restrictions, limited OPD coverage, long waiting periods before coverage begins, and frequent claims rejections.

A framework was developed to address the needs of both insurers and communities . It emphasized the importance of low-cost, high-volume insurance plans with a diversified risk pool. Increased awareness and more product options could strengthen communities bargaining power, while regulatory support can help shape demand and supply.

Conclusions/Next steps: Engaging the private sector is vital for ensuring the sustainability of HIV healthcare in India. Collective action from all stakeholders is necessary to overcome barriers and ensure equitable healthcare coverage for communities.

EP0946

Monetary contributions from users to a community sexual health clinic in Guatemala during 2023 and 2024

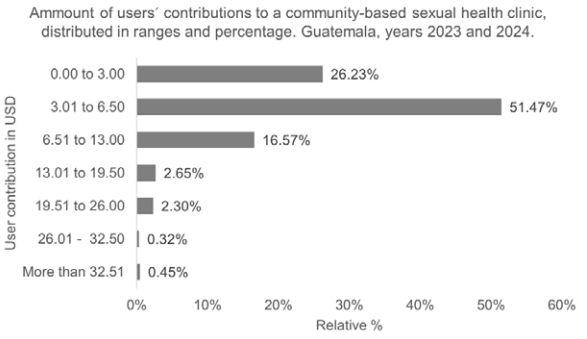
L.A. Gomez Ventura[1], L. Rodas[1], M. Gomez[1], N. Barrientos[1], D. Ixcot[1]

[1]*CAS, Guatemala, Guatemala*

Background: Combined HIV prevention programmes for key population in Guatemala are highly dependent on external cooperation ccording to the local AIDS Expenditure Measurement. Alternatives such as monetary and voluntary contributions from users for the sustainability of services need to be explored in a scenario where the Global Fund withdraws its funding.

Description: About 10,000 people are assisted per year in a community-based combined HIV prevention clinic in Guatemela, providing screening for HIV, syphilis and hepatitis. PrEP, PEP and STI diagnosis and treatment. People come from metropolitan area mainly and 85% are self-reported as MSM and 14% general population. Global Fund and PEPFAR support mainly this cinic and during 2023 and 2024 a campaign was implemented to collect voluntary contributions from users who attended for some service.

These contributions could be made in cash or by credit or debit card and a receipt authorized by the Superintendency of Tax Administration of Guatemala was issued. Regardless of whether the person makes a contribution or not, attention is focused on the person.



Lessons learned: In 2023, 20% of the clinic's operating costs were financed by contributions from beneficiary users. Although some users were sceptical about making a contribution, in 2024 the contribution increased, covering 30% of the clinic's operating expenses, which amount is around US$200,000 without considering administrative costs and costs of supplies such as screening tests and reagents.

Conclusions/Next steps: User inputs can be representative in the sustainability of HIV combination prevention services in key populations. It is necessary to implement communication and social marketing actions to raise awareness of the importance of sustainability of services. But services also need to be implemented from a person-centred and community-led approach. Transparent use of resources and open communication of the need to the community through digital and print channels are also relevant factors in this exercise.

EP0947

Comparing carbon emissions from oral Truvada for PrEP and long-acting injectable CAB for HIV prevention in PEPFAR-supported countries

K. Rodrigues[1], R. Bahrambegi[2], M. Reid[3]
[1]University of Pennsylvania, Washington DC, United States, [2]N/A, Washington DC, United States, [3]UCSF, Institute for Global Health Sciences, San Francisco, United States

Background: Oral Truvada has been successfully scaled through PEPFAR, but adherence challenges have driven increased interest in long-acting injectables (LAIs) such as CAB-LA, which demonstrate superior clinical efficacy for HIV prevention. With PEPFAR and the Global Fund committing to scaling LAIs, including Lenacapavir, to achieve 2 million person-years (PYs) of HIV prevention over the next three years, understanding the environmental implications of this transition is critical.

This analysis estimates and compares greenhouse gas (GHG) emissions from oral Truvada and CAB-LA, focusing on the significant contribution of active pharmaceutical ingredient (API) production to overall emissions.

Methods: We estimated CO_2 emissions for 2 million PYs of HIV prevention with oral Truvada and CAB-LA across the 10 PEPFAR-supported countries with the highest PrEP use. Using emissions factors for API production, we calculated CO_2 emissions per kilogram of API required for dosing 2 million PYs.

Sensitivity analyses explored scenarios of CAB-LA adoption at 12.5%, 25%, and 50% of PrEP users over two years, modeling potential GHG reductions from gradual LAI uptake. To ensure a conservative comparison, emissions related to transport, clinic visits, and freight were excluded.

Results: For 2 million person-years (PYs) of HIV prevention, oral Truvada was estimated to generate 92 million kilograms of CO_2, compared to 3.5 million kilograms of CO_2 for CAB-LA. This represents a >96% reduction in greenhouse gas (GHG) emissions when fully transitioning from oral Truvada to LAI. Projections for different adoption scenarios revealed that slower uptake of CAB-LA would lead to more modest reductions in emissions; if only 12.5% of PrEP users transitioned to CAB-LA over two years, the reduction in CO_2 emissions would be approximately 12%. In contrast, a more ambitious scale-up—achieving 50% of PrEP users on CAB-LA within two years—would generate a 48% reduction in emissions.

Conclusions: Shifting from oral Truvada to CAB-LA offers dual benefits: superior clinical efficacy and significant GHG emission reductions. While this analysis focuses on CAB-LA, similar benefits may extend to Lenacapavir as data become available.

These findings highlight the importance of integrating sustainability into global HIV prevention strategies, aligning health outcomes with global climate goals.

EP0948

A novel approach to sustainability planning of HIV and TB programmes in South Africa

R. Phili[1]
[1]South African National AIDS Council, Pretoria, South Africa

Background: South Africa (SA) has the world's highest HIV epidemic and is amongst the countries with the largest burden of TB. SA government contributes the largest proportion of funding for HIV and TB programmes, but other international funders also contribute significant fund and technical support. Despite the reliance of some programmes on external funding and predicted funding shortfalls, SA lacked a concise Sustainability planning platform, resulting in poor guidance for funders and uncertainty regarding sustainability of HIV/TB programmes. The South African National AIDS Council (SANAC) began the process of development of the National Sustainability Framework (NSF) to ensure that interventions remain on track to attain the national strategic plan goals and maintain the responses beyond 2030.

Description: The NSF development process involved the establishment of a multisectoral technical working group (TWG) for planning oversight. Initial steps involved expert consultations and public consultations, and literature reviews to formulate the NSF that was subsequently validated and approved SANAC coordination structures. The NSF comprises six sustainability domains including financial, epidemic control, service delivery, critical enablers, governance and accountability, and support systems for health. It comprises twenty national programme goals across the six domains.

The accompanying Sustainability assessment and Transition planning tools developed are currently being used for subnational Sustainability and Transition plans. The NSF been updated to align with the latest UNAIDS Sustainability principles and guidance.

Lessons learned: Effective Sustainability planning requires collective understanding and interpretation of Sustainability concepts and arrangements, best achieved through the NSF. The multisectoral TWG is critical in ensuring effective leadership and consistent Sustainability planning. Regular assessments of sustainability arrangements are essential to achievement of Sustainability goals.

Conclusions/Next steps: The NSF has enabled structured approach to sustainability diagnostic assessments and the developing responsive actions. The next steps involve the consolidation of subnational plans into a national Sustainability and Transition plan that will align with the outcomes of the current health reforms in SA. The institutionalisation of Sustainability planning is a critical added step to ensure adequate accountability of Sustainability plans by all stakeholders.

EP0949

Bridging the equity gap: real-world applications of long-acting HIV prevention technologies in low- and middle-income countries

I. Ramon[1], Ibraheem Ramon
[1]Obafemi Awolowo University (OAU), Pharmacy, Ile-Ife, Nigeria

Background: Long-acting HIV prevention technologies, including injectable antiretrovirals and monoclonal antibodies, have revolutionized global HIV prevention efforts. However, the uptake of these innovations in low- and middle-income countries (LMICs) remains hindered by systemic barriers such as limited healthcare infrastructure, financial constraints, cultural stigma, and inequitable distribution. Addressing these challenges is essential to ensure the sustainable and inclusive deployment of these groundbreaking interventions, particularly for marginalized populations disproportionately affected by HIV.
Methods: This study employed a mixed-methods approach, including a systematic literature review, policy analysis, and community-based participatory research. Data were gathered from peer-reviewed journals, policy reports, and case studies of successful HIV prevention interventions in LMICs. Emphasis was placed on identifying structural, cultural, and economic barriers to the adoption of long-acting HIV prevention technologies and assessing best practices for scalable, equitable implementation
Results: The analysis identified three primary barriers: inadequate healthcare infrastructure to deliver long-acting technologies, affordability issues exacerbated by limited funding and high costs, and sociocultural factors such as stigma and lack of awareness in target populations. Successful interventions in certain LMICs demonstrated that community engagement, integration of HIV prevention with other healthcare services, and subsidized pricing models significantly improved access and uptake. However, these approaches remain underutilized and lack broader scalability.
Conclusions: Equitable access to long-acting HIV prevention technologies in LMICs requires targeted strategies addressing healthcare delivery gaps, financial barriers, and cultural stigma. This research highlights the importance of engaging local communities, implementing culturally tailored programs, and fostering global partnerships to drive policy and funding reforms. Bridging these gaps has the potential to transform HIV prevention in LMICs, significantly reducing HIV incidence and improving health outcomes for vulnerable populations.

EP0950

Strategic financial, and leadership directions for HIV NGOs in South Africa beyond 2030 when HIV is no longer a public health emergency

S. Shamu[1,2], P. Race[3]
[1]Centre for Evaluation of Public Health Interventions in Africa, HIV Research, Pretoria, South Africa, [2]University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, [3]University of Reading, Henley Business School, Reading, United Kingdom

Background: Due to sustainable lifesaving ARVs and effective prevention programming, HIV will no longer be a public health threat by 2030 as projected by funders. This also poses survival challenges to NGOs that have, for decades lived on HIV funding.
This paper investigates the NGO strategic options for financial, human resources, and leadership for the post-2030 period when HIV will no longer be considered an emergency disease.
Methods: A cross section of ten national HIV NGOs' and global development partners' senior managers was purposively selected and interviewed using in-depth interviews in 2024. Data were analysed through inductive analysis methods using NVivo to identify themes.
Results: Five key themes emerged from the study. These include: the challenging NGO strategic environment, diverse financial strategic options, human-competence strategic options, the NGO model of change to deal with business uncertainty and the negative effects of the post-2030 HIV non-emergency phase.
Data shows that the senior managers' strategic options include denying that HIV will be phased out as an emergency public-health problem in the post-2030 period, having a passive response to the challenge, diversifying revenue sources for sustainability, and actively engaging in new and alternative non-traditional revenue sources for sustainability.
A priority strategy is seen as the development of social enterprises for revenue development and to plough the funds back into the NGO; this is seen as a requirement for NGOs to start implementing sustainability ahead of the challenging times.
Acquiring social skills and enabling NGO staff to have strong information technology and artificial intelligence skills in the post-2030 period could help harness the opportunities presented to the NGOs.
Conclusions: The study is a wake-up call for many in the development, donor, and NGO sectors. Strategies are required against catastrophe among many HIV NGOs to avoid dependence on donors.

EP0951

Key opportunities to integrate Activity-Based Costing and Management (ABC/M) into existing health data systems and decision-making processes

J. Corlis[1,2], L. Bollinger[1]
[1]Avenir Health, Glastonbury, CT, United States, [2]George Washington University, Washington, DC, United States

Background: Activity-Based Costing and Management (ABC/M) is a client-centered approach to measuring health service delivery costs. By combining direct observation of resources used during health service provision, client exit interviews, and above service delivery-level cost calculations, ABC/M data can be used to identify inefficiencies, cost drivers, possible areas for task-shifting, and adherence to normative health service processes. Policymakers can use ABC/M findings to inform budget prioritization, facility assessments, and sustainability planning. The United States Agency for International Development (USAID) Analytics for Advancing the Financial Sustainability of the HIV/AIDS Response (AFS) project, which is supported by the United States President's Emergency Plan for AIDS Relief (PEPFAR), provides technical assistance to five country governments implementing ABC/M and facilitates the convening of the Regional Technical Network (RTN), a South-South community of practice for resource optimization.
Description: The annual RTN forum fosters cross-country exchange on resource optimization, health financing, public financial management, and sustainability planning. Based on consultations with country delegations at the second RTN meeting and experience implementing ABC/M, AFS identified opportunities to integrate ABC/M into existing data collection and decision-making systems to advance HIV response sustainability.
Lessons learned: Tailored to each country's unique context, there are multiple opportunities to integrate ABC/M into existing country systems and processes. For example, Uganda's Ministry of Finance requested that the Ministry of Health include ABC/M calculations (e.g., average per-client cost of a health service) in budget request justifications. AFS is also exploring, with partner governments, the feasibility of incorporating ABC/M data fields into available electronic medical records and health management information systems which would allow for the simultaneous capture of cost and resource use data during provision of health services. Countries can also use ABC/M outputs as comparators during routine service quality checks.
Conclusions/Next steps: ABC/M offers unique insights into health service delivery through process maps and cost calculations. As countries move forward with these opportunities to integrate ABC/M data capture and use into their existing systems, the RTN and related convenings can provide future opportunities to share more of these lessons learned to support HIV sustainability planning.

EP0952

Moving towards sustainability: lessons learnt from two sustainability assessments of Voluntary Medical Male Circumcision program in Zambia

R. Kamboyi[1], J. Masiye[1], B. Tambatamba[1], K. Lishimpi[2], B. Hamainza[1], H. Phiri[1], C. Zimba[3], P. Lukonde[4], M. Siame[5], T. Mwamba[6], M. Chilembo[6], M. Silondwa[6], O. Chituwo[7], C. Bihini[7], G. Lingenda[8]
[1]Ministry of Health, Public Health, Lusaka, Zambia, [2]Ministry of Health, Permanent Secretary, Lusaka, Zambia, [3]Ministry of Health, Community Health, Lusaka, Zambia, [4]Ministry of Health, Clinical Care and Diagnostics, Lusaka, Zambia, [5]Ministry of Health, Monitoring and Evaluation, Lusaka, Zambia, [6]Clinton Health Access Initiative, Lusaka, Zambia, [7]Center for Disease Control and Prevention, Lusaka, Zambia, [8]USAID, Lusaka, Zambia

Background: Zambia began offering Voluntary Medical Male Circumcision (VMMC) services in 2009, following a joint recommendation by WHO and UNAIDS in 2007. The program has scaled up successfully, with over 5.5 million men circumcised. Initially supported by Implementing Partners, VMMC transitioned into a routine HIV prevention intervention integrated into Primary Health Services. To measure this transition, the Ministry of Health (MOH), with support from the Clinton Health Access Initiative (CHAI), launched the VMMC Transition and Sustainability Plan and the VMMC Transition Assessment Dashboard (VTAD) in 2019. The MOH defines the sustainability of the VMMC program as increasing country ownership to ensure the program's continuity by addressing specific geographical and population transition needs regarding finance, institutionalization, and service delivery. The VTAD measures progress towards six sustainability goals, with assessments conducted in 2019 and 2020.
Methods: Using convenience sampling, program implementation data was collected from 40 districts across Zambia's 10 provinces. This data was obtained through focus group discussions with members of Provincial and District Health teams, including Health Directors, VMMC coordinators, and Health Promotion Officers. Excel workbooks and Google Docs were used to record and collect scores from preset questionnaires. The collected data from the assessments were uploaded into a visual dashboard in Tableau online and analyzed pillar by pillar, comparing the two assessments.
Results: The Supply Chain showed the largest improvement with a 37% increase. Leadership, governance, and coordination saw a 14% increase. Service Delivery improved by 2%, and demand generation by 9%. Monitoring and Evaluation (M&E) and Resource Mobilization both increased by 12%. These incremental changes could generate significant impact over time.
Conclusions: Several lessons were learned from the assessment to build a resilient sustainable VMMC program. Integrated HIV prevention service delivery at all levels of care fosters acceptability and cost-effectiveness. Sustainability should be country-led and defined. Sustainability assessment tools should be designed according to the country-specific definition of sustainability. Transition to sustainability should be gradual and start at the initial

stage of project or program implementation. Senior government leadership should take center stage in the sustainability agenda. The program will use these lessons to implement these findings and replicate in other programs.

EP0953

Impact of incorporating fostemsavir for rescue therapy in Brazil

C. Scopel[1], L. de Melo Nunes Lopes[1], M. Vieira Freire[1], C.A. de Albuquerque Almeida Junior[1], R. Diquique[1], R. Campos Hallal[1], D. Barreira Cravo Neto[1]
[1]Ministry of Health, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis, and Sexually Transmitted Infections, Brasilia, Brazil

Background: Fostemsavir (FTR) is a fusion inhibitor that binds directly to glycoprotein 120 (gp120) located on the viral envelope. This molecule does not present cross-resistance with other classes of antiretrovirals (ARV) and has a favorable adverse event profile, representing an important treatment alternative for multidrug-resistant people living with HIV (PLH). In Brazil, it is estimated that around 500 PLWHA, in the early stages of incorporation, need this drug to continue their treatment and ensure virological suppression and quality of life.
However, the price of ARV was prohibitive and constituted a barrier to incorporation into the Unified Health System (SUS) and access for people who need it. This study aims to discuss access and sustainability in the incorporation of FTR, based on prices and patents.
Methods: The initial price was taken from the Maximum Sales Price to the Government (PMVG) of the Chamber for the Regulation of the Medication Market (CMED); and the final price of the report by the National Commission for the Incorporation of Technologies into the SUS (Conitec). A search for a patent barrier was conducted in Orange Book, Patent Register, Patent Opposition Database, Medspal, WIPO PatentScope and Espacenet.
Results: The initial price, in December 2023, varied from US$ 45.75 (without taxes) to US$ 60.74 (22% taxes) for one tablet of FTR. The final agreed price, in 2024, was US$ 38.67 for one tablet of FTR. One granted patent of FTR was found, whose expiration is scheduled for March 2025, thus constituting a barrier to access and contributing to the high price.
Conclusions: The incorporation of FTR represents an important gain in third-line therapy for multidrug-resistant PLH. However, there is a large difference between the initial price set by CMED and the final negotiated price, indicating that this mechanism may not be effective in regulating high prices. Additionally, due to patent expiration and possible offers of generic versions, there is space for price reduction in the next acquisition.
Additionally, continuous monitoring of national and international prices is necessary, as well as the patent situation to ensure universal access and sustainability of SUS.

EP0954

Compulsory vs. voluntary licensing: good for the people or to the market?

S. van der Ploeg[1], C. Thays Scopel[1], V. Terto Jr.[1]
[1]Brazilian Interdisplinary AIDS Association, GTPI, Rio de Janeiro, Brazil

Background: Patents are property titles tha grant exclusive rights, blocking others from manufacturing, using, or selling the product. This enables pharmaceutical companies to impose high prices, limit competition, and exploit essential needs. Compulsory licensing (CL) is a public health safeguard that allows governments to authorize medicine production without the patent holder's consent. Voluntary licensing (VL), however, is an agreement between the patent holder and a third party under specific terms. This study examines access to ARVs in Brazil through CL and VL, focusing on efavirenz (EFZ) and dolutegravir (DTG).
Description: Since 2006, the Brazilian government has attempted to negotiate EFZ pricing with Merck, the patent holder. After receiving unsatisfactory price reduction proposals, the government issued a CL for EFZ in 2007, under strong social pressure and multisectoral mobilization. At that time, EFZ EFZ was the first-line treatment for HIV/AIDS in Brazil. DTG, now the first-line treatment in Brazil, was introduced in 2017 and is used by over 600,000 PLWHA.
In 2020, the public manufacturer Farmanguinhos/Fiocruz signed a bilateral VL with GlaxoSmithKline (GSK) for DTG technology transfer. However, this secret contract extended GSK's monopoly beyond 20 years, with prices 20 times higher than international benchmarks.
Despite the VL, Fiocruz only imports the drug, with no production steps carried out in Brazil. This situation benefits GSK while undermining local production and affordable access.
Lessons learned: The existence of VL agreements prevents the use of CL as a public health safeguard, these two measures are not only different, but sometimes even compete in guaranteeing lower prices, access to treatments and the sustainability of the health system.
The successful CL experience with EFZ in 2007 underscores the importance of multisectoral mobilization to eliminate commercial barriers that threaten universal healthcare.
Conclusions/Next steps: Pharmaceutical monopolies make Brazil dependent on secret contracts, prioritizing private over public interests. For new treatments, like lenacapavir, CL could eliminate patent barriers, enabling access and local production.
Transparency, justice, and public health must be prioritized. The DTG case demonstrates that VLs often favor private sectors, underscoring the need for public health safeguards to uphold universal healthcare.

EP0955

Optimizing HIV prevention investments: insights from resource mapping in Zimbabwe

D. Rama[1], G. Ncube[2], S. Xaba[2], C. Chivandire[1], B. Pindiwe[1], L. Nyazema[2], A. Svisva[1], A. Mangwiro[1], O. Mugurungi[2], N. Nyathi[1], M. Radebe[1]
[1]Clinton Health Access Initiative, HIV Access Program, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Harare, Zimbabwe

Background: The Zimbabwe National HIV and AIDS Strategic Plan 2020-2026 (ZNASP) serves as a guiding framework for ending HIV as a public health threat by 2030. However, to realize this goal, available resources should be targeted toward geographies and populations with the greatest unmet need and focused on high-impact prevention interventions. Further, amid evolving health priorities and decreasing funding support, it is essential to maximize the impact of every dollar by efficiently scaling up new interventions while sustaining and optimizing existing health programs.
Description: In Zimbabwe, the MOH is implementing an annual HIV prevention resource mapping and financial analyses to evaluate funding and intervention coverage, in line with ZNASP goals. This process complements national health resource tracking efforts, offering granular insights into resource flows by geography, population, intervention and cost classification.
Lessons learned: Since 2021, through an annual resource mapping and financial analysis process which engages key HIV prevention stakeholders the MOH and the NAC has identified key funding gaps, including: 1) insufficient resources for VMMC, STI, and condom programming; 2) underfunding for key populations programming in high-incidence regions. The gaps identified through the resource analysis directly influenced the Global Fund proposal for 2024–2026, ensuring more strategic resource allocation toward high-impact, cost-effective interventions in high-burden areas. As a result, overall HIV prevention funding in 2024-2026 increased by 38% from the 2020-2021 cycle.
Conclusions/Next steps: The HIV prevention resource analysis has been critical for advancing evidence-based planning, alignment with evolving priorities, and informing resource mobilization efforts. By shaping policy dialogue and informing investment decisions, it continues to drive strategic pivots and programmatic adjustments necessary to achieve national HIV prevention goals. The HIV prevention resource mapping and financial analysis, with its structured process and tools, offers a replicable model for implementation in other high-burden settings.

EP0956

Predictive modeling for optimising HIV resource allocation in Lagos State, Nigeria

M. Essien[1], F. Animashaun[2]
[1]Lagos State AIDS Control Agency, Projects, Lagos Island, Nigeria, [2]Lagos State AIDS Control Agency, CEO Office, Lagos Island, Nigeria

Background: Resource allocation is essential for enhancing HIV care, particularly in resource-constrained settings. The study aims to improve funding efficiency and align local HIV efforts with global health targets by developing a model that addresses resource challenges and offers valuable insights for policymakers to help Lagos State achieve its HIV and AIDS goals.
Methods: A quantitative approach was employed to analyse AIDS Spending in Lagos State, leveraging secondary data from State AIDS Spending Assessment reports, epidemiological records, and economic indicators. Data preprocessing included handling missing values, inflation adjustment, and normalisation. Exploratory Data Analysis (EDA) identified spending trends and key correlations. Predictive modeling employed machine learning algorithms for forecasting, with cross-validation ensuring reliability. Publicly available data ensured ethical standards.
Results: The findings showed a heavy reliance on international funds, accounting for 75.78% to 87.50% of total expenditure. Spending per capita and the proportion of GDP allocated to HIV response reveal a weak negative correlation with economic factors. Spending per capita decreased from 0.0062 in 2018 to 0.0024 in 2023, while the proportion of GDP decreased from 239.72 in 2018 to 11.01 in 2023. Predictive models like linear regression, random forests, and decision trees performed poorly, with negative R-squared values ranging from -0.0125 to -0.0113 and mean-squared errors around 529,652,025,898.91 USD. In contrast, Time Series forecasting successfully projected total spending for 2024 at approximately 35,860,609.44 USD, indicating stable spending patterns.
Conclusions: This study underscores the value of these predictive models and highlights critical funding gaps in Lagos State. Key stakeholders and policymakers should prioritise balanced funding, improved resource tracking, and diversifying funding sources. Future reprioritisation will refine these models and expand them to other regions for broader impact.

Costing, cost effectiveness and affordability

EP0957

A cost-utility analysis of an integrated mental health collaborative care model for adolescents and young adults living with HIV or at risk of HIV in Thailand

F. Thomas[1,2], W.N. Songtaweesin[1,2], W. Laohavinij[3,4], N. Witvorapong[5], C. Saisaengjan[1], P. Wongharn[1], P. Thisayakorn[6], N. Assawamasbunlue[1], T. Puthanakit[1]

[1]Chulalongkorn University, Center of Excellence for Pediatric Infectious Diseases and Vaccines, Faculty of Medicine, Bangkok, Thailand, [2]Chulalongkorn University, School of Global Health, Faculty of Medicine, Bangkok, Thailand, [3]Chulalongkorn University, Department of Preventive and Social Medicine, Faculty of Medicine, Bangkok, Thailand, [4]Chulalongkorn University, Department of Data and Digital Resource, Faculty of Medicine, Bangkok, Thailand, [5]Chulalongkorn University, Center of Excellence for Health Economics, Faculty of Economics, Bangkok, Thailand, [6]Chulalongkorn University, Department of Psychiatry, Faculty of Medicine, Bangkok, Thailand

Background: Mental health disorders (MHDs) are common amongst youth affected by HIV, resulting in poor clinical outcomes. Integrating psychological support into HIV services can improve access to mental healthcare. The collaborative care model (CoCM) is a form of integrated mental healthcare whereby non-specialists are guided by psychiatrists to deliver what were previously referral-level services.

This study aimed to conduct a cost-utility analysis of a mental health CoCM versus standard care (i.e., referring clients with MHDs directly to psychiatrists) for youth affected by HIV in Thailand.

Methods: Data were collected from clients aged 15-24 years living with or at risk of HIV, who were managed for depression, anxiety or mixed anxiety-depressive disorder using either CoCM or standard care (SC) at a youth sexual health clinic in Bangkok. Costing and mental health severity data (PHQ-9, GAD-7 and Clinical Global Impression-Severity scores) were collected from the medical records over 12 months, starting at the point of MHD diagnosis. Healthcare provider costs (labour, medication and training), out-of-pocket expenditures and opportunity costs of time were included and expressed as 2023 United States dollars (US$). MHD severity data were converted to utility weights used to calculate quality-adjusted life years (QALYs) using age/sex-specific 'Recovering Quality of Life-Utility Index' mapping models. Analyses were conducted using Stata.

Results: Data from 63 youth were analysed: 36 from CoCM (diagnosed with a MHD between 2020 and 2023) and 27 from SC (diagnosed between 2016 and 2020). Median ages were 21 and 19 years respectively. CoCM cost significantly less per client per year than SC: US$318 (95% CI: US$87-550) less from the societal perspective, US$142 (US$70-215) less from the provider perspective and US$41 (US$23-60) less from the client perspective (P<0.01). Both CoCM and SC were associated with a statistically significant mean QALY gain per client per year (12% and 8% respectively, P<0.001). There was no statistically significant difference in QALY gain between arms (P=0.37).

Conclusions: CoCM was less costly and at least *as* clinically effective as SC in our context, suggesting that CoCM would be a cost-effective way for the Thai health system to provide mental healthcare to youth living with or at risk of HIV.

EP0958

Gaps in HIV care: leveraging community volunteers to enhance health outcomes and cost effectiveness

M. Kibirango[1], E. Sendaula[1], J. Kaleebi[1]

[1]Reachout Mbuya Commuinty Intiative, Finance & Operations, Mbuya, Uganda

Background: HIV care delivery in resource-limited settings faces challenges such as inadequate access, stigma, and financial constraints. Community volunteers, as trusted intermediaries, offer a unique opportunity to bridge these gaps, enhancing health outcomes and cost-effectiveness. We explored the role of community volunteers in improving HIV prevention, care and treatment while reducing program costs.

Description: An implementation science approach was employed to assess the integration of trained community volunteers into HIV care delivery in Kampala city, Uganda. Volunteers conducted community-based testing, provided adherence counseling, and facilitated linkage to care. Specialized roles such as Cervical Cancer Screeners, Non-Communicable Disease Screeners, HIV Testing Services Screeners, and Tuberculosis Monitors focused on disease prevention and early detection. Peer-driven support was delivered by Peer Adolescents, Peer Mothers, Young Adolescent Peer Supporters, and Key Population Peers, targeting high-risk and vulnerable groups. Data clerks and laboratory trainees ensured accurate data management and diagnostics. Quantitative data on HIV testing uptake, care retention, viral suppression, and program costs were collected from thirty-two facilities over 12 months, complemented by qualitative feedback from clients and providers.

Lessons learned: The integration of community volunteers from October 2023 to September 2024 resulted in a 34% increase in HIV testing uptake and a 96% retention rate in care, supporting a total of 115,991 clients. Viral suppression rates reached an impressive 97%. Specifically, volunteer TB screeners increased TB case notifications by **40%** (from 916 to 1,279) and TB cases by **9%** (from 414 to 451). TB treatment initiation also saw a **5% increase** (from 414 to 434).

Task-shifting and community-level service delivery contributed to a 46.49% reduction in operational costs, with volunteers accounting for only 3.51% of the total wage cost. Volunteers played pivotal roles in reducing stigma, building trust, and addressing cultural barriers, demonstrating both significant financial savings and improved organizational efficiency.

Conclusions/Next steps: Community volunteers are a cost-effective and impactful strategy for enhancing HIV care delivery in resource-limited settings. Their contributions improve testing, care retention, and viral suppression while reducing program costs. Scaling up this model, coupled with ongoing training and stronger health system linkages, offers a sustainable solution for advancing HIV care outcomes.

EP0959

Optimizing HIV prevention through integrated supervision: a scalable approach for sustainable and comprehensive care

M. Chilembo[1], J. Michelo[1], B. Longwe[1], M. Silondwa[1], T. Mwamba[1], C. Dube[2], K. Sampa[3], E. Musachi[3], P. Mayeya[4], H. Shakwelele[1], P. Haimbe[1], N. Nyathi[5], M. Radebe[6]
[1]Clinton Health Access Initative, Programs, Lusaka, Zambia, [2]Ministry of Health, Public Health, Ndola, Zambia, [3]Ministry of Health, Public Health, Solwezi, Zambia, [4]Ministry of Health, Public Health, Kasama, Zambia, [5]Clinton Health Access Initative, Programs, Harare, Zimbabwe, [6]Clinton Health Access Initative, Programs, Johannesburg, South Africa

Background: In health programmes, supportive supervision is essential for ensuring high-quality service delivery. In Zambia, traditional technical supportive supervision for HIV prevention processes have been infrequent and narrowly focused on select prevention interventions, mainly the VMMC and PMTCT programmes. These limitations were compounded by the lack of structured follow-up to ensure recommendations are implemented.
To address these challenges, the Ministry of Health (MOH), in collaboration with CHAI, introduced the Integrated Technical Supportive Supervision (iTSS) process in 2021.
Description: The iTSS approach unifies supervision practices across HIV prevention interventions and key components include:

1. **Comprehensive facility assessments:** Evaluating service delivery, workforce capacity, demand generation, supply chain, and quality assurance in 24 facilities.
2. **Collaborative action planning:** Co-developing action plans with clear timelines and responsibilities alongside facility staff.
3. **Targeted capacity building:** Mentoring and training over 350 facility staff to implement all HIV prevention interventions.
4. **Follow-up visits:** Providing ongoing support to ensure accountability and sustained improvements in service delivery.

Between 2022-2024, adherence to national guidelines improved across key interventions, including VMMC, PrEP/PEP, condoms, HTS, PMTCT, and STI services.
Additionally, the integrated framework delivered significant cost savings of $6,000 per facility annually (a 70% reduction), with savings reinvested in follow-up visits to ensure consistent oversight and scale the process effectively.

Costs	Unit Costs	Siloed Process (all interventions assessed at different times	Integrated Process (all interventions assessed at the same time
Fuel costs for transportation	$1.15/km	$621	$104
Drivers for transportation	$102/day	$1,836	$306
Government per diem – national and subnational	$140/day	$5,040	$840
Total costs per facility		**$7,497**	**$1,286**

Lessons learned: The iTSS process highlights the strategic value of integrating interventions, reducing duplication, and optimizing resources. Structured follow-up ensures accountability and sustained improvements in service delivery.
Achieving a 70% cost reduction enabled reinvestment in oversight and continuous improvement. Targeted mentorship proved critical in building workforce capacity to deliver comprehensive HIV prevention care.
Conclusions/Next steps: The iTSS approach offers a scalable, replicable model for integrating HIV prevention interventions while addressing client needs and enhancing program impact. By addressing capacity gaps and ensuring sustained improvements, it provides a pathway for sustainable, high-quality HIV prevention services in Zambia and other similar settings.

EP0960

Cost effectiveness analysis of HIV pre-exposure prophylaxis services in selected states in Southern Nigeria

A. Oyetola[1], B. Ordinioha[2], P. Agada[1], K. Raji[1], Y. Olanlokun[3]
[1]Howard University Global Initiative Nigeria, Abuja, Nigeria, [2]University of Port Harcourt School of Public Health, Port Harcourt, Nigeria, [3]Haas School of Business University of California, California, United States

Background: Pre-exposure Prophylaxis (PrEP) for preventing HIV acquisition in at-risk population is established. However, limited studies are available to evaluate its cost effectiveness in Nigeria. The objective of this study is to evaluate the cost effectiveness of PrEP services in four Southern states in Nigeria. The main outcomes evaluated included number of QALYs gained, number of HIV acquisitions averted, deaths averted, cost gained and the ICER of the intervention.
Methods: The population included were men who have sex with men, people who inject drugs, sex workers and other general population in four states in Southern Nigeria - Cross River, Ekiti, Edo and Osun. Two main scenarios were compared. One where PrEP was implemented for clients and the counterfactual in which PrEP was not available. A deterministic model was constructed to evaluate the cost effectiveness. A micro-costing approach was used. The parameters were derived from multiple data sources including meta-analysis studies, government records, and interviews with essential key informants. We

conducted the analysis through a provider perspective over a time horizon of 40 years and discounted at 3% per annum for both cost and QALYs with assumptions of 99% effectiveness and 95% adherence. We conducted a Markov model to assess the quality adjusted life years and the cost of intervention. We conducted a Probabilistic Sensitivity Analysis, using Monte Carlo simulations to account for uncertainties using 1,000 iterations.

Results: A total of 15,841 clients were provided PrEP services between July 2023 and June 2024. A total of 3901 HIV acquisitions and 481 deaths were averted over the remaining lifetimes of 40 years. The total base incremental QALYs was 25,061.9 with an average of 1.6 per client. When discounted the incremental QALYs and average per client was 12248.5 and 0.8 per client respectively. The incremental cost was $17,004,128.2 and average per client was $1073.4. The ICER obtained was -$703.6/QALY which was dominant over the counterfactual.

Conclusions: PrEP intervention is cost effective in Southern Nigeria. It is important for different HIV programs to prioritize expanding its coverage among eligible clients in Southern Nigeria.

EP0961

Addressing period poverty through social entrepreneurship: AHF's GIRLS ACT gender-sensitive approach to reduce HIV vulnerabilities in Sierra Leone

E. Teh[1], V.P. Oluwatobi[2], M. Jkaisamba[3], L. Buzaalirwa[4], N. Dube[4], D. Tibesigwa[5], O. Gbadamosi[6], P. Lutung[7], M.M. Conteh[8]

[1]AIDS Healthcare Foundation Sierra Leone, Prevention and Advocacy, Freetown, Sierra Leone, [2]AIDS Healthcare Foundation Sierra Leone, Medical Program, Freetown, Sierra Leone, [3]AIDS Healthcare Foundation Sierra Leone, Country Program Director, Freetown, Sierra Leone, [4]AIDS Healthcare Foundation, Quality Management, Kampala, Uganda, [5]AIDS Healthcare Foundation, Advocacy, Kampala, Uganda, [6]AIDS Healthcare Foundation, Advocacy and Policy, Kampala, Uganda, [7]AIDS Healthcare Foundation, Africa Bureau Chief, Kampala, Uganda, [8]Happy Kids and Adolescents, Director, Freetown, Sierra Leone

Background: Access to safe and hygienic menstrual products remains a challenge for several young women and girls due to several reasons including financial constraints and the cultural taboos associated with menstruation. These limitations increase their vulnerabilities to sexual and reproductive health diseases, including HIV.

Sustainable approaches that incorporate education and access to affordable menstrual products can significantly address these vulnerabilities and improve their overall health.

Description: AIDS Healthcare Foundation (AHF) through its flagship GIRLS ACT initiative and partnership with Happy Kids and Adolescent, implemented educational programs and empowered over 150 young persons across 4 communities in 4 districts in Sierra Leone over the past 5 years to be able to make reusable menstrual pads from locally sourced materials. This empowerment created safe space for open discussions, mass distribution of re-usable pads in underserved communities and using the GIRLS ACT club members to sensitize their peers in the community on menstrual hygiene and other sexual and reproductive health issues. Members also received opportunities to market their product to other partners in Sierra Leone.

Lessons learned: Through this initiative and partnership, over 7000 menstrual pads have been distributed and findings from the focused group discussions among the beneficiaries reveled that they feel more confident and self-aware. It also allowed them to generate income for themselves while promoting environmental awareness as well as healthy habits among their peers and the community. Through the gender inclusiveness approach of the initiative, it has helped to reduce stigma, challenged cultural taboos, and fostered shared responsibility for menstrual hygiene. Boys have become vocal advocates for menstrual hygiene, with many actively producing pads for their families and communities. Empowered by this initiative, young people now take the lead in advocacy efforts, raising awareness about menstrual hygiene and other sexual and reproductive health issues within their communities.

Conclusions/Next steps: Gender-inclusive and sustainable strategies that combine education, and social entrepreneurship can transform efforts to address period poverty, reduce vulnerabilities to HIV, and tackle other sexual and reproductive health challenges. These approaches empower young people to take control of their health and well-being while fostering long-term positive change in their communities.

EP0962

Intention to use and cost-benefit analysis of long-acting lenacapavir for HIV pre-exposure prophylaxis among cisgender women experiencing incarceration in northcentral Nigeria: a cross-sectional pharmacoeconomic assessment of community perspective

A. Isah[1,2], G. Ezenri[2], E.J. Ugochukwu[1,2], J.C. Onyehalu[2], C. Nwachuya[2], C.E. Agbo[2], A. Ngige[2], M.M. Abubakar[3,2], C. Idabor[1], B.O. Ukoha-Kalu[4,2]

[1]University of Nigeria, Clinical Pharmacy and Pharmacy Management, Nsukka, Nigeria, [2]University of Nigeria, Person-Centred HIV Research Group, Nsukka, Nigeria, [3]Nigerian Air Force, Directorate of Therapeutic Services, Medical Services Branch, Kaduna, Nigeria, [4]University of Nottingham, School of Medicine, Nottingham, United Kingdom

Background: Long-acting Lenacapavir (LEN) offers a promising HIV prevention strategy especially for risk acquisition population such as cisgender women experiencing incarceration (WEI). Understanding their acceptance of the drug and the cost implications would help policy making in improving access to the twice-yearly HIV pre-exposure prophylaxis (PrEP) medication. This study explored the intention to use and the willingness to pay

for Lenacapavir among incarcerated cisgender females in Nigeria, providing insights to inform policy and implementation strategies.

Methods: Employing a cross-sectional study design, we used an 11-item structured and self-administered validated questionnaire to collect data from (WEI) in eight facilities in northcentral Nigeria. Data was collected between November 2024 and January 2025 using snowball sampling techniques. Cost-benefit analysis was done using contingent valuation, with descriptive and inferential analysis conducted on others using IBM SPSS version 27.0, with significance level set as $p < 0.05$.

Results: We had 80 respondents (response rate: 80.0%), with a mean age of 34.2 ± 8.4 years. Among the respondents, 56 (70.0%) completed primary education, and 48 (60.0%) had served two or more years in prison (n=48). Most of the respondents (n=58, 72.0%) expressed willingness to use long-acting LEN for PrEP. Convenience (n = 52, 65%) and long-lasting protection (n = 40, 50%) were the two most reported reasons for their expression of willingness to use LEN.

However, reported barriers were cost (n = 36, 45.0%) and fear of injections (n = 24, 30.0%). Pharmacoeconomic analysis showed that LEN was cost-effective with an incremental cost-effectiveness ratio (ICER) of $400 per quality-adjusted life year gained.

The predictors of willingness to use LEN were higher knowledge of HIV (aOR: 3.4; 95% CI: 2.0–5.8) and trust in healthcare providers (aOR: 2.9; 95% CI: 1.7–4.6).

Conclusions: The intention to use Lenacapavir among women experiencing incarceration in northcentral Nigeria is high, with a favorable cost-benefit analysis outcome. To enhance the use of Lenacapavir in correctional facilities, barriers such as cost should be addressed.

Additionally, targeted health education and consistent communication and confidentiality should be built between healthcare providers and their WEI clients to improve trust.

EP0963

Exploring the possibility of ending HIV/AIDS in Nigeria by 2030: a holistic perspective on policy scenarios and resource allocation using SmartHIV Manager

E. Demir[1], U. Yakutcan[2], S. Adeyemi[1], A. Eyo[3], O. Onyedinachi[3], E.O. David[3]
[1]Bohemian Smartlytics Limited, Cambridge, United Kingdom, [2]University of Hertfordshire, Hatfield, United Kingdom, [3]Excellence Community Education Welfare Scheme (ECEWS), Abuja, Nigeria

Background: Low- and middle-income countries (LMICs), including Nigeria, face significant challenges in addressing the HIV/AIDS epidemic due to a substantial at-risk population, particularly young adults and key populations, and disparities in healthcare accessibility.

Achieving the UNAIDS 2030 goal of ending the HIV/AIDS epidemic requires an integrated approach encompassing prevention, treatment, and addressing social determinants of health.

Methods: This study evaluates four policy scenarios using SmartHIV Manager™, an AI-powered decision support tool designed to assist policymakers in tracking progress and optimizing interventions. The scenarios consider varying degrees of community involvement, prevention program access, and treatment cascade improvement. Data were analyzed to assess reductions in new infections, HIV-related deaths, cost-effectiveness, and societal impacts.

Results: The baseline scenario highlights the current challenges, while Scenarios 2 and 3 demonstrate substantial improvements. Scenario 2, emphasizing enhanced prevention accessibility, achieved a 70% reduction in new infections and a 55% reduction in deaths compared to baseline. Scenario 3, focused on strengthening the treatment cascade, resulted in a 98% reduction in new infections and an 82% decrease in deaths. These scenarios demonstrated high cost-effectiveness, with costs per life saved at $6,803 and $4,573, and costs per infection averted ranging from $12,356 to $17,922. These findings underscore the critical impact of scaling up prevention initiatives and treatment services nationally.

Conclusions: Ending HIV/AIDS in Nigeria by 2030 is achievable with collaborative, evidence-based, and community-driven strategies supported by user-friendly digital tools like SmartHIV Manager. Scaling up prevention programs, enhancing treatment cascades, and addressing societal drivers such as stigma, low HIV literacy, and social prejudice are essential. Real-time data tracking and adaptive policymaking will enable planners to identify gaps, refine interventions, and optimize resource allocation, ensuring the success of integrated and cost-effective strategies. This study highlights the transformative potential of combining digital innovation with holistic approaches to tackle the HIV epidemic in LMICs.

EP0964

Integrating HIV prevention training into pre-service nursing curriculum: a cost-effective workforce capacity-building model

G. Ncube[1], S. Xaba[1], F. Gwarazimba[1], C. Chivandire[2], D. Rama[2], B. Pindiwe[2], L. Nyazema[1], A. Svisva[2], A. Mangwiro[2], O. Chatsama[3], B.A. Maponga[4], O. Mugurungi[1], E. Tshuma[1], G. Dodzo[1], N. Chiwara[1], N. Nyathi[2], M. Radebe[2]
[1]Ministry of Health and Child Care, Harare, Zimbabwe, [2]Clinton Health Access Initiative, HIV Access Program, Harare, Zimbabwe, [3]Population Solutions for Health, Harare, Zimbabwe, [4]Population Solutions International, Harare, Zimbabwe

Background: HIV remains a critical public health burden in Zimbabwe , necessitating a robust and well-equipped healthcare workforce to drive evidence-based prevention strategies. In 2023, integrated comprehensive HIV prevention service delivery training was included into the nursing pre-service training curriculum.

This strategic intervention sought to institutionalise sustainable workforce capacity while mitigating dependence on high-cost, fragmented in-service training frameworks. The revised curriculum encompasses Volun-

tary Medical Male Circumcision (VMMC), Pre-Exposure Prophylaxis (PrEP), STI programming and HIV Testing Services (HTS), which were prioritised based on evidence indicating their impact on HIV transmission reduction. Trainee nurses are trained in these core competencies, ensuring their preparedness at the point of workforce entry, reducing reliance on costly and fragmented in-service training models.

Methods: A cost comparison evaluation of in-service versus pre-service training models using programmatic budgets. Data was collected from financial records, program budgets, and stakeholder expenditure reports. Training costs included direct expenses—facilitator fees, training materials, venue hire, and per diems—with an analysis of indirect costs such as lost productivity due to workforce absence during in-service training pending.

Standardised cost assumptions were applied to calculate per-nurse training expenses under both models. For the pre-service model, a 70% reduction in costs was assumed based on the streamlined integration of training into the existing curriculum.

Results: The conventional in-service model incurs an annual expenditure of $1,782,000 for 900 nurses, whereas the pre-service framework requires $534,600, yielding a cost avoidance of $1,247,400 annually (70%). Disaggregated savings include $617,400,200 from VMMC integration, and $315,000 each from PrEP and HTS training. Beyond cost savings, this model enhances workforce readiness by reducing onboarding times and ensuring competency-based education. Key performance metrics, such as knowledge retention, clinical proficiency assessments, and post-training service delivery rates, are being monitored to evaluate long-term effectiveness.

Conclusions: Integrating HIV prevention training into Zimbabwe's nursing pre-service curriculum is a cost-effective, sustainable solution for workforce development. Eliminating reliance on costly in-service training saves over $1 million annually and equips graduates to deliver high-quality prevention services immediately, enhancing workforce readiness and scalability.

EP0965

Out-of-pocket costs of seeking HIV care among young people living with HIV in Tanzania

A. Zimmerman[1], A. Fawole[1], E. Senkoro[2], O. Ogbuoji[1], D. Dow[1]

[1]Duke Global Health Institute, Durham, United States, [2]Kilimanjaro Christian Medical Centre, Moshi, Tanzania, the United Republic of

Background: Meeting the 95/95/95 targets will require a renewed focus on young people living with HIV (YPLWH), who now represent a large and growing proportion of the global HIV epidemic. Understanding the out-of-pocket costs incurred by YPLWH when seeking HIV care is crucial to developing new models of care, interventions, and policies that meet the needs of this patient population.

This study reports the out-of-pocket costs incurred by YPLWH seeking HIV care enrolled in the Sauti ya Vijana (SYV) clinical trial in Tanzania.

Methods: SYV is a peer-led mental health and life skills intervention designed to improve clinical HIV outcomes among YPLWH in Tanzania. Participants were enrolled from March 2023 to July 2024 with inclusion criteria: 1) 10-24 years of age, 2) attend an HIV clinic, 3) receive antiretroviral therapy for at least 6 months, and 4) know their HIV diagnosis. We adapted the Cost for Patients Questionnaire that captures patient direct medical, direct non-medical, and indirect costs associated with seeking HIV care. We report annual costs and compare these costs to the annual income across all trial participants.

Results: The SYV trial enrolled 690 participants. The median annual income among participants was USD 689.90 (IQR: 370.69 – 1,441.58). Median annual direct medical costs amounted to USD 10.69 (1.5% of annual income) for medical visits including those not related to HIV care and USD 19.01 (2.8% of annual income) for homecare related to HIV. Median annual direct non-medical costs amounted to USD 2.38 (0.3% of annual income) for transportation to HIV clinic appointments, USD 0.00 (0.0% of annual income) for food during time spent in the HIV clinic, USD 6.34 (0.9% of annual income) for childcare during time spent in the HIV clinic, and USD 3.17 (0.5% of annual income) for expenses related to bringing a companion to HIV clinic appointments. Median annual indirect costs amounted to USD 3.96 (0.6% of annual income) for income lost due to time spent at an HIV clinic.

Conclusions: These results provide evidence on the magnitude of out-of-pocket costs incurred by YPLWH seeking and obtaining HIV care in Tanzania, and may help inform national health policy decision-making and implementation.

Health systems, health systems strengthening and partnerships

EP0966

Comparing the impact of pick-up point type on adherence to laboratory monitoring guidelines for HIV and diabetes in South Africa's Central Chronic Medicine Dispensing (CCMDD) programme

J. Jarolimova[1,2,3], J. Yan[4], M. Nzuza[5], S. Govere[5], A. Khumalo[5], Z. Shazi[5], D. Zionts[2], K. Rahman[2], N. Dube[5], R.A. Parker[4,3,6], I.V. Bassett[1,6,7]

[1]Massachusetts General Hospital, Infectious Disease, Boston, United States, [2]Massachusetts General Hospital, Medical Practice Evaluation Center, Boston, United States, [3]Harvard Medical School, Boston, United States, [4]Massachusetts General Hospital, Biostatistics Center, Boston, United States, [5]AIDS Healthcare Foundation, Durban, South Africa, [6]Harvard University Center for AIDS Research, Boston, United States, [7]Africa Health Research Institute, Durban, South Africa

Background: South Africa's CCMDD programme allows clinically stable people living with chronic conditions, including HIV and diabetes mellitus (DM), the choice of collecting treatment at community- or clinic-based 'fast-track' pick-up points. We assessed whether type of pick-up point affected adherence to laboratory monitoring recommendations for HIV and DM.

Methods: We enrolled two contemporaneous observational cohorts of adults (≥18y) at time of CCMDD enrollment in Umlazi, KwaZulu-Natal:

1. HIV cohort from 8 public sector clinics (CCMDD-eligible if on ART ≥1y and virologically suppressed) and
2. DM cohort from a public hospital-based clinic (CCMDD-eligible if HbA1c ≤7% in past 6mo).

We assessed adherence to CCMDD eligibility criteria at baseline and laboratory monitoring guidelines at 12 months, focusing on pick-up point type (community vs. clinic), using multivariable regression models.

Results: Among 1,856 participants in the HIV cohort, 67% were female, with median age 36y (IQR 30-43). 1,774 (96%) had a suppressed viral load at CCMDD enrollment. Over half (977, 53%) chose community ART pick-up.

Overall, 1,390 (75%) had a 12-month viral load measurement. Among 210 participants in the DM cohort, 67% were female, with median age of 59y (IQR 50-65). Only 28 (13%) had HbA1c ≤7% at CCMDD enrollment. 90 (43%) opted for community pick-up. 110 (52%) had a 12-month HbA1c measurement. For both cohorts, opting for community (vs. clinic) pick-up point was not associated with having a laboratory measurement or meeting guideline criteria at 12 months *(Figure)*.

Conclusions: In this multi-site study of the CCMDD programme in South Africa, adherence to baseline eligibility and 12-month laboratory monitoring guidelines was better for HIV than DM. Choice of pick-up point (community vs. clinic) was not associated with adherence to monitoring guidelines. While community pick-up of medications for HIV and DM did not affect receipt of guideline-concordant care, monitoring for DM in CCMDD is suboptimal.

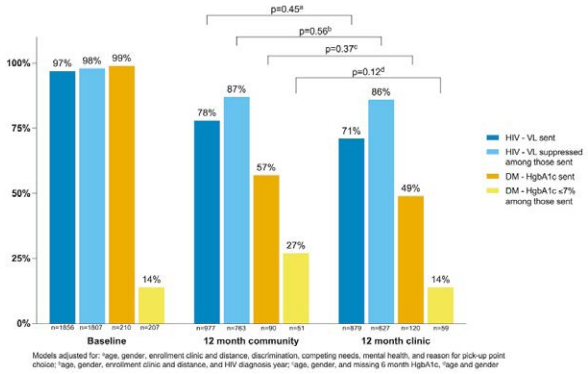


Figure.

EP0967

Insights from initial stakeholder engagement on one-stop PrEP provision: a qualitative analysis

J. Tsetso[1], B. Kwach[1], J. Odoyo[1], Z. Kwena[1], A. Lauff[2], V. Omollo[1], J. Morton[2], K. Ngure[2,3], K. Mugwanya[2], E. Bukusi[1,2,4]

[1]Kenya Medical Research Institute, Center for Microbiology Research, Kisumu, Kenya, [2]University of Washington, Global Health, Seattle, United States, [3]Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya, [4]University of Washington, Department of Obstetrics and Gynecology, Seattle, United States

Background: Robust stakeholder engagement is essential to effective project implementation. We held an initial stakeholder engagement meeting in Kisumu County, Kenya, to garner input on a One-Stop Shop (OSS) Pre-Exposure Prophylaxis (PrEP) provision model.

Description: The One-Stop PrEP Care Project seeks to test the effectiveness of the 'OSS' to improve PrEP delivery and continuation in public health facilities (R01 MH 129234-0A1). Key stakeholders were purposefully identified and invited to a one-day meeting facilitated by the Ministry-of-Health PrEP focal person on September 12, 2023. Stakeholders were categorized into four groups: County health management teams (CHMT), facility in-charges, service providers, and PrEP implementing partners.

Discussions were guided by five thematic semi-structured questions focusing on the OSS model's benefits, challenges, and implementation strategies. We analyzed and reported findings using inductive thematic analysis.

Lessons learned: 50 participants attended the stakeholders' meeting. We had 18 CHMTs, 12 facility in-charges, 14 service providers, and 6 PrEP implementing partners.

All the groups unanimously agreed on the benefits of the OSS model because it is time-saving, improves service quality, and enhances client-provider relationships.

Anticipated challenges identified across all groups encompassed staff shortages, commodity stockouts, and limited space.

The proposed solutions included staff capacity-building and supply chain optimization. Implementing partners further suggested reinforcing demand creation and service integration by providing services other than PrEP, in

the OSS clinics, such as reproductive health services. Additional recommendations focused on staff motivation and flexible working hours to meet client needs effectively.

Conclusions/Next steps: This analysis underscores the importance of stakeholder engagement in implementing and sustaining effective PrEP delivery models in public health settings. Areas of agreement, convergence, and solutions to challenges of the OSS PrEP model were identified and incorporated into the ongoing implementation to improve PrEP service delivery.

EP0968

Strengthening health systems through key population mapping and size estimation: insights from Bauchi State, Nigeria

G. Obiero[1,2]

[1]AGE Solutions for International Devlopment, Research and Devlopment, Abuja, Nigeria, [2]Institute of Human Virology, Research for Development, Abuja, Nigeria

Background: The Key Population Mapping and Size Estimation (KPSE) project in Bauchi State, Nigeria, aimed to understand the challenges faced by key populations (KPs) such as female sex workers (FSWs), men who have sex with men (MSM), people who inject drugs (PWID), and transgender individuals (TG) who are disproportionately impacted by HIV.

By utilizing the Multiple Source Capture-Recapture (MS-CRC) method, this project identified over 2,000 hotspots, many located in underserved areas, and revealed significant gaps in access to HIV prevention and care services.

Description: Implemented over six months, the project focused on hotspot mapping and population size estimation using MS-CRC methodology. It involved conducting surveys across 2,000+ hotspots, such as brothels, street locations, and uncompleted buildings, capturing essential demographic data. The results highlighted a key challenge: only 39.4% of hotspots were within 1 km of healthcare services.

The program integrated community leaders, trained over 70 field staff, and collaborated with healthcare providers to ensure accurate data collection. Through these efforts, it provided evidence to guide resource allocation for HIV services targeting KPs.

Lessons learned:

- Collaborative Engagement: Partnering with local stakeholders, including healthcare providers and community leaders, enhanced data accuracy and ensured culturally appropriate interventions.
- Accessibility to Services: The findings underscored the critical need for mobile health services and decentralized HIV care.
- Data-Driven Strategies: Utilizing Bayesian latent class modeling for population size estimates was crucial for resource allocation and designing focused interventions.
- Community Trust: Involving KPs in the process helped reduce stigma, leading to more effective and trusted data collection.
- Capacity Building: Training field data collectors ensured data reliability and fostered respect for KPs during the data gathering process.

Conclusions/Next steps: This project underscores the necessity for tailored, localized HIV interventions and service delivery models for KPs. The findings advocate for expanding mobile health clinics to reach underserved hotspots, strengthening partnerships with local leaders to address stigma, and enhancing data-driven decision-making for efficient resource allocation.

These initiatives will contribute to reducing HIV transmission and achieving the UNAIDS 95-95-95 targets, setting a precedent for more resilient, equitable healthcare responses in Bauchi State and beyond.

EP0969

Evaluating the role of health system capacities in the effectiveness of HIV interventions in Cameroon

A.M. Kelly[1]

[1]University of Dschang, Dschang, Cameroon

Background: This study assessed how Cameroon's health system's capabilities affect the efficacy of HIV interventions. It postulated that strong resources, qualified personnel, and a strong healthcare infrastructure would increase the effectiveness of prevention and treatment initiatives. The goal is to pinpoint important aspects of the health system that affect how well HIV interventions work to lower transmission and enhance care.

The study was carried out in four different regions of Cameroon: Garoua (North), Bafoussam (West), Douala (Littoral), and Yaoundé (Center) between January 2022 and December 2023.

Methods: A cross-sectional survey and a retrospective cohort analysis were combined in this study, which included 500 participants chosen through stratified random sampling to ensure representation of both genders and ages. Data were gathered via questionnaires, interviews, and evaluations of medical records, looking at metrics such as ARV access, healthcare staff density, and infrastructure quality. Key health system determinants influencing the effectiveness of HIV interventions were discovered by the study using multiple regression models and factor analysis. Participants comprised both medical professionals and people living with HIV.

Results: The study revealed a positive correlation between HIV intervention outcomes and health system capacities. Specifically, a 1% increase in healthcare worker density was associated with a 0.15 unit increase in the effectiveness of HIV treatment programs ($p < 0.05$). Access to ARVs showed a similar positive correlation, with a 1% increase in drug availability correlating with a 0.2 unit improvement in treatment adherence and viral suppression. Disaggregated by gender and age, women (45%) and individuals aged 30-45 years (50%) showed higher adherence rates than men and younger populations. Additionally, regions with better healthcare infrastructure (Yaoundé and Douala) demonstrated a 25% higher success rate in HIV prevention efforts, compared to regions with less robust healthcare systems (Bafoussam and Garoua).

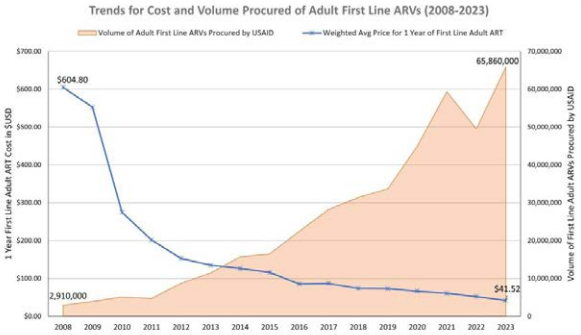
Conclusions: According to the findings, enhancing HIV treatment outcomes requires bolstering the healthcare system, hiring more qualified healthcare professionals, and guaranteeing steady access to ARVs. Future initiatives should concentrate on resolving regional differences in healthcare access.
These advancements could dramatically lower HIV transmission rates and improve the quality of life for those living with the virus.

EP0970

PEPFAR supply chain: from emergency response to sustainable solutions

J. Rosenfeld[1], C.Y. Malati[1], M.O. Douglas[1], J. Williams[1], J. Kuritsky[1]
[1]United States Agency for International Development, Bureau for Global Health/Office of HIV/AIDS, Washington, United States

Background: The United States Agency for International Development established supply chain programming as an integral component of PEPFAR's efforts, realizing the need for the availability of commodities to expand testing and lab diagnostics, and the treatment of PLHIV with clinically optimized ARVs.
This abstract reflects on the achievements and lessons learned for managing a global disease supply chain.



Description: Although funding has remained flat for HIV programming, USAID's HIV supply chain has implemented innovations to expand HIV commodity supply to cover more clients, while decreasing commodity costs. This is exemplified in the graph below noting how efficiencies gained in procurement, freight transport, commodity data visibility, and collaboration with HIV commodity buyers and manufacturers resulted in the cost for one year of first line Adult ART decreased from $604 in 2008 to $42 in 2023, while ARV procurement increased to over 65 million in 2023.
Additionally, USAID's HIV supply chain shifted procurement to ARV bottles of three and six month tablet counts to support multi-month dispensing, resulting in improvements for client-centered care.
Lessons learned:

- Establishing collaborative relationships between clinical cadre and supply chain to implement mutually beneficial programming, such as multi-month ARV dispensing.
- The utilization of economies of scale through procurement created leverage in HIV commodity markets, resulting in cost competition among suppliers, and expanding supply chain management risk among various stakeholders leading to increased shipping/storage efficiencies.
- Supply chain system improvements are beneficial and transferable to all aspects of a country's health systems from laboratories to data management.

Conclusions/Next steps: Supply chain efficiency gain opportunities are available at the country-level. Moving forward, USAID's HIV supply chain work will focus on PEPFAR countries, intending to build country capabilities to coordinate public and private-sector resources to support their HIV commodity needs, with minimal donor support.

EP0971

Onsite mentorship and training in rural health facilities: a strategy to sustain HIV services for high-risk populations, Mazowe District, Zimbabwe, 2024

C. Hera[1], P. Moyo[2], A. Amadi[1], T. Sola[1], T. Sibanda[1], A. Mufandaedza[3], K. Chisenwa[3], J. Murungu[2], E. Chidovi[1], R. Dhliwayo[1], B. Mushangwe[1], G. Gonese[1], B. Makunike[1], K.A. Thomson[4], T. Mharadze[5]
[1]Zimbabwe Technical Assistance, Training and Education Center (Zim-TTECH), Harare, Zimbabwe, [2]Pangaea Zimbabwe, Harare, Zimbabwe, [3]Ministry of Health and Child Care (MoHCC), Mazowe, Zimbabwe, [4]University of Washington's International Training and Education Center for Health (I-TECH), University of Washington, Seattle, United States, [5]Division of Global HIV and TB (DGHT), U.S. Centers for Disease Control and Prevention (CDC) Zimbabwe, Harare, Zimbabwe

Background: Zimbabwe is successfully driving down HIV incidence, shifting from a generalized epidemic to one concentrated in high-risk populations (HRPs). Efficient resource allocation is crucial to sustain progress, particularly in rural areas where limited resources pose challenges for staff training and supervision.
In response, the Zimbabwe Partnership to Accelerate AIDS Control (ZimPAAC) implemented onsite training and mentorship to support mentorship and training of health facility teams as well as community engagement through community volunteers. Previously, central-level training was then cascaded to sites by the trainees, not always effectively.
Description: From April to September 2024, ZimPAAC coordinated a joint support and program monitoring team comprising district health executives and implementing partners. They mentored facility teams on HIV risk assessment, including Pre-exposure prophylaxis (PrEP) eligibility, and providing HRP-competent services across 29 facilities in Mazowe District.
Monthly onsite training and mentorship sessions targeted all facility staff, with a focus on those historically excluded from national or provincial training due to budget constraints and were scheduled during off-peak hours to minimize service disruption.

Additionally, the team mentored 35 community cadres, including peer HRP members, to generate demand for HIV services and improve treatment adherence in remote rural communities among HRP. We compared program reach from October 2023 to March 2024 (before support) with April to September 2024 (after support).

Lessons learned: Following implementation, HIV testing among HRPs increased by 194%, from 381 to 1,120 HRPs tested (547 referred by peer HRPs from the community). PrEP Initiations rose by 335%, with new initiators increasing from 165 to 718, and PrEP continuation improved by 74% (from 269 to 468 HRPs).

Overall, HRPs in HIV care increased by 8% (from 305 to 329). Tracking of viral loads improved by 17% (from 233 to 272), with viral load suppression increasing by 16% (from 226 to 263).

Conclusions/Next steps: Onsite mentorship and support approach to training team members at healthcare facilities may increase health services uptake amongst HRPs in resource-constrained environments.

Involving community cadres may enhance demand for HIV services and ensure the continuity of HIV care within communities, including high-risk populations and offer potential for sustainability in service provision.

EP0972

Understanding and expanding the role of private health insurance in improving affordable healthcare access for people living with HIV: a case study from India

S. Perabathina[1], S. Koseki[2], H. Tessema[2], L. Bollinger[3], A. Gerrard[4]

[1]Palladium India, Delhi, India, [2]Palladium, Washington, United States, [3]Avenir Health, Glastonbury, United States, [4]United States Agency for International Development, Washington, United States

Background: As antiretroviral therapy becomes more widely available and people living with HIV (PLHIV) live longer, continued access to an affordable, diversified benefit package of care is critical. The private health insurance (PHI) market could strengthen healthcare financing and deliver comprehensive services to a diverse client base. Since 2023, India's national policies have mandated that PHI schemes cover HIV-related services and be accessible to PLHIV, offering an opportunity to explore PHI market potential.

Methods: This study conducted a literature review, five key informant interviews (KIIs) with PLHIV support organization representatives, four KIIs with PHI representatives, and two focus group discussions with 17 private healthcare providers. We analyzed challenges and opportunities from demand- and supply-side perspectives, identifying opportunities that could help ensure PHI is accessible and affordable for PLHIV.

Results: On the demand-side, PLHIV often faced financial hardship paying out of pocket for chronic illnesses, including HIV. Yet, they did not participate in PHI as they often lacked an understanding of health insurance or feared their PLHIV status being publicly disclosed during enrollment or claims processes. On the supply-side, one year into policy implementation, nine of 30 PHI products were HIV-inclusive. Providers expressed that stable PLHIV clients are low-risk because ART compliance is high; however, PHI companies still perceived PLHIV as high-risk, citing a lack of actuarial data. Companies did not target marketing their products to PLHIV, limiting awareness of these products among PLHIV, and exclusion periods (up to 48 months) before coverage began for care related to pre-existing conditions including HIV affected product attractiveness.

Conclusions: Further incentives may be necessary to stimulate private market participation to realize the full potential of India's PHI policies. Several factors enable PHI accessibility for PLHIV. Raising awareness and improving financial literacy among PLHIV are key to increasing their engagement with PHI.

Providing PHI companies with actuarial data and regulating the exclusion period companies can impose could bolster developing and expanding a range of insurance options for PLHIV. While the market develops, co-financing or premium subsidies may be necessary to ensure the price of PHI does not exceed PLHIV's ability to pay.

EP0973

Peer-led models: a transformative approach to enhancing positive health outcomes in children and adolescents living with HIV/AIDS. lessons learnt from Lusaka District, Zambia

W. Kanjipite[1], J. Phiri[1], L. Nkhoma[1], C. Kambikambi[2], C. Bolton[1], E. Ngulube[2], S. Mungunda[3]

[1]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [2]Project Hope, Lusaka, Zambia, [3]USAID, Lusaka, Zambia

Background: Whilst significant investment has been made in the fight against the HIV epidemic in Africa, children and adolescents have continued facing unique challenges in accessing testing and treatment services compared to other populations. These challenges include health services that are not tailored to their needs and preferences, with disproportionate access to HIV services, resulting in poor adherence to treatment with lower rates of viral suppression and higher morbidity and mortality.

With funding from the United States Agency for International Development (USAID), the Centre for Infectious Disease Research in Zambia (CIDRZ) with technical support from Project HOPE has been implementing a five-year project aimed at mitigating the impact of HIV and improve the health and wellbeing of Vulnerable Children and Adolescents (VCA).

This program, known as the Empowered Children and Adolescents Program III (USAID ECAP III) demonstrated the effectiveness of peer led models in improving positive health outcomes among children and adolescents living with HIV (C/ALHIV) in Lusaka District.

Description: USAID ECAP III implemented the Community Adolescent Treatment Supporters (CATS), a peer-led differentiated HIV service-delivery model for C/ALHIV. A total of 71 CATS, aged between 18 and 20 years old with an

excellent adherence record were trained and mentored to assist C/ALHIV on a larger scale, guiding them towards resilience and success. The CATS model used three platforms: teen clubs, C/ALHIV support groups and household case management to deliver a series of HIV services such as adherence counseling and addressing mental health related issues.

Lessons learned: Between FY21 and FY24, both Viral Load Coverage (VLC) and Viral Load Suppression (VLS) improved by 5 percentage points, among 2,605 adolescents enrolled on CATS aged between 10 and 17 years old. Specifically, VLS increased from 92% in FY21 to 97% in FY24, while VLC rose from 81.2% to 87.4%. The increase in VLC was statistically significant (p= 0.009). Notable mental health gains were also observed among adolescents.

Conclusions/Next steps: The peer-led support model has demonstrated its effectiveness in helping adolescents adhere to treatment regimens, manage stigma, and develop self-acceptance. Given these positive outcomes, USAID ECAP III plans to scale up this model across all facilities in supported districts.

EP0974

Improving the quality of the centralised chronic medicines dispensing and distribution (CCMDD) programme - dormant list actioning in Thabo Mofutsanyana district in the Free State

A. Melamane[1], S. Mulibana[2]
[1]Right To Care NPC, Pharmaceutical Services, Bethlehem, South Africa, [2]Right To Care NPC, Centurion, South Africa

Background: The CCMDD programme provides a differentiated model of care for stable people on chronic treatment. It is necessary to promote facility level audits that look at the magnitude and drivers of patient retention to inform programmatic decisions. A client whose last medicine parcel was dispatched more than 11 weeks ago, and no new prescription has been received by the service provider is considered dormant. This means that this client may have interrupted back to the clinic or at risk of lost to follow up.

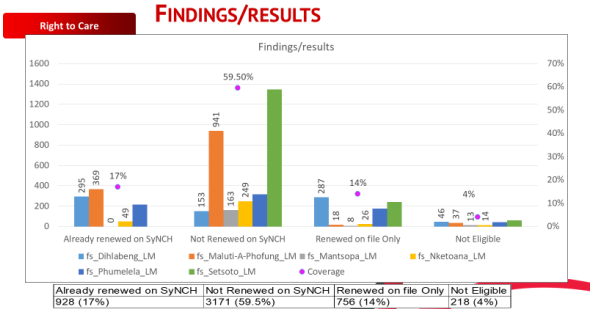
The study aimed to establish reasons for CCMDD clients missing their appointments and becoming dormant and interventions implemented in Thabo Mofutsanyane district.

Methods: An operational study design was used where file audits for CCMDD clients were conducted between April and June 2024 using the dormant list report from the service provider in the respective facilities. The dormant list was checked against Synchronised National Communication in Health (SyNCH) and Tier.Net to verify the client status, and the outcome was recorded and submitted to the service provider to update client records.

Results: Of the 5332 files audited, 1745 (34%) were already renewed on SyNCH, 3171 (59%) clients had eligible prescriptions that were not renewed. 756 (24%) clients had prescriptions renewed on facility file only, while 254 (5%) clients were no longer eligible for CCMDD . Only 35 (0.6%) were confirmed lost to follow up.

Interventions implemented included renewing of 1414 prescriptions that were still eligible, 972 clients were booked for script renewal, 14 clients were referred for tracing, 25 deregistered and 395 deactivated from CCMDD.

FINDINGS/RESULTS



Already renewed on SyNCH	Not Renewed on SyNCH	Renewed on file Only	Not Eligible
928 (17%)	3171 (59.5%)	756 (14%)	218 (4%)

Conclusions: The audits indicated that majority of prescriptions were not renewed on time. Interventions in facilities should focus on improving prescription renewal and improving SyNCH utilisation to improve retention.

EP0975

Partnership in action: how Ahana Project boosted HIV testing through private sector involvement in PMTCT intervention in 13 states of India. Results from Ahana Project supported by GFATM

K. Biswas[1], L. Rathore[1], S. Dasgupta[2], R. Rana[2]
[1]Plan International (India Chapter), Monitoring & Evaluation- GF, Delhi, India, [2]Plan International (India Chapter), Programme, Delhi, India

Background: Govt. of India has set a goal to saturation of pregnant women with HIV testing towards achieving EMTCT. While the country has an extensive public health system, there is an estimated 20-25 percent out of 29 million annual pregnancies catered by the private sector. Project AHANA funded by The Global Fund engaged private hospitals to ensure HIV screening of PW and reporting back to national data systems.

Description: Complementing the effort in the public sector towards expansion of HIV testing, a fourfold approach was introduced to engage and integrate private sector effort to country's overall EMTCT programme:

A. Mapping of all private entities,

B. Carrying out service assessment of the facilities,

C. Establish programme engagement with the hospital towards HIV testing and reactive linkages and;

D. Report HIV testing information to national database.

Lessons learned: Altogether A) 21,761 private hospital mapped for potential engagement, B) assessment carried out in 21, 749 hospitals with C) 8, 321 hospitals assessed as ANC service providers, and D) 5, 592 hospitals engaged in the project during the period of Jan, 18 to March, 24.

These engaged hospitals then started reporting back with the HIV testing information as well as aligning for any HIV reactive cases needs confirmatory testing at Govt. ICTC centre and followed up with ART linkages. 16.2% (n=2 million) HIV screening has been carried out in private sector during 2023- 24. Proportion of HIV testing reported from private sector has increased to more than 16%

during the period 2023-24 from 10% during Jan, 18- March, 21. This made sure identification of HIV positive pregnant women and linking them with PMTCT coverage; 180 pregnant women could be identified through Pvt. Sector testing in 2023-24 alone.

Conclusions/Next steps: There is a strong coordination established with the private health facilities contributing towards attaining EMTCT. Over the years Plan India evolved private sector strategy to map, assess and engage more and more private health facilities.

While there is a long way to go and a complete saturation of all cases in the private facilities, the intervention suggests, that EMTCT can be possible only through an integrated public private sector response.

EP0976

Empowering young girls and women to decide over their own bodies and Ensure Universal access to comprehensive adolescent and youth-friendly SRHR information and services

P. Kigongo[1]

[1]ACT4AFRICA, Community Development, Jinja, Uganda

Background: The EYE Universal SRHR Project, funded by the Norwegian Embassy, aims to address critical gaps in adolescent sexual and reproductive health rights (SRHR) in Uganda. Implemented from 2023 to 2025, this initiative seeks to reduce maternal deaths, unintended teenage pregnancies, and gender-based violence. It also focuses on increasing access to youth-friendly SRHR services and addressing harmful gender norms.

The project targets adolescents aged 10–24, women of reproductive age, and community stakeholders in the Mayuge and Kamuli districts Uganda.

Description: The project adopts a multi-faceted approach to strengthen community and health systems for delivering SRHR services. Key interventions include:

1. **Youth Empowerment:** Formation of youth savings and loan associations, entrepreneurship training, and the establishment of school-based health clubs to foster agency among adolescents.
2. **Capacity Building:** Training healthcare providers in public and private sectors to deliver high-quality youth-friendly services, including long-acting contraceptives.
3. **Community Engagement:** Mobilizing local leaders, youth groups, and community-based trainers to promote demand for SRHR services and combat gender-based violence.
4. **Policy and Advocacy:** Generating evidence to support district-level planning, budgeting, and multi-sectoral coordination while engaging religious and cultural leaders to influence grassroots interventions.

Lessons learned:

- Collaborative efforts between youth, communities, and local governments have fostered ownership and sustainability.
- Youth-led initiatives, including advocacy and accountability movements, have increased awareness and demand for SRHR services.
- Integration of SRHR into broader development programs enhances reach and impact, particularly for underserved populations.
- Addressing harmful social norms requires consistent engagement with community leaders and role models.

Conclusions/Next steps: The EYE Universal SRHR Project underscores the importance of holistic, community-driven approaches to improving SRHR outcomes. Moving forward, scaling successful interventions and integrating them into national health systems will be critical. Strengthening partnerships with local governments and stakeholders will ensure long-term sustainability and resilience in health systems, particularly for adolescents and underserved populations.

EP0977

Antiretroviral therapy adherence prediction: a data-driven approach to personalized care

A. Freitas[1], K. Adeshina[2]

[1]Ahmadu Bello University, Public Health, Zaria, Nigeria, [2]Ladoke Akintola University of Technology, Computer Science, Ogbomoso, Nigeria

Background: Adherence to antiretroviral therapy (ART) is critical for the effective management of AIDS. However, factors influencing adherence vary widely and require reliable predictive models for personalized patient care. This study hypothesized that leveraging machine learning (ML) techniques to analyze clinical and demographic features would enhance the predictive accuracy for ART adherence.

The study aimed to develop, evaluate, and interpret machine learning models to classify adherence, identify key determinants, and provide insights into patient management strategies.

Methods: The study utilized data from an AIDS Clinical Trials Group study, incorporating CD4/CD8 counts, demographics, comorbidities, and opportunistic infection history. Derived features like CD4/CD8 ratios and BMI categories were calculated, with categorical variables encoded via one-hot encoding. Data was split 80-20 into training and testing sets, and five machine learning algorithms (Logistic Regression, Decision Tree, Random Forest, XGBoost, and Neural Networks) were implemented to predict ART adherence. Models were evaluated using accuracy, precision, recall and F1-score.

Results:

Models	Accuracy
Logistic Regression	83%
Decision Tree	84%
Random Forest	87%
Neural Network	82%
XGBoost	87%

The Random Forest model, optimized through hyperparameter tuning, achieved the highest accuracy (93%) on the test set, outperforming Logistic Regression (87%), Decision Tree (85%), XGBoost (91%), and Neural Networks (89%). Key predictors identified included baseline CD4/

CD8 ratios, comorbidity scores, and demographic factors such as age and BMI categories. Feature importance confirmed the significance of these predictors in adherence classification. The models were validated through cross-validation.

Conclusions: This study highlights the potential of machine learning algorithms in improving ART adherence predictions. With it's superior accuracy and interpretable feature importance, the Random Forest model provides a reliable tool for healthcare professionals to identify at-risk patients.

These findings underline the importance of integrating machine learning into clinical decision-making for personalized AIDS care. Future research should explore the model's applicability in real-time and its scalability to other chronic disease management scenarios.

EP0978

Organizational readiness and leadership capacity for integrating hypertension care in HIV services in peri-urban and urban Uganda

J. Kiggundu[1,2], F.C. Semitala[3,4,1], S. Mwaka[1], R. Twine[1], M. Muddu[1], J. Kayima[5,3], G. Mutungi[6], D. Spiegelman[7], M. Abdo[7], I. Ssinabulya[8,3], J. Schwartz[9,8], A.R. Katahoire[10], C. Longenecker[11]

[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]Makerere University School of Public Health, Disease Control and Enviromental Health, Kampala, Uganda, [3]Makerere University, Medicine, Kampala, Uganda, [4]Makerere University Joint AIDS Program, Kampala, Uganda, [5]Uganda Heart Institute, Kampala, Uganda, [6]Ministry of Health, Non-Communicable Diseases, Kampala, Uganda, [7]Yale School of Public Health, Biostatistics and Center for Methods on Implementation and Prevention Science (CMIPS), New Haven, United States, [8]Uganda Initiative for Integrated Management of Non-Communicable Diseases, Kampala, Uganda, [9]Section of General Internal Medicine, Yale School of Medicine, New Haven, United States, [10]Makerere University, Medicine, Child Health and Development Centre, Kampala, Uganda, [11]University of Washington, Global Health, Division of Cardiology, Seatle, United States

Background: This study evaluated the organizational readiness and leadership capacity for implementing two integrated HIV-hypertension care models and examined predictors of organizational readiness and implementation leadership among HIV healthcare providers (HCP) in Wakiso and Kampala districts of Uganda

Methods: In a stepped wedge cluster randomized trial (NCT05609513) at 16 HIV clinics assigned to either "BASIC" (basic training, supply of hypertension medications and blood pressure devices) or "PLUS" (all components of BASIC plus enhanced hypertension training, performance feedback and differentiated service delivery for hypertension), we purposively enrolled HCP in an implementation climate study. HCPs completed the validated 12-item organization readiness for implementing change (ORIC; score range 12-60) survey at the start of implementation. After six months, we administered a validated 12-item implementation leadership scale (ILS; overall score range 0-48 with 4 sub-scales scored 0-12) to the same HCPs. Using STATA 14.1, we compared scores between study arms using the Mann-Whitney test and assessed the association between demographics and ORIC/ILS scores using linear regression.

Results: Between March 2023 and August 2024, 43 HCP were enrolled of whom 15 (35%) were clinic leads. Median age was 33.5 years (30-41), 24 (56%) were females. The overall median ORIC score was high [58 (55-60)], with participants in PLUS clinics having slightly higher ORIC [58(57-60) vs. 56 (54-58), p<0.062]. The median ILS score was also higher in the PLUS arm compared to BASIC [38 (34-42) vs. 41(38-45), p=0.079].

Knowledgeable [12 (9-12)] and supportive [11(9-12)] domains were scored higher than proactiveness [9(8-10)] or perseverance [10(9-11)]. Clinic staff at PLUS clinics had significantly higher median scores in the supportive domain [11(9-12) vs 9(8-11), p=0.07].

Male clinic leads tended to have lower leadership scores [Coef: -5.6, 95% CI: 2.3-10.9] at PLUS sites. At BASIC sites, Clinic staff in Kampala had ILS scores 10 points higher than those in Wakiso (CI 0.8-18.8).

Conclusions: The findings show strong organization readiness and adequate leadership for implementing integrated care approaches, though both scores tended to be higher in the clinics implementing the enhanced and more human-resource-intensive PLUS intervention.

Organizations planning integrated care should support this favourable implementation climate and consider efforts to sustain.

EP0979

Meaningful youth engagement in the national response to HIV in Nigeria: an analysis of key national HIV policies

A.E. Bassey[1], A.D. Ibrahim[2], C.D. Nwosu[3]

[1]University of Warwick, Warwick Medical School, Coventry, United Kingdom, [2]Slum and Rural Health Initiative, Ibadan, Nigeria, [3]Coventry University, Faculty of Law and Business, Coventry, United Kingdom

Background: Despite global commitments to meaningful youth engagement (MYE) in the HIV response, youth engagement often remains tokenistic. Nigeria's adoption of the 2021 Political Declaration at the United Nations General Assembly High-Level Meeting on AIDS, presents a timely opportunity to evaluate how three key Nigerian HIV policies incorporate commitments on Meaningful Youth Engagement (MYE).

Methods: We conducted a qualitative document analysis of three key national documents: the National HIV and AIDS Strategic Plan (NSP) 2023-2027, National Strategic Framework (NSF) 2021-2025, and the National Policy on HIV and AIDS (NPHA) 2020. Informed by the Global Consensus Statement on MYE and the advocacy guide on Meaningful Youth Engagement & Youth Leadership, we developed a novel analytical framework tool derived from five key commitments (paragraphs 58, 59, 64, 64a, and 64d in the

2021 Political Declaration) that specifically address youth engagement. Using this framework, we assessed how each policy aligns across the 5 MYE commitment dimensions: stakeholder engagement, accountability mechanisms, GIPA principle implementation, technical and financial support for youth networks, and utilization of youth-generated evidence.

Results: Our analysis revealed variance in the incorporation of MYE commitments across the three policies. The NSP revealed the strongest, albeit partial, incorporation of MYE commitments, showing strong evidence of youth/youth led organizations in the consultation processes for the policy and prioritizing youth leadership.

Nevertheless, it lacked specific implementation mechanisms. The NSF and NPHA showed limited recognition of youth as stakeholders, with no structured frameworks for institutionalized engagement.

Critical gaps were identified across all 5 dimensions in the policies, as young people were predominantly positioned as beneficiaries rather than as active partners and leaders in the HIV response.

Conclusions: Our findings portray systemic gaps in operationalizing MYE in Nigerian HIV policies, underscoring missed opportunities for youth engagement and leadership in the national HIV response. Addressing these gaps will enhance the relevance and efficacy of HIV prevention, treatment, and care, aligning Nigeria's efforts with global commitments to achieve a more inclusive and impactful HIV response.

EP0980

Strengthening HIV health supply chains in Rwanda through data-driven decision making: best practices and lessons learned from 2018-2024

O.N. Wane[1], F.R. Kitema[1], A. Gashaija[1], J.U. Condo[1], E. Habiyambere[2], J.D. Hagenimana[1]

[1]Centre for Impact, Innovation and Capacity Building for Health Information Systems and Nutrition (CIIC-HIN), Kigali, Rwanda, [2]Rwanda Biomedical Centre, Kigali, Rwanda

Background: Rwanda is dedicated to achieving the UNAIDS "95-95-95" targets by 2030, aiming to diagnose 95% of people living with HIV (PLHIV), ensure 95% of diagnosed individuals receive antiretroviral therapy (ART), and achieve viral suppression in 95% of those on ART. This mission requires a reliable supply of HIV-related commodities, such as ARV drugs, test kits, and laboratory supplies. Recognizing the critical role of uninterrupted availability for effective treatment and prevention, Rwanda has strengthened its health supply chains by incorporating data-driven decision-making into procurement, inventory management, and distribution planning.

Description: The HIV program, implemented by the Rwanda Biomedical Center (RBC) in partnership with Rwanda Medical Supply Ltd (RMS), ensured nationwide availability of HIV-related commodities through robust supply chain management from 2018 to 2024. Key activities included annual forecasting and quantification, procurement planning, and inventory monitoring. Tools such as the Integrated Quantification Report, Supply Plan Review Report, and RMS Quality Assurance Annual Report informed decisions. Over six years, interventions ranged from transitioning over 81,000 clients to Dolutegravir-based regimens and training supply chain personnel to introducing laboratory bundling for efficient inventory management and conducting mentorship programs for health facility store managers.

Lessons learned: The program revealed critical insights into supply chain management. Aligning procurement with national treatment guidelines resulted in 100% compliance, ensuring all distributed products met quality standards.

However, challenges such as a forecasting accuracy rate of 58.9% and procurement inefficiencies, with 90% order delivery, highlighted areas for improvement.

Monthly stock reviews and robust inventory controls limited stock-outs and expiries to 2%, surpassing set targets. Nationwide capacity-building efforts strengthened supply chain practices, enabling seamless adaptation to updated treatment protocols.

Conclusions/Next steps: Data-driven decision-making proved instrumental in enhancing the availability and quality of HIV-related commodities in Rwanda, contributing to progress toward the UNAIDS 95-95-95 targets.

Future strategies should prioritize refining forecasting models, improving procurement processes, and maintaining robust inventory controls to ensure consistent access to high-quality HIV prevention, treatment, and care services.

EP0981

Labor landscaping: HIV workforce and training needs - insights from a cross-sectional study in Vietnam

H.T.T. Phan[1], M.D. Pham[1], N.V. Nguyen[1], H.T. Le[1], A.V.T. Nguyen[2], H.K.T. Tran[2], V.T. Nguyen[2], D.M. Levitt[2], H.D. Han[3], M.D. Hoang[3]

[1]Vietnam Administration for HIV/AIDS Control, Hanoi, Viet Nam, [2]FHI 360 Vietnam, Hanoi, Viet Nam, [3]Hanoi Medical University, Hanoi, Viet Nam

Background: Despite substantial progress in HIV epidemic control during the last two decades, Vietnam faces challenges ensuring differentiated HIV service availability, coverage, and quality needed to end AIDS by 2030. Several studies conducted from 2005 to 2014 indicated insufficiencies in the quantity and quality of the health workforce; however, no data exist that characterize the current situation.

With the support of the Meeting Targets and Maintaining Epidemic Control project (EpiC), we assessed health workforce and training needs to design a national workforce development plan.

Methods: This cross-sectional study was conducted from June to August 2024. Quantitative data were collected via an online self-administered questionnaire from 17,168 personnel engaging in HIV prevention and control across 63 provinces at provincial, district, and commune levels. Analysis assessed workforce status and training needs.

In-depth interviews with 71 health care leaders and staff in six provinces representing Vietnam's three regions were thematically analyzed.

Results: Most respondents worked at the commune level (64%) versus district (24%) and provincial (12%) levels. However, 97.8% of commune staff, 75.5% of district staff, and 47.3% of provincial HIV-dedicated staff had cross-functional roles, limiting their capacity for specialized tasks and requiring them to balance HIV with other duties.

At all levels, most staff (81.8%) worked in HIV management, care, and treatment, with fewer working in prevention, communication, testing, counseling, or other areas.

Training opportunities were disproportionately available to provincial and district staff (18.4%) versus commune staff (6.7%) ($p<0.0001$). Respondents identified several learning limitations, including overcrowded and combined sessions and insufficient equipment.

Additional barriers included unclear training regulations, insufficient qualified trainers, varying professional requirements, inadequate trainer remuneration, and financial constraints.

Respondents expressed the need for annual offline training in specialized HIV knowledge, communication, counseling, and updates on new methods.

Conclusions: The findings highlight critical central and provincial roles in developing mechanisms for training and the need to revise training frameworks and guidance, enhance provincial trainer capacity, and provide comprehensive training for Vietnam's HIV workforce.

Tailored training programs for different levels of the workforce are essential to foster a more effective, responsive system that addresses HIV and other health priorities.

EP0982

From beneficiaries to partners: integrating youth power into local health systems in Iloilo City, Philippines through project HIV & AIDS Youth Initiative (HAYI)

J.R. Vijar[1], A. Amon[1], K.J. de los Santos[1,2], J.M. Bordon[1], L. Rynevel[1], A.K. Barbaton[1], S. Christian Jose[1], G. Kent[1]
[1]Team Dugong Bughaw, Inc., Iloilo City, Philippines, the, [2]University of the Philippines Visayas, Division of Biological Sciences, Iloilo, Philippines, the

Background: The Philippines faces a growing HIV epidemic, with nearly half of new cases in 2023 involving individuals aged 15-24 years. In Iloilo City, 34% of newly diagnosed cases fall within this age group. To address this, Team Dugong Bughaw, Inc. launched Project HIV and AIDS Youth Initiative (HAYI), utilizing the peer-to-peer strategy in HIV education, stigma reduction, HIV testing, and referral in Higher Education Institutions (HEIs) and Local Government Units (LGUs) to improve health systems by bridging the gap between service providers and the young key population.

Description: In Iloilo City, Project HAYI targeted youth in HEIs, focusing on HIV awareness and prevention through boot camps, peer-to-peer education, the establishment of school-based reproductive health corners ("The Nook"), and partnerships with HEIs and LGUs. The project was bolstered by public-private partnerships, referral networks, and the piloting of Community-Led Monitoring (CLM).

Lessons learned: Project HAYI achieved significant outcomes, including:

- Educating 11,524 students on HIV (significant increase in post-test scores $p<0.001$).
- Dispensing 9,796 condoms, 1,436 lubricants, and testing 909 individuals for HIV.
- Signing Memoranda of Understanding (MOUs) with five HEIs to support HIV awareness programs, establish "The Nook," and create school-based organizations
- Securing a ₱5.5-million commitment from Iloilo City government to boost HIV investments.
- Establishing referral networks with five treatment hubs and piloting CLM in two health institutions.

Challenges included resistance from HEIs due to conservative views, bureaucracy, and the transient nature of student populations. Community mobilization efforts faced risks of political co-optation and short-term partnerships.

Lessons learned emphasize the importance of baseline data assessments, realistic goals, inclusive targeting, strategic program integration, and robust monitoring and evaluation for sustainable and impactful HIV programs.

Conclusions/Next steps: These findings underscore the capacity of young people to significantly advance HIV awareness, prevention, and care in resource-limited settings by integrating youth-focused approaches into local health systems.

Integrating HIV education into academic curricula, normalizing HIV testing among young people, institutionalizing CLM at the national level, and advocating for an HIV-dedicated LGU budget beyond Gender and Development (GAD) funds will ensure a sustained HIV response in Iloilo City.

EP0983

Partnerships with purpose: expanding economic opportunities for Rwandan AGYW in the DREAMS program

E. Ndengo[1], K. Plourde[2], J. Galaris[1], J. Wolfe[2], E. Niyonsaba[1]
[1]United States Agency for International Development, Kigali, Rwanda, [2]United States Agency for International Development, Office of HIV/AIDS, Washington, DC, United States

Background: Adolescent girls and young women (AGYW) in Rwanda face a heightened risk of HIV infection, with an estimated prevalence of 3.7%. Among YW aged 20–24, the risk of new acquisition is five times higher than that of their male counterparts. Economic inequality is a significant driver of HIV vulnerability in this population. Financial independence and access to economic opportunities can mitigate risk-factors, such as dependence on partners or engaging in transactional sex to meet basic needs.

Consequently, economic strengthening has become a critical component of a multi-faceted HIV combination prevention strategy for AGYW.

Description: Comprehensive economic strengthening is a cornerstone intervention within the PEPFAR DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe) program in Rwanda. Since its inception in Rwanda in 2018, the program has reached 163,236 AGYW with this intervention. Participants frequently cite economic strengthening as a key motivator for their involvement and completion of the program.

However, implementers highlight the high cost of delivering well-designed economic strengthening interventions as a barrier to broader reach and sustainability.

To address these challenges, USAID Rwanda has developed innovative partnership strategies to

1. Expand the reach of economic strengthening activities within the comprehensive HIV prevention program and;
2. Support long-term sustainability.

Key partnerships have been established with organizations such as the MasterCard Foundation, BRAC International, the Bank of Kigali Foundation, and various local private sector partners.

Lessons learned: The partnership approach has generated several valuable insights that enhance the implementation and sustainability of economic strengthening interventions within the DREAMS program. Key findings highlight the significance of aligning objectives among stakeholders and the necessity for established safeguarding measures.

Additionally, the benefits of conducting landscape and stakeholder analyses, effective methods for engaging the private sector, and strategies for monitoring and evaluating participant progress across various partners are also emphasized.

Conclusions/Next steps: Rwanda's experience provides a practical framework for engaging diverse partners and highlights the role partnerships can play in ensuring the sustainability of economic strengthening interventions.

These learnings offer significant implications for DREAMS and other multi-component HIV prevention programs, enabling them expand reach and enhance the sustainability of this critical component for reducing HIV vulnerability among AGYW.

EP0984

Augmenting access to and utilization of HIV services in the year 2022 through Community Led Monitoring (CLM): a pilot initiative in three northeast states of India

B. George[1], R. Haobam[2], L. Lalthlengliani[3], A. Sekhose[4], U. Bhanu Das[5], I. Madan[5], B. Rao[5], D. Bridger[6], N. Kapoor[6], S. Edwin[6], T. Imlong[1], S. Sharma[1], R. Kumar[1], S. Chawla[7], U. Sharma[7], S. Upadhyaya[7], P. Nadol[7]

[1]Family Health India, New Delhi, India, [2]Manipur State AIDS Control Society, Imphal, India, [3]Mizoram State AIDS Control Society, Aizawl, India, [4]Nagaland State AIDS Control Society, Kohima, India, [5]National AIDS Control Organization, New Delhi, India, [6]UNAIDS, New Delhi, India, [7]U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, New Delhi, India

Background: Community-led monitoring (CLM) is critical to understanding availability, access, utilization of HIV services, and barriers associated with service delivery. A pilot program of beneficiary interviews through community representatives was implemented during June-Dec 2022 to assess the service user experience in 145 public health facilities of 15 districts of Manipur, Mizoram, and Nagaland states, India.

Description: State Community Resource Groups were established, and State/District-level consultations and sensitization workshops were conducted with key community members and stakeholders. To interview the beneficiaries accessing HIV prevention, testing and treatment services at selected facilities, community consultants (n=56) were selected from among service providers, community-based organizations, Community champions and community networks based on a landscape analysis.

Responses of 1,399 beneficiary interviews were analyzed to assess their experience of local facilities in terms of availability, accessibility, appropriateness, responsiveness to client reasonable expectations, and satisfaction, and scored in each category.

Based on the average performance of their facilities, districts were categorized ordinally as: Red ("Alert"): 0 20%, Orange ("Work in progress"): 21 40%, Yellow ("Getting there"): 41 60%, Blue ("Above average"): 61 80%, and Green ("5-star facility"): above 80%.

Lessons learned: Of 15 districts, 11 (73%) were graded as "5-star facilities" for availability, followed by 9 (60%) for overall satisfaction, 8 (53%) for accessibility and appropriateness, and 7 (46%) for responsiveness". Satisfaction with HIV services in all districts scored "Above average" or "5-star facility". Major gaps were in accessibility of HIV services and responsiveness of service providers. The district- and facility-specific score cards were further shared with district and facility managers to address the identified gaps. Provisioning of commodities, feasibility assessment, sensitization of key stakeholders, and regular trainings ensured improved HIV service delivery.

Conclusions/Next steps: This exercise provided valuable evidence on the effectiveness of HIV service delivery from the beneficiaries' perspectives and led to appropriate actions to improve the HIV services. This model was an effective system for feedback from communities, to

recommend improvements and acknowledge the good practices and has been scaled up across the country. Periodic implementation of CLM may be considered for evidence-informed and community-friendly solutions to improve HIV services.

EP0985

Enhancing HIV data and service quality assessments through mobile technology in Kenya (2021 - 2024)

J. Ngugi[1], N. Ongeri[1], B. Nyamota[1], C. Oburu[1], P. Muange[1], D. Nyaga[1], G. Olago[1], A. Nyandigisi[1], V. Kimathi[2], D. Kimanga[3], E. Muthama[3]
[1]Health Strat, Nairobi, Kenya, [2]Ministry of Health, National AIDS and STI Control Program (NASCOP), Nairobi, Kenya, [3]U. S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Nairobi, Kenya

Background: Effective data management enhances service delivery and health outcomes. Kenya's National AIDS and STI Control Programme (NASCOP) developed a mobile application for Android and iOS to improve data and service quality assessments (DSQAs) across the healthcare system to support the national HIV program. The application is now widely adopted by the Ministry of Health (MOH), facilitating quality assessments at national, county, sub-county, and facility levels. Currently, over 2,000 users actively use the tool.
Description: This application supports routine and national assessments with real-time data collection, validation, and reporting, enabling longitudinal tracking and ensuring data accuracy, consistency, and reliability. Key features include team management, guided questionnaires, and integration with national data systems like the Kenya Health Information System, National Data Warehouse, and Data for Accountability, Transparency and Impact (DATIM), allowing cross-system data comparisons. Built-in dashboards enable immediate visualization for timely decisions, and automated facility reports serve as reference documents. Its customizable design allows adaptation for specific program needs. An automated action planning module promotes accountability, with teams able to record improvement areas, assign responsibility, and set deadlines for follow-up.
Lessons learned: Implementation has improved data accuracy and timeliness, enabling health facilities to identify and correct data queries, reduce discrepancies, and ensure accurate representation of service delivery indicators. Linkage to the National HIV dashboard provides visibility into conducted assessments. NASCOP and MOH routinely support ongoing training and technical assistance, promoting adoption and reliable performance, showcasing Kenya's commitment to digital health solutions. The application has standardized and reduced the time taken to conduct DSQAs, saving the program approximately $30,000 that would have otherwise been spent on vendors to conduct national-level DSQAs.
The application's relevance was evaluated based on stakeholder feedback regarding adoption, usefulness, ease of use, alignment with reporting needs, and key benefits. About 70% of respondents reported using the application, with frequent users praising its ability to deliver reliable data and support strategic decisions.
Conclusions/Next steps: Kenya's adoption of this solution offers a scalable model for other low- and middle-income countries, showcasing how digital health innovations improve data quality and service delivery while aligning with global best practices and sustainable healthcare goals.

EP0986

Ensuring access to essential HIV medicines, strengthening workforce capacity, and driving innovation

L.M. Ngaruiya[1], J. Asin[1]
[1]Ecumenical Pharmaceutical Network, Programs, Nairobi, Kenya

Background: The Ecumenical Pharmaceutical Network (EPN) launched an ongoing project (2022–2028) to improve pharmaceutical services in rural, underserved communities across five African countries: Cameroon, Lesotho, Zambia, Tanzania, and Kenya. The lack of skills among non-trained staff in commodity control has compromised the consistent availability of essential medicines, particularly in faith-based health centres located in regions with poor infrastructure, remote locations, and conflict zones. Targeting 100 church-managed primary care centres operating outside government systems, the project addresses gaps in specialized staffing and commodity access.
The initiative aims to enhance pharmaceutical systems by improving commodity management, particularly for HIV treatments such as antiretrovirals (ARVs) and prophylaxis for opportunistic infections.
Description: The program targeted faith-based centres with limited government support. It trained non-specialist healthcare workers in inventory management, stock monitoring, and procurement. A medicines availability tool was introduced to:
1.Track stock levels.
2.Guide restocking.
3.Address shortages proactively.
Facility committees used the tool to make data-driven budget and resource allocation decisions. Key metrics tracked included current stock, safety stock, average monthly consumption, lead time, maximum stock, procurement periods, stock on order, and supply sources. Priority was given to first-line ARVs (ABC/3TC), Nevirapine, Cotrimoxazole (CTX), and Hydrochlorothiazide (HCTZ) for aging HIV patients in rural areas.
Lessons learned:
1. Improved Medicine Availability: Availability of 14 essential medicines, including Abacavir and Lamivudine, improved in 6 out of 20 rural facilities in Cameroon compared to 2022.
2. Proactive Stock Monitoring: The tool reduced stock-outs by enabling staff to resolve supply challenges.
3. Capacity Building: Training improved pharmaceutical system management and responsiveness to community needs.

4. System Strengthening: Continuous monitoring enhanced supply chain resilience and ensured timely medicine availability.

Conclusions/Next steps: This ongoing project highlights the importance of leveraging innovation to optimize processes and adapt practices to the unique challenges of rural and hard-to-reach areas. Tailored tools and training ensure the consistent supply of essential commodities, strengthening the management of HIV and related ailments. As the initiative progresses from 2022 to 2028, continued monitoring will provide insights to sustain and scale these improvements in underserved communities.

EP0987

Leveraging routine health facility data for HIV research in refugee settlements: a focus on data quality and insights beyond randomized trials

R. Nsubuga[1], G. Asaba[1], A. Mugyeni[1], R. Klabbers[2,3], A. Kiragga[4,1], T. Muwonge[1], A. Mujugira[1,3], K. O'Laughlin[2,3]

[1]Infectious Diseases Institute, Makerere University, Department of Research, Kampala, Uganda, [2]University of Washington, Department of Emergency Medicine, Seattle, United States, [3]University of Washington, Department of Global Health, Seattle, United States, [4]African Population and Health Research Center, Data Science, Nairobi, Kenya

Background: Routine health information systems used in health facilities generate data to track health service delivery including HIV. While randomized clinical trials are considered the gold standard for evaluating causal effects due to their controlled environments, routine facility data often lack such control and are underutilized due to quality challenges. Electronic health records (EHR) offer promise but are rarely used in real-time, often serving mainly for end-of-month reporting. We explored the quality of routine facility data in addressing clinical trial research outcomes.

Methods: We utilized data from Data-Quality-Assessment (DQA) field visits of a cluster randomized clinical trial aimed at evaluating the effect of community ART delivery models on viral suppression among persons newly diagnosed HIV at 12 health facilities across five refugee settlements in Uganda (R01MH130216). Trained research assistants extracted data from facility registers or EHR and entered into a mobile-Research Electronic Data Capture (REDCap) database.

Monthly DQA visits entailed cross-validating REDCap with register data and documenting challenges to data quality. Notes from DQA visits were reviewed to assess data accuracy (REDCap versus register), missingness and timeliness (REDCap time stamp versus register dates) of the clinical trial outcomes of viral load assessment and community model placement.

Results: From January-15, 2024, we enrolled 662 clients (314-Intervention and 348-Control). We reviewed 662 records; 399 for Viral-Load assesments and 203 for community placements.

Accuracy: REDCap and register data were generally consistent. Discrepancies existed in the viral load appointment register, primarily due to differences in how the timing for Viral-Load assessment was computed, hence mismatches. Facilities that utilized the Electronic Monitoring Record (EMR) had more accurate records and viral load tracking.

Missingness: This was common in the community group registers; most missed entries were: group-codes, date of group formulation and number of clients per group.

Timeliness: In early study stages, mismatches between REDCap time stamp data and dates recorded in registers affected study inclusion criteria.

Conclusions: Routine health facility data quality was generally accurate, especially when EHR were utilized; however, missingness and delays in entry existed. Implementing electronic systems and staff training may address data quality issues and enhance their utility for robust clinical research.

EP0988

Expanding HIV service in public hospitals through community-involved strategies to enhance access, case finding, and same-day treatment for key populations

N. Patpan[1,2], A. Wongsa[3], O. Thienfaidee[1], J. Moonnamang[4], T. Sangpasert[5], S. Saiwaew[5], R. Janamnuaysook[3], S. Mills[6], N. Phanuphak[3], R.A. Ramautarsing[3,3]

[1]Ratchaphiphat Hospital, Internal Medicine, Bangkok, Thailand, [2]Chiangmai University, Chiangmai, Thailand, [3]Institute of HIV Research and Innovation, Bangkok, Thailand, [4]Ratchaphiphat Hospital, Bangkok, Thailand, [5]Rainbow Sky Association of Thailand (RSAT), Bangkok, Thailand, [6]USAID Epic Project, FHI 360, Bangkok, Thailand

Background: HIV remains a significant problem in Thailand, with an estimated 580,000 people living with HIV in 2023. HIV testing and treatment are easily accessible in public hospitals, but key populations still face social and economic barriers which hinder their access to essential healthcare services. To address those challenges, we developed a community-led same day antiretroviral therapy (CL-SDART) program.

Description: Ratchaphiphat Hospital (RPP), a tertiary care hospital in Bangkok, collaborated with Rainbow Sky Association of Thailand (RSAT) to implemented CL-SDART. Trained lay providers from key populations provide HIV screening, testing, and SDART initiation at RSAT's clinic, under supervision of a medical team from RPP. Physicians from RPP prescribed ART for all newly diagnosed clients within one day. We compared HIV-related data from January 2023 – October 2024 between CL-SDART clients and clients from regular HIV services at RPP.

Lessons learned: Through regular services at RPP, 226 clients with a median age of 33 (interquartile range, IQR 25-43) years were newly diagnosed with HIV during the study period. One-third (33.3%) were heterosexual men, 33.3% were cisgender women, and 33.3% men who have sex with men. Median (IQR) CD4 at diagnosis was 202.0 (44.5-387.0) cells/mm^3, and 36.3% (82/226) of clients had CD4 <100 cells/mm^3.

Furthermore, cryptococcal antigen and syphilis positivity were 6/226 (2.7%) and 40/226 (17.7%), respectively. Through CL-SDART, 288 clients with a median age of 27 (IQR 23-31) years were newly diagnosed with HIV, of whom 83.7% identified as men who have sex with men. Median CD4 count was 414.0 (299.8-554.8) cells/mm^3. No CD4 <100 cells/mm^3 or cryptococcal antigen positivity were observed. Syphilis positivity was 117/288 (40.6%).

CL-SDART has been particularly effective in engaging young people and key populations, especially men who have sex with men.

Additionally, HIV testing in a community-led clinic facilitated earlier detection of HIV with higher initial CD4 counts (p<0.001), enabling prompt interventions which will contribute to improved patient outcomes.

Conclusions/Next steps: These findings emphasize the effectiveness of CL-SDART in improving accessibility for key populations and facilitating early HIV diagnosis.

Expanding this approach across multiple sectors could help address barriers to accessing HIV-related services and improve service delivery.

EP0989

Factors affecting the provision of client-centered HIV care in central Uganda: a qualitative study with HIV care providers, staff, and community partners

A. Anecho[1], R.K. Wanyenze[1], S.L. Dworkin[2], S. Vermund[3], R.L. Luttinen[4], K. Weston[4], S.C. Mukama[5,6,7], B.S. Taylor[8], J.F. Dovidio[9], T.S. Kershaw[9], K.M. Sileo[10,4]

[1]Makerere University School of Public Health, Kampala, Uganda, [2]University of Washington Bothell, Bothell, United States, [3]University of South Florida, Tampa, United States, [4]University of Texas at San Antonio, San Antonio, United States, [5]Infectious Diseases Institute, Kampala, Uganda, [6]Mash Research Africa, Kampala, Uganda, [7]Mildmay Uganda, Kampala, Uganda, [8]Joe R. & Teresa Lozano Long School of Medicine, UT Health San Antonio, San Antonio, United States, [9]Yale University, New Haven, United States, [10]Boston College, Chestnut Hill, United States

Background: Client-centered HIV care is a priority of HIV organizations globally (care that meets the needs of diverse individuals through convenience, welcoming environments, supportive services, and community engagement). In sub-Saharan Africa, the provision of client-centered care is uniquely challenging and understudied.

This study sought to explore factors affecting the provision of client-centered care in HIV clinics in central Uganda.

Methods: In 2023, we conducted a qualitative study with health workers and community partners in six health facilities across three districts in Uganda to shed light on factors affecting the provision of client-centered care. We conducted 7 focus group discussions (n=53 health workers, lay health workers, staff), and 12 key-informant interviews with community partners (e.g., district and HIV program leaders). We used thematic analysis and the social ecological model to interpret our results.

Results: At the individual-level, providers were aware of client centered care's principles but acknowledged that its perceived importance and implementation was low. At the interpersonal-level, health and lay workers expressed bias towards groups of clients (e.g., sex workers, MSM, young women) that interfered with their provision of client-centered care. Other barriers to being client-centered expressed by providers included a lack of empathy towards clients with a detectable viral load, an unwillingness or inability to self-regulate stigma towards clients, and a desire to keep personal boundaries with clients.

At the health system-level, while health leaders discussed client-centered care as a priority, clinic-level barriers limited implementation, including a lack of private space for counseling, limited time per client due to heavy client load, work-load related stress affecting their interactions with clients, and a "one-size-fits-all" approach to group rather than individualized counseling. Participants agreed about the need for more training and institutional support to strengthen the implementation of client-centered care.

Conclusions: While aware of the tenets of client-centered care, HIV care providers experience multilevel barriers to its implementation. Health worker training is needed that builds knowledge, motivation, and skills to provide client-centered HIV care, and addresses stigma to reduce provider bias. However, such approaches need to consider structural challenges in health settings such as Uganda that impede the provision of client-centered care.

EP0990

Community-Based pharmacovigilance: a novel approach to improve adverse drug reactions documentation and reporting for better HIV treatment outcomes in Zambia

H. Fomundam[1], A. Tesfay[1], A. Maranga[1], C. Maxwell[2], M. Mando[3], K. Chitiya[3]

[1]Howard University, Howard University Global Initiative, South Africa (HUGISA), Pretoria, South Africa, [2]Howard University, College of Medicine, Washington, United States, [3]Howard University International Zambia, Lusaka, Zambia

Background: Adverse Drug Reactions (ADRs) are known to affect clients' adherence and continuity in treatment. Pharmacovigilance in Zambia has traditionally focused on clinical settings, with limited community involvement. To address this gap, Howard University implemented innovative strategies to enhance ADRs reporting from the community as an important resource in contributing to client safety and improved treatment outcomes.

The primary objectives of this initiative are to enhance and optimise community participation in ADRs reporting, develop integrated pharmacovigilance systems, and improve treatment outcomes.

Methods: Three key interventions were employed to achieve these goals from 2020 to 2024.

- **Community Reporting through Monthly Check-in Calls:** We established regular check-in calls to facilitate ADRs reporting and foster collaboration between healthcare professionals and community health workers.

- **Sensitization via Expert client Groups:** Expert clients, using peer-to-peer communication, provided essential education on ADRs and reporting procedures, particularly during the COVID-19 pandemic.
- **Integration with Neighbourhood Health Committees (NHCs):** Educational sessions were organized with NHCs to promote ADRs reporting and safe medication use within the community.

Results: The initiative led to several positive outcomes:

- Community-based ADR reporting now accounts for 20% of all ADRs reported.
- A reduction in ADRs occurrence reporting time from six months to one month, enabling timely interventions and improving health outcomes.
- Sustained 99% Viral load suppression indicates an absence of adherence issues particularly due to ADRs.
- A high treatment continuity rate of 98% suggests that ADRs did not lead to significant client dropout
- Only < 0,5% missed doses associated with ADRs.

Conclusions: The interventions implemented by Howard University demonstrate effective strategies for enhancing client safety through community-based pharmacovigilance. By engaging local communities in ADRs reporting and promoting a proactive reporting culture, the project has improved pharmacovigilance practices and client care. This model offers valuable lessons for other regions, emphasizing the importance of community involvement in safeguarding public health and ensuring medication safety.

This project was funded by the Health Resources and Services Administration (HRSA) under the U.S. President's Emergency Plan for AIDS Relief, as part of the Historically Black Colleges and Universities (HBCU) Global Health Consortium (GHC) Initiative.

EP0991

Advancing youth-friendly health services through systematic strengthening

I. Engelbrecht[1], V. Trivella[1], V. Mpongoma[2], J. Moruri[3], M. Mokoatle[1], P. Matyanga[4], V. Chitiyo[4], A. Plowright[5], S. Tenza[6]

[1]Right to Care NPC, Privately-funded Programmes, Centurion, South Africa, [2]Right to Care NPC, Privately-funded Programmes, Polokwane, South Africa, [3]Right to Care NPC, Privately-funded Programmes, Rustenburg, South Africa, [4]Zvandiri, Harare, Zimbabwe, [5]Anglo American, Community Health and Wellbeing, London, United Kingdom, [6]Anglo American Corporate South Africa, Community Health and Wellbeing, Johannesburg, South Africa

Background: The Zvandiri model, implemented through the Community Health and Wellbeing Programme (CHWP), represents a public-private partnership between Anglo American (AA) and Right to Care (RTC). Targeting peri-mining communities in Limpopo, North West, and the Northern Cape provinces of South Africa, a novel approach was introduced during the South African implementation. Intensive health system strengthening efforts were undertaken before rolling out the peer-provider support component to ensure facilities were equipped to deliver adolescent and youth-friendly services (AYFS) and ready to integrate peer-providers.

Description: From 2023 to 2024, health system gaps in AYFS delivery were addressed to create an enabling environment for the Zvandiri model's peer-provider implementation.

This preparatory phase focused on capacity building for healthcare providers, strengthening clinic governance with youth representation, and improving compliance with AYFS standards in the Ideal Health Facility Realization and Maintenance (IHFRM) framework.

Lessons learned: The preparatory health system strengthening approach significantly improved facility readiness for AYFS delivery. Compliance with AYFS standards improved from 49% in 2022 to 91% in 2024. Key achievements included the integration of AYFS training into staff development plans, which increased from 31% in 2022 to 80% in 2024, and the inclusion of youth representation in clinic committees, which rose from 26% in 2022 to 69% in 2024. These advancements were critical in supporting the successful rollout of the peer-provider model.

The introduction of the ART child viral load suppression (VL) element into the IHFRM framework in 2023 further aligned clinical outcomes with facility standards. By 2024, the number of supported facilities achieving the South African Annual Performance Plan (APP) target of 45% viral load suppression in children below 50 copies/mL rose to 71%.

However, the APP target remains significantly below the UNAIDS 2030 goal of 95% viral load suppression, further highlighting the need for continued improvement.

Conclusions/Next steps: Targeted system strengthening before implementing the peer-provider component in the Zvandiri model has enhanced uptake and ensured successful outcomes.

This highlights the vital role of system strengthening in enabling novel interventions and underscores the importance of expanding youth-focused initiatives, aligning with global frameworks, and improving clinical monitoring to bridge healthcare gaps and sustain long-term outcomes.

EP0992

Improving healthcare experiences: evaluating the perception of health care workers in some Nigerian States

H. Bello Raji[1], O. Adebayo[1], O. Adetola[2], M. Bathnna[3], C. Oga-Omenka[4], E. Kwasi Armah-Ansah[4], E. Vincent[1], U. Ugwoke[1], O. Ajayi[4], V. Nnamani[2], L. Ekpere[2], K. Nzeadibe[1], U. Atoi[1], B. Pillatar[1], E. Okpokoro[3], O. Olupitan[1], A. Agbaje[1], C. Mensah[5], P. Dakum[6], N. Workneh[7], J. Kimeu[7], K. Tsujii[7], M. Zamzu[7], J.-. Nouboussi[7]
[1]Institute of Human Virology Nigeria (IHVN), Program Coordinating Unit (PCU), GF-NTHRIP, Abuja, Nigeria, [2]Seamhealth Innovations, Abuja, Nigeria, [3]Institute of Human Virology, Nigeria IHVN, International Research Centre of Excellence,, Abuja, Nigeria, [4]School of Public Health Sciences, University of Waterloo, Waterloo, Canada, [5]Institute of Human Virology Nigeria (IHVN), Office of the COO, Abuja, Nigeria, [6]Institute of Human Virology Nigeria (IHVN), Office of the CEO, Abuja, Nigeria, [7]The Global Fund to Fight AIDS, Tuberculosis and Malaria, Global Health Campus, Geneva, Switzerland

Background: Client satisfaction is a critical indicator of healthcare quality and adherence to antiretroviral therapy (ART), essential for achieving the third "95" UNAIDS target. However, client satisfaction across the HIV care continuum in Nigeria remains underexplored. The Institute of Human Virology Nigeria (IHVN) conducted a pilot Client satisfaction survey using a mobile application and web platform to address this gap.
We aim to evaluate insights into healthcare workers' perspectives on the intervention.
Methods: A cross-sectional descriptive study was conducted in 40 high-volume healthcare facilities in Kwara, Gombe, Anambra, and Ebonyi states in Nigeria to evaluate healthcare workers (HCWs) experience following a pilot mobile and web-based Client satisfaction survey. This survey was conducted in January 2025 using a google form questionnaire. Binary questions, Likert-scale items, and open-ended prompts were deployed to HCWs across all participating health facilities. Quantitative data were analyzed using descriptive statistics with Microsoft Excel, while qualitative responses were evaluated through thematic content analysis.
Results: A total of 41 healthcare workers participated in the survey. Of these, 41.2% rated the Clientshot tool as effective in improving healthcare service delivery, 32.1% as very effective, and 14.5% as neutral. Additionally, 63.2% reported significant motivation improvements due to client feedback, while 24.4% noted slight improvements. The majority of healthcare workers agreed that the feedback accurately captured Clients' experiences, leading to notable service improvements, including reduced waiting times through workflow adjustments and improved healthcare worker attitudes. Reported challenges included technological barriers such as the application lag, poor network connectivity, low client literacy levels, and client impatience during survey completion.
Conclusions: This study highlights the potential of digital tools like Clientshot to enhance healthcare services, improving worker attitudes, wait times, and service flow. Addressing technological barriers, device access, and client engagement is essential for scaling impact and strengthening HIV care to advance toward achieving the third "95" UNAIDS target

EP0993

Adapting person-centred care models to public health system realities: lessons from the design and piloting of a person-centred care model in eight rural and peri-urban public clinics in South Africa

L. Rambally-Greener[1], A. Jim[2], H. Ngubane[2], S. Malone[1]
[1]Population Services International (PSI), HIV/TB, Johannesburg, South Africa, [2]Population Services International (PSI), HIV/TB, Durban, South Africa

Background: Person-centred care (PCC) models can improve client outcomes but often face barriers to implementation within the public health system, including an unfavourable enabling environment and limited provider engagement. In partnership with eight public clinics in KwaZulu-Natal, South Africa, this study aimed to design an acceptable, feasible, scalable PCC model that enhances provider motivation and quality of care. (This abstract focuses on lessons from the design process, rather than pilot results.)
Description: Through observations in the pilot facilities and interviews with 35 nurses, we identified factors affecting provider attitudes and behavior, including stress management, communication skills, and team dynamics. These insights informed a series of co-creation workshops focused on designing a PCC model tailored to their needs. The model was piloted over 18 months and refined through structured feedback mechanisms, including surveys, interviews, and focus group discussions.
Providers prioritised topics of empathy, communication, mental health/stress management, teamwork, and supportive supervision as enablers of person-centred care. They preferred training to be delivered via brief, on-the-job sessions open to the full team, rather than full-day, off-site, cascade-style trainings, and focused on practical knowledge and skills. They further suggested that training be accompanied by supportive (rather than audit-based) mentoring and coaching, providing the opportunity to practice and receive constructive feedback on new knowledge and skills. During piloting, providers then proposed various iterations to the model, primarily for feasibility.
Lessons learned: Inclusion of providers in the design, testing, and adaptation of the model contributed to high levels of acceptability and feasibility, with most providers from pilot facilities participating consistently in training and mentoring. Provider feedback on the content and delivery of the model, collected via surveys, interviews and focus group discussions, was also overwhelmingly positive.
Conclusions/Next steps: Employing a participatory approach to the design of PCC models and tailoring them to the specific needs and realities of providers within the public health system may increase feasibility and accept-

ability, contributing to improved provider engagement and motivation. The study highlights the importance of context-specific adaptations and provider engagement in the successful implementation of PCC in resource-constrained settings, offering valuable insights for scaling similar models in other public health systems.

EP0994

Barriers and facilitators in reporting adverse drug reactions among healthcare workers and people living with HIV on antiretroviral therapy in Moshi

N. Emmanuel[1], L. Masika[1], B. Mtesha[1], M. Sumari[1]
[1]*Kilimanjaro Clinical Research Institute, Data Management Unit, Moshi, Tanzania, the United Republic of*

Background: HIV/AIDS is still a major cause of death globally. At the end of 2023, about 39.9 million people were living with HIV (PLHIV) and more than two-thirds of them live in Sub-Saharan Africa. Antiretroviral Therapy (ART) as a treatment has proven to be enough and efficient in the improvement of the health of PLHIV and has reduced mortality, morbidity and onward transmission of HIV. With the increase in ART use is an increase in Adverse drug Reactions which can affect the quality of life of PLHIV and can lead to them stopping their medication.
Although these ADRs and effects caused by ADRs are common and have serious consequences for both the patients and the health system, there is still a big problem with reporting the ADRs
Methods: A cross-sectional study using qualitative methods was used. In-depth interviews (IDIs) and focus group discussions (FGD) were conducted among HCW and PLHIV. The study was conducted in two phases:
Phase 1 involved in-depth interviews with healthcare workers and PLWH, and Phase 2 involved focus group discussions with PLHIV. The data was analyzed using thematic analysis.
Results: The study identified different barriers faced by both healthcare workers and PLHIV on ART. These barriers included limited knowledge of ADR and ADR reporting, inadequate skills for reporting ADRs, lack of feedback from regulatory authorities, not knowing what to report, complicated forms and unavailability of ADR reporting forms. The PLHIV faced barriers like not knowing when to report, not being sure if it is the medication causing the ADR, lack of time, lack fare to come to the clinic and stigma. Facilitators mentioned include training healthcare workers, ensuring timely feedback, and increasing awareness about ADRs and ADR reporting practices.
Conclusions: The study highlighted barriers and facilitators for reporting ADRs among both healthcare workers and people living with HIV on ART. Addressing these barriers will improve healthcare services and the pharmacovigilance (PV) system in Tanzania.

EP0995

Improving HIV outcomes: measuring verification testing, confidentiality, and key population engagement in Zimbabwe, 2024

H.D. Mugauri[1], G. Ncube[1], I. Chikondowa[1], C. Dube[1], C. Gwanzura[1], T. Apollo[1], O. Mugurungi[1]
[1]*Ministry of Health and Child Care, Head Office, AIDS & TB Programme, Harare, Zimbabwe*

Background: In Zimbabwe, timely HIV verification testing and maintaining confidentiality in healthcare facilities are ongoing challenges. Additionally, involving key population (KP) community members in designing and delivering health services is crucial for better health outcomes.
This evaluation assessed these aspects at selected facilities across Zimbabwe, focusing on adherence to national HIV guidelines, enhancing confidentiality at service points, and engaging KP members in health service planning and implementation. Addressing these issues is vital for improving care quality and health outcomes for KPs.
Description: This cross-sectional evaluation was conducted at 148 purposively sampled healthcare facilities across Zimbabwe. Data were gathered using structured questionnaires and facility record reviews, with a focus on the timeline of HIV verification testing, privacy in service delivery points, and community engagement in health services. Quantitative analysis determined percentages of HIV verification testing, privacy design, and KP community involvement, alongside the use of disaggregated data for training and quality improvement (QI). Descriptive statistics were computed using Excel templates for analysis.
Lessons learned: The evaluation revealed several key findings. Firstly, 98.21% (145 out of 148) of the facilities adhered to HIV verification testing protocols, with the majority of tests being conducted on the same day as the initial positive results.
Secondly, privacy (both auditory and visual) and confidentiality were ensured at 89.36% (132) of the service delivery points across the facilities. Additionally, community engagement was significant, with 52.48% (78) of the facilities actively involving KP members in the design and provision of health services. Lastly, 53.9% (80) of the facilities were proactive in collecting, analyzing, and utilizing disaggregated data for training and quality improvement.
These insights highlight the importance of adherence to protocols, ensuring privacy, engaging the community, and leveraging data for continuous improvement in healthcare delivery.
Conclusions/Next steps: The evaluation revealed high adherence to HIV verification protocols and substantial efforts to ensure privacy and confidentiality in health service delivery. Engaging KP community members proved vital for effective interventions.
Enhancing community involvement and utilizing data-driven strategies are recommended to further improve healthcare outcomes for KPs. Ongoing focus on privacy, community participation, and data use is essential for a comprehensive and effective health service system in Zimbabwe.

EP0996

Exploration of scientific evidence and community perspectives on the role of artificial intelligence in Ending AIDS as a public health threat

S. Beckett[1], A. Feizzadeh[2], G. George[1], R. Hirve[2], D. Mattur[2], R. Montgomery[3], D. Ocheret[2], I. Regien[2], A. Valeriano[2]
[1]University of KwaZulu-Natal Westville Campus, HEARD, Durban, South Africa, [2]UNAIDS, Geneva, Switzerland, [3]Robin K. Montgomery Consulting, Ottawa, Canada

Background: Artificial Intelligence (AI) is transforming healthcare, offering new opportunities to enhance HIV prevention, treatment, and care. To maximize its potential in the HIV response, ethical considerations, equity, and community engagement must be prioritized.
This study aims to identify evidence gaps, explore community perspectives, and recommend pathways for applying AI in Ending AIDS as a public health threat.
Methods: This global study is conducted in two phases:
1. A scoping review focusing on the application of generative AI and machine learning in HIV prevention, treatment, response planning and financing, and;
2. Consultations with global networks of PLHIV and key populations on AI opportunities and risks, particularly concerning human rights, equity, and community leadership.
Results: In July-September 2024, a scoping review analyzed 1,439 records, with 1,222 included for full-text review on AI applications in HIV prevention, treatment, and health system strengthening. Of the 1,222 records screened, 182 were selected for analysis. The majority (85%) of studies were original research, more than 92% utilized machine learning and more than half focused on HIV treatment.
The review highlighted AI application in health financing including governance, predicting costs, detecting fraud, optimization financial pooling, improving efficiency and streamlining strategic purchasing. It revealed a paucity of research on human rights issues, equity concerns, ethical, legal, and regulatory issues, data governance, and accountability mechanisms, and community and civil society input.
While the results of consultations are due in February 2025, stakeholder interviews show community-led HIV service providers are hopeful AI will increase access to counseling, including on PrEP and harm reduction, and in fundraising. However, concerns exist about poor access to advanced technology among smaller networks, and confidentiality issues for criminalized key populations.
Conclusions: AI offers transformative potential to revolutionize HIV prevention, treatment, and sustainability of financing significantly advancing progress towards ending AIDS and achieving the Sustainable Development Goals at sub-national, national, and global levels.
However, this optimism is tempered by caution. International, regional, and country stakeholders, including the donors, should convene regularly to discuss the ways of mitigating risks of AI use in clinical and community settings, and the role of AI in planning and implementing sustainable national HIV responses.

EP0997

Exploring healthcare experiences of transgender people in the Jabula Uzibone Study, South Africa

R. Bothma[1], A. Pettifor[2], I. Maphosa[3], P. Ndlovu[1], J. Imrie[1], T. Poteat[4]
[1]Wits RHI, Key Populations Programme, Johannesburg, South Africa, [2]University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, [3]Stellenbosch University, Division of Epidemiology and Biostatistics, Department of Global Health, Faculty of Medicine and Health Sciences,, Stellenbosch, South Africa, [4]Duke University, Division of Healthcare in Adult Populations, Durham, United States

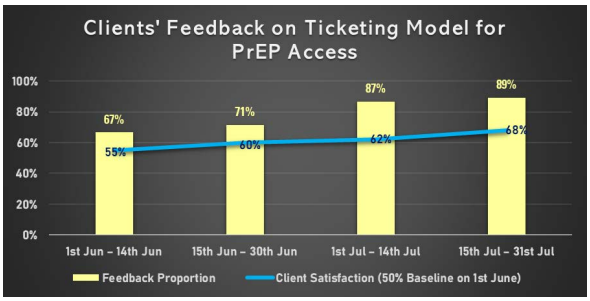
Background: The World Health Organisation (WHO) promotes transgender-differentiated service delivery (TG-DSD) model to overcome barriers to HIV service engagement among transgender people (TGP). For TGP an essential element of DSD includes gender affirming care which is non-stigmatising, and free from discrimination. The Jabula Uzibone (JU) Study, launched in November 2023, assesses the cost and effectiveness of TG-DSD on HIV outcomes.
In this paper we describe the characteristics of TGP in our study at baseline and explore whether there are differences in healthcare experiences among those seeking care at TG-DSD clinics versus standard service delivery (SSD) clinics.
Methods: This observational, mixed-method, prospective implementation study compares models of care at four SSD facilities and four TG-DSD sites using standardised observation checklists, in-depth, and key informant interviews. We ask participants about experiences of gender affirmation as well as experiences of stigma through a structured, interviewer-administered quantitative survey. We aimed to recruit 300 participants from TG-DSD sites and 300 from SSD sites (200/arm on antiretrovirals and 100/arm without HIV) for 12 months of follow-up.
Results: We enrolled 422 TGP with HIV (217 DSD and 205 SSD) and 248 TGP without HIV (128 DSD and 120 SSD); 15% (102/670) gender non-conforming, 15% (91/670) TG men, and 70% (477/670) TG women. The average age was 29 years. SSD participants at baseline were 46% more likely to experience stigma compared to their TG-DSD counterparts (aOR=1.46, 95%CI: 1.06,2.01).
SSD participants were more likely to encounter a healthcare provider who is unwilling to provide care for them (aOR=1.55, 95%CI: 1.09,2.21) and to report that health care workers are unable to provide the same quality care to TGP as they do other people (aOR=1.46, 95%CI: 1.00,1.91) compared to their TG-DSD counterparts.
Conclusions: TGP from DSD facilities were less likely to report experiences of facility-based enacted stigma at baseline, compared to the TGP from SSD facilities. Our study highlights the importance of provider training in tailored transgender health care to provide gender-affirming healthcare service.
Results from the JU study will provide further evidence of the effectiveness of TG-DSD models in sub-Saharan Africa, and the role of stigma and discrimination in HIV outcomes among TGP.

EP0998

Promoting positive experience with pre-exposure prophylaxis access through a ticketing model - a quality improvement initiative

C. Omom[1], J. Okoro[2], C. Owino[3], M. Otieno[3], D. Guya[4], M. Akoth[2], J. Onsomu[4]
[1]LVCT-Health, Research and Programmes, Kisumu, Kenya, [2]PATH/Ministry of Health, Programmes, Kisumu, Kenya, [3]LVCT-Health, Research and Programmes, Nairobi, Kenya, [4]PATH, Programmes, Kisumu, Kenya

Background: Pre-exposure prophylaxis (PrEP) stigma continues to be a major barrier to its implementation and use. One contributing factor to stigma at service delivery points is lack of privacy. To address this, a PrEP work improvement team (WIT) in a facility in western Kenya implemented a ticketing model to enhance privacy and reduce stigma due to name-calling, with the aim of improving client experiences.
Description: Between June 1 and July 31 2024, a facility WIT team comprising all cadres introduced a quality improvement approach that utilised improvised tickets from cut drug cartons numbered in pairs. The triage team received training on tickets issuance to replace name-calling during service delivery. A modified exit survey was issued to interested PrEP clients to assess their satisfaction with privacy and confidentiality during their visit. The survey included an open ended question to capture additional clients' opinions on the intervention. To monitor progress, feedback from exit forms was analysed bi-weekly using Excel, documenting feedback proportions and satisfaction levels across the period.
Lessons learned: Positive trends were observed in both the feedback proportions as well as clients' satisfaction (Figure1). PrEP clients praised the intervention for reducing name-calling and reported improvements in privacy and confidentiality, recommending its use in other service delivery points, such as laboratory. One client remarked, *"These tickets are a good idea."* However, some clients expressed concerns about the potential spread of transmissible diseases through shared tickets and suggested a digitalized system similar to banking services.



Conclusions/Next steps: Findings from the initial phase of the quality improvement project indicate that the ticketing model enhanced clients' experiences at the PrEP service delivery points. Scaling this practice within health systems could cut on stigma and improve access to PrEP for individuals who need it. Future efforts could explore digital solutions for broader implementation.

EP0999

The DREAMS interventions support school-going adolescent girls and young women (AGYW) in reducing pregnancy rates

S. Ndhlovu[1], E. Negumbo[2], D. Kakupa[3], R. Shipanga[4], J. Heita[5], L. Muzart[5], L. Bikinesi[1], M. Manyando[5], L. Shikongo[1]
[1]IntraHealth Namibia, Windhoek, Namibia, [2]IntraHealth International, Windhoek, Namibia, [3]Star for Life, Windhoek, Namibia, [4]Ministry of Education, Arts and Culture, Windhoek, Namibia, [5]U.S. Agency For International Development, Windhoek, Namibia

Background: According to the Namibia Ministry of Health and Social Services (2022) report, it was estimated that the teenage pregnancy rate among adolescent girls and young women (AGYW) aged 15- 19 was 23.9% in Kavango West region, which is the highest in the country. Adolescents who experience pregnancy may face challenges such as poor school performance and higher rates of dropping out.
Medically, pregnancy during adolescence can increase the risk of low birth weight, premature deliveries, congenital malformations, and challenges with fetal brain development. Adolescents who become pregnant may also encounter maternal complications, including elevated blood pressure, depression, and delivery-related injuries. Additionally, they may face an increased risk of sexually transmitted infections, including HIV.
Description: As part of the DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe) core package of interventions, the Reach Namibia project works closely with schools to engage AGYW. This includes education on pregnancy prevention, family planning, and providing services related to sexual and reproductive health (SRH). The importance of abstinence and delaying sexual activities is also emphasized in the DREAMS sessions.
The project implementation started in late 2023 and scaled up in 2024 in the Kavango West region. Selection of DREAMS schools was made in consultation with the Ministry of Education, Arts and Culture, at the regional level. The selection criteria prioritized schools with high pregnancy rates and school dropout rates.
Lessons learned: A total of 3,944 out of the estimated 5,925 (67%) AGYW population in Kavango West, aged 15–19, were reached with DREAMS interventions in 27 selected schools in the Kavango West region. In 2022, before the implementation of DREAMS activities, these schools recorded 326 pregnancies among adolescents compared to 162 pregnancies recorded in 2024.
This change represents a 49.7% reduction in pregnancy rates after the inception of DREAMS activities in the Kavango West region.
Conclusions/Next steps: The implementation of the DREAMS comprehensive package of services is showing promising results in reducing pregnancy rates among AGYW in the Kavango West region. Efforts must be made in collaboration with the Ministry of Education, Arts and Culture to scale up these interventions to reach more AGYW in schools.

EP1000

"We are like a family": traditional healers' and biomedical practitioners' perceptions of collaborative HIV care in rural Uganda

M. Hooda[1], S. Natukunda[2], G. Nuwagaba[2], W. Bugeza[2], C. Birungi[2], M. Tushabe[2], D. Nansera[2], W. Muyindike[2], J. Mwanga-Amumpaire[2], R. Sundararajan[1]

[1]Weill Cornell Medicine, New York, United States, [2]Mbarara University of Science and Technology, Mbarara, Uganda

Background: As Uganda approaches the UNAIDS's 95-95-95 targets, strategies are needed to close remaining care gaps. In rural areas, task-shifting has emerged as a promising strategy to enhance HIV testing and antiretroviral therapy (ART) adherence. Prior research highlights that involving traditional healers (TH) in HIV care can be effective, but programmatic success hinges on support from biomedical clinicians.

Our qualitative sub-study, embedded within an ongoing clinical trial, explores TH and clinician perspectives on collaboration to enhance HIV care for people living with HIV (PLWH) in their communities.

Methods: In July 2023, counselors from local HIV clinics trained 22 TH on principles of HIV transmission, prevention, ART adherence support, stigma reduction, and facilitating HIV self-testing. We conducted qualitative interviews with all participating TH and a purposive sample of clinicians from five HIV clinics in Mbarara and Rwampara Districts to explore their perceptions of training and collaboration. After 9 months, we conducted follow-up interviews to examine ongoing experiences. All interviews were conducted in the local language (Runyankole), audio-recorded, translated/transcribed into English, and thematically analyzed.

Results: Baseline and 9-month interviews were completed with 22 TH and 20 clinicians. Clinicians were optimistic about involving TH to improve rural HIV care, reduce HIV stigma, and facilitate serostatus disclosure, emphasizing that PLWH trust and frequently access TH. Clinicians also expressed concerns about TH maintaining confidentiality, potentially deterring PLWH from clinical care, and insufficient HIV-related knowledge. TH reported feeling ostracized by biomedical providers but voiced hope for collaborative partnerships that foster professional and social integration while preserving autonomy. After nine months, both groups reported significant progress in building relationships characterized by bidirectional trust, effective communication, and strengthened connections.

Conclusions: Our study demonstrates how task-shifting programming can bridge gaps between informal and biomedical care providers to potentially improve outcomes for PLWH.

Structured training and longitudinal engagement are essential to building trust and sustaining collaboration. While clinicians initially harbored biases against TH, continued collaboration fostered positive perceptions. TH experienced initial stigma but gained respect through demonstrating competency and trustworthiness.

Future efforts should focus on reducing stigma towards informal providers and integrating them into healthcare systems to address gaps in care for PLWH.

EP1001

Improving TB yield among household TB contacts through additional 6-months follow-up contact investigation: lessons from Malawi

S. Matewere[1]

[1]Partners in Hope, Medical, Lilongwe, Malawi

Background: World Health Organization recommends household TB contact investigation as one of the strategies for active TB case-finding. The Malawi National TB and Leprosy Elimination Program adopted the strategy and recommends that household contacts of pulmonary TB cases need to be screened within 2 weeks of TB treatment initiation. The national target for TB case yield from contact investigation is 1%, but routine data showed 0.1% performance in health facilities supported by Partners in Hope, a local medical organization. To improve yield from contact screening, we re-screened household contacts after 6-months from the initial screening to improve TB yield.

Description: With USAID funding, Partners in Hope collaborated with the Ministry of Health and Paradiso TB Patients Trust, to develop 6-month household contact rescreening in Lilongwe, Chikwawa, and Nsanje districts. Household contacts were line-listed from TB contact registers from the cohort that received initial screening between January 2023 and March 2024. Paradiso TB Patients Trust volunteers traced them for WHO standard 4-symptom TB screening. Sputum samples from presumptive TB cases were taken to the nearest facility for MTB Xpert or microscopy testing according to MOH guidelines.

Descriptive statistics were used to compare TB yield at initial versus at 6-month follow-up TB screening exercises, HIV-co-infection rate and mode of TB diagnosis.

Lessons learned: A total of 4,777 contacts were evaluated with only 0.1% (5/4,777) TB cases identified. In the 6-month re-screening exercise, 98% (4,688/4,777) contacts were screened and an additional 21 TB cases were identified. The yield of rescreening was 0.4% (21/4,764) and the combined TB yield from the initial and 6-month evaluation was 0.5% (26/4,777).

TB/HIV co-infection was 20% (5/26) and 88% (23/26) were MTB positive with no rifampicin resistance identified. The remaining three cases were diagnosed clinically. All TB clients were linked to treatment.

Conclusions/Next steps: Re-screening household contacts after 6 months by lay cadre volunteers demonstrated potential for improving TB case yield, which was 5 times higher than at the initial screening.

We recommend intensifying 6-month follow-up TB contact investigation in routine clinical practice. However, other interventions are needed to further improve TB yield from contacts to reach the national target.

EP1002

Factors influencing the attitudes and willingness of healthcare workers to offer pre-exposure prophylaxis in Africa: a systematic review and meta-analysis

V.O. Femi-Lawal[1], J. Ibekwe[1], O. Adebusuyi[2], O. Ogunlana[1], G. Oke[3]

[1]University of Ibadan, Department of Medicine and Surgery, Ibadan, Nigeria, [2]University of Ibadan, Faculty of Pharmacy, Ibadan, Nigeria, [3]Lancaster University, Lancaster, United Kingdom

Background: Pre-exposure prophylaxis (PrEP) is useful for preventing HIV acquisition among key populations. Healthcare workers' attitudes and willingness to provide PrEP can significantly influence its uptake among key populations.

We conducted a systematic review and meta-analysis to identify the factors influencing healthcare workers' (HCWs) attitudes and willingness to offer PrEP in Africa.

Methods: This study followed the PRISMA guidelines. A systematic search was conducted on PubMed, Google Scholar, Embase, and the Cochrane Library to identify relevant studies. Eligible studies reported on HCWs' knowledge, attitudes, or willingness to offer PrEP in Africa.

Study quality was assessed using Joanna Briggs Institute checklists Pooled proportions and 95% confidence intervals were calculated using the random effects model in R. Qualitative analyses were done to identify barriers and facilitators.

Results: From 293 unique citations, 34 studies across 12 countries comprising 2,758 participants were included. 60.4% of participants were female. Study designs included 7 quantitative studies, 1 mixed-methods study, and 26 qualitative studies. Nurses comprised 50.2% of HCWs, physicians 19.8%, counselors 8.13%, community health workers 8.04%, and pharmacists 3.92%.

PrEP awareness among HCWs was 86% (95% CI: 75% - 93%, I^2 = 88%) while only 18% of participants had good knowledge (95% CI: 4% - 55%, I^2 = 98.8%). Positive attitudes towards PrEP were expressed by 46% of HCWs (95% CI: 25% - 68%, I^2 = 97.74%), and willingness to offer PrEP was expressed by 58% (95% CI: 43% - 72%, I^2 = 95.28%), indicating relatively low levels of HCW willingness to offer PrEP.

Barriers to good knowledge, attitudes, and willingness to offer PrEP included moral objections, poor training, high workload, stigma, side effects, and concerns about adherence, efficacy, and risk compensation. Facilitators included adequate training, integration into existing services, perception of clients' HIV risk, younger HCW age, task shifting, community support, and the availability of adolescent-friendly health services.

Conclusions: This study demonstrates evidence of low knowledge, attitudes, and willingness to offer PrEP among HCWs in Africa, despite high levels of awareness.

There is a need for targeted interventions for improving HCWs' capacity and willingness to offer PrEP.

EP1003

Synergizing expertise: lessons learned from conducting the first HIV cure interventional trial in Africa with collaboration between academia, government, and industry

K. Dong[1], D. SenGupta[2], L. Gama[3], E. Vendrame[2], V. Pillay[4], D. Lim[2], Z. Alghanim[2], M. Callaghan[2], C. Molokwu[2], M.L. Mehrotra[2], T. Chakrabarti[2], O. Fu[2], T. Ndung'u[5]

[1]Ragon Institute of MGH, MIT and Harvard, Cambridge, United States, [2]Gilead Sciences, Inc., Foster City, United States, [3]Vaccine Research Center, NIAID, NIH, Bethesda, United States, [4]Females Rising through Education, Support and Health, Durban, South Africa, [5]The Doris Duke Medical Research Institute, University of KwaZulu-Natal, HIV Pathogenesis Programme, Durban, South Africa

Background: We conducted the first interventional HIV cure trial in Africa (NCT05281510) from June 2022 through January 2025. The study included an analytical treatment interruption (ATI) and enrolled early-treated young women living with clade C HIV-1 in South Africa, a population that bears a disproportionate burden of the global epidemic but remains underrepresented in clinical trials.

Description: This single-arm, open-label, clinical trial enrolled 20 women from the Females Rising through Education, Support, and Health (FRESH) cohort in Durban, South Africa, detected and treated during acute HIV.

Participants received 2 broadly neutralizing antibodies (bNAbs; VRC07-523LS and CAP256V2LS) and a Toll-like receptor 7 agonist, vesatolimod (VES), and underwent ATI for up to 55 weeks or until meeting antiretroviral therapy (ART) restart criteria.

There was early community engagement, extensive safety monitoring, including prolonged observation after VES and bNAb dosing, biweekly or weekly visits, frequent blood and tissue sampling, and longitudinal assessment of participant experiences. Participants who remained virally suppressed at the end of study and chose to remain off ART continued close monitoring through FRESH.

Lessons learned: This study provides insights into the implementation of complex trials in resource-limited settings. Having an established cohort and a trusting relationship with the site staff facilitated recruitment and likely improved participant retention and adherence to an intensive study protocol.

Gilead Sciences sponsored the trial and worked closely with key collaborators: the NIH Vaccine Research Center contributed extensive knowledge on bNAb development and supplied bNAbs, and the academic partners at the University of KwaZulu-Natal and the Ragon Institute provided scientific input and deep contextual knowledge of the local setting.

Finally, the study weathered several disruptive external events, including natural disasters, political unrest, and the COVID-19 pandemic, which required agility, resilience and extensive community engagement.

Conclusions/Next steps: It is critical to consider context and have a concrete plan for monitoring participants who remain off ART after study conclusion. This trial was a culmination of a productive partnership between aca-

demia, government, and industry, and demonstrated the feasibility of conducting complex HIV cure trials in Africa, where the most stand to benefit from these interventions.

EP1004

Imbedding comprehensive geriatrics assessment within a large HIV Clinic in western Kenya

J. Kiplagat[1], R. Nehema[2], D. Gaitho[2], S. Ali[3], E. Too[2], K. Wagle[4], S. Kimaiyo[3], K. Wools-Kaloustian[5]
[1]Moi University, Epidemiology and Medical Statistics, Eldoret, Kenya, [2]Academic Model Providing Access to Healthcare, Eldoret, Kenya, [3]Moi University, Internal Medicine, Eldoret, Kenya, [4]Indiana University, Indianapolis, United States, [5]Indiana University, Internal Medicine, Indianapolis, United States

Background: Advances in antiretroviral therapy have extended the life expectancy of people living with HIV, resulting in a growing population of older adults living with HIV (OALWH) who face unique health challenges. Integrating Comprehensive Geriatric Assessment (CGA)—a systematic approach to identifying geriatric issues, preventing complications, and developing personalized care plans—has become increasingly important in HIV clinics. At the Academic Model Providing Access to Healthcare (AMPATH), one of the largest HIV programs in sub-Saharan Africa, we evaluated the utilization of the World Health Organization's Integrated Care for Older People (ICOPE) tool to prioritize and enhance care for OALWH.
Methods: We adapted the ICOPE tool to assess key domains of healthy aging, including cognition, mobility, nutrition, vision, hearing, and depressive symptoms, while incorporating questions on polypharmacy and comorbidities. HIV clinicians at the AMPATH clinic at Moi Teaching and Referral Hospital were trained on the adapted tool and data entry into REDCap. In November 2024, the trained clinicians utilized the adapted tool to assess individuals aged 50 years and above living with HIV during their routine clinic visits, entering the data directly into REDCap. Descriptive statistics were generated, including the frequencies of assessed conditions, to summarize the health profile of the participants.
Results: A total of 89 OALWH were assessed, the median age was 63.8 years (IQR: 61–67), and 65.8% were female. Cognitive impairment was identified in 15%, while two-thirds completed chair rises successfully. Falls were reported by 15%, and 11.4% experienced unintentional weight loss (1–3 kg) in the previous month, with 85% of these reporting appetite loss. Visual impairment affected 73%, while 9% and 8% experienced hearing loss in one or both ears, respectively. Depressive symptoms were present in 21.3%, 35.9% were on polypharmacy (more than five pills daily), and 68.5% had multimorbidity, including 25% with hypertension.
Conclusions: These findings underscore the diverse health challenges of OALWH and the need for integrated, holistic care. Tools like ICOPE can systematically identify and address these issues, enhancing outcomes and quality of life through tailored, multidisciplinary, patient-centered care strategies.

EP1005

Baseline HIV stigma among barbers and patrons in Tennessee and implications for barbershop-based stigma reduction interventions

J.M. Perkins[1], R. Hu[2], A. Riccio[1,1], D. Tien[2], C. Eliazer[2], L.J. Pierce[2], J. Kerr[3], S. Hull[4], D. Conserve[5], S. Nelson[6], N. King[7], S. Gunn[8], K. Oliver[8], S. Hurt[8], A.A. Ahonkhai[2], Cutting Out Stigma Study
[1]Vanderbilt University, Nashville, United States, [2]MGH, Boston, United States, [3]NA, Louisville, United States, [4]Rutgers University, Rutgers, United States, [5]George Washington University, Washington DC, United States, [6]Distinguished Gentlemen, Nashville, United States, [7]Luxury Mobile Barbering, Nashville, United States, [8]StreetWorks LLC, Nashville, United States

Background: HIV-related stigma is a barrier to addressing HIV care and prevention needs, and disproportionately impacts marginalized communities in the Southern United States. Cutting Out Stigma (COS) is a community-partnered, barbershop-based intervention designed to train Black barbers in Tennessee as Men's Health Ambassadors who promote sexual health, address HIV misinformation, and reduce HIV stigma.
This study aimed to assess baseline HIV stigma among participating barbers and their patrons, exploring differences between cities and populations.
Methods: social media and HIV care organization networks to participate in a one-day workshop to train them as Men's Health Ambassadors for the COS intervention. At workshop completion, we assessed HIV-related stigma using a validated scale comprising three subscales: negative attitudes, perceived discrimination, and equitable treatment in society. A convenience sample of patrons aged ≥18 years were subsequently recruited from shops of trained barbers using the same scale. Scores ranged from 1 to 4, with higher scores indicating greater stigma. Total and subscale stigma scores were compared within and between groups using unpaired t-tests.
Results: Sixty-seven barbers (38 Nashville, 29 Memphis) representing 34 shops (17 Nashville, 17 Memphis), and 88 patrons (80 Nashville, 8 Memphis) across 6 shops participated. Barbers' average age was 38.6 years, and patrons' average age was 36.2 years; 67% of barbers and 26% of patrons reported having post-high school education. Barbers exhibited higher total stigma scores (1.94 vs. 1.68, p=0.001) and negative attitude scores (1.53 vs. 1.26, p=0.001) compared to patrons. Among the subscales, average perceived discrimination scores were highest overall and were also greater among barbers than patrons (2.59 vs. 2.06, p=0.001). No differences were found in equity scores between barbers and patrons (1.69 vs. 1.86, p=0.19). Stigma scores among barbers and patrons did not vary by age, education, or city (p>0.5).
Conclusions: Barbers exhibited higher baseline stigma levels than patrons. While this finding might reflect heightened sensitivity among barbers to HIV stigma post training, it also highlights the importance of addressing implicit and explicit biases among community leaders who deliver HIV stigma reduction interventions.

EP1006

Sustaining HIV prevention amid resource constraints: strengthening community systems through a community-led monitoring approach in Matabeleland South

E. Huchu[1], F. Mudzengerere[1], E. Tachiwenyika[1], H. Mafaune[1], S. Moyo[2], F. Mudokwani[2], K. Yogo[2], D. Dhakwa[2], B. Madzima[3], R. Yekeye[3], T. Tafuma[2], T. Bhatasara[4]
[1]Zimbabwe Health Interventions, Strategic Information and Evaluation, Harare, Zimbabwe, [2]Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, [3]National AIDS Council, Programs, Harare, Zimbabwe, [4]USAID, Program Management, Harare, Zimbabwe

Background: In resource-constrained settings like Matabeleland South, a Zimbabwe region with high HIV prevalence, sustaining prevention efforts requires innovative strategies that leverage community systems for program delivery and monitoring. Community-led monitoring (CLM) emerged as a transformative approach to address barriers to service access and enhance accountability. Implemented from 2023 to date, CLM facilitated feedback loops between communities and service providers, strengthened program ownership, and identified gaps in service provision.
This study evaluated the impact of CLM on the availability and quality of DREAMS services, attitudes toward harmful practices such as child marriages, school retention and reintegration rates for adolescent girls and young women (AGYW), and accountability in HIV prevention efforts.
Description: A cross-sectional approach assessed the impact of CLM activities across six districts of Matabeleland South. Data collection included focus group discussions with Community-Led Monitoring Taskforces (CLMTs), interviews with political, religious, and traditional leaders, and Zimbabwe Health Interventions program data reviews from 2023 to 2024. Key indicators included DREAMS service quality, school communities' attitudes toward harmful practices, school retention rates, and reintegration of school dropouts using village registers.
Lessons learned: CLM proved transformative in HIV prevention:

- Enhanced Services: CLM identified service gaps, leading to targeted interventions. 83% of CLMTs reported decreased child marriages.
- Educational Gains: Village registers showed a 73% reduction in school dropouts (6 vs. 23 the previous year).
- Reintegration Success: 98% (244/248) of dropouts were reintegrated into school.
- Community Empowerment: CLM fostered program ownership and improved service delivery accountability, cited by 75% of participants.

Conclusions/Next steps: CLM is a scalable, sustainable solution for HIV prevention in resource-limited settings. It places communities at the center of program monitoring and decision-making, addressing systemic challenges while enhancing accountability and relevance. Expanding CLM, building CLMT capacity, and integrating its lessons into national strategies are critical next steps to sustain gains in epidemic control.

EP1007

Expanding access to HIV and sexual reproductive health products and services in Zimbabwe: key findings from a private pharmacy market assessment

F. Tembo[1], K. Chatora[2], B. Maponga[1], T. Moga[3], J. Mavudze[3], B. Mutede[3], N. Taruberekera[4], K. Hatzold[5]
[1]Population Services International, HIV/TB/Hepatitis, Harare, Zimbabwe, [2]Population Solutions for Health, Communications and Marketing, Harare, Zimbabwe, [3]Population Solutions for Health, HIV, Harare, Zimbabwe, [4]Population Solutions for Health, Harare, Zimbabwe, [5]Population Services International, HIV/TB/Hepatitis, Cape Town, South Africa

Background: Despite progress toward HIV epidemic control in Zimbabwe, gaps in access to HIV and sexual reproductive health (SRH) products persist, particularly for key populations. Pharmacies provide a stigma-free, discreet, and cost-effective alternative to public and private health facilities, yet restrictive policies have limited their potential to deliver HIV and SRH services.
To address this, Population Services International (PSI), Population Solutions for Health (PSH), and the Ministry of Health conducted a market assessment of Zimbabwe's private pharmaceutical sector to identify gaps and opportunities for enhancing access to essential HIV/SRH products and services.
Methods: Between April and June 2024, 23 key informant interviews (KIIs) were conducted with stakeholders, including manufacturers, distributors, pharmacy networks, regulators, government agencies, and funders.
Secondary research included a desk review of literature, sales, and prior market assessments (2021–2024). Data were synthesized through thematic content analysis, triangulation of KII insights, and quantitative analysis of product sales, pricing, and margin economics.
Results: Private pharmacies in Zimbabwe serve diverse clientele, including youth ages 15 to–24, key populations, and adult general population. Popular products include condoms, HIV self-tests, emergency contraception, and oral contraceptives. Although HIV Pre-and Post Exposure Prophylaxis are available, demand remains low due to free availability in public facilities, high private-sector prices, and limited consumer awareness.
Key barriers include restrictive policies limiting pharmacists' scope of practice, unregulated markets for products like HIV self-test kits, low procurement volumes leading to stock-outs, and limited consumer willingness or ability to pay.
Conclusions: Private pharmacies have significant potential to expand access to HIV and SRH services in Zimbabwe, particularly for underserved populations and those at highest HIV risk. Key strategies include expanding pharmacists' roles, fostering public-private partnerships for training, and improving cross-sector data exchange. Despite price sensitivity, the trust in community pharmacies positions them as critical access points for HIV and SRH services. Addressing these barriers can strengthen pharmacies' contributions to Zimbabwe's HIV response.

EP1008

Improving Pre-Exposure Prophylaxis uptake among sexually transmitted infections clients through integrated service delivery: lessons from PrEP up! Quality improvement collaborative in Blantyre, Malawi

S. Likumbo[1], E. Moses[2], M. Enock[2], Y. Kamgwira[3], D. Kasale[3], J. Murungu[4], B. Agins[5], R. Birchard[5], S. Allinder[6], D. Hoege[7], C. Holmes[6], G. Kawalazira[1]
[1]Blantyre District Health Office, Blantyre, Malawi, [2]Independent Consultant, Lilongwe, Malawi, [3]Malawi National AIDS Commission, Blantyre, Malawi, [4]HealthQual, University of California at San Francisco, Harare, Zimbabwe, [5]HealthQual, University of California at San Francisco, New York, United States, [6]Center for Innovation in Global Health, Georgetown University, Washington, DC, United States, [7]Center for Innovation in Global Health, Georgetown University, New York, United States

Background: Malawi's public facility rollout of oral PrEP for HIV prevention began in 2021. Since the introduction of oral PrEP in Blantyre—Malawi's district with the highest HIV prevalence—a significant number of eligible clients were those who came with an STI, but they were missed since PrEP service delivery was done only at ART clinics. Malawi is among the top 10 countries with highest rates of STIs including HIV, but after oral PrEP introduction, only one public facility in Blantyre integrated PrEP with sexually transmitted infections (STI) services.
Therefore, the Blantyre District Health Office, with support from the Blantyre Prevention Strategy (BPS), launched an STI-focused Quality Improvement Collaborative (QIC) affinity group in 2023, which aimed to increase PrEP uptake among STI clients across 18 facilities (4 hospitals and 14 health centers). The affinity group approach was a novel strategy for improving access to HIV prevention services in Malawi.
Description: The district-based STI-PrEP affinity group comprised of STI and PrEP providers was launched after a one-day orientation on the affinity group approach. Standardized indicators for STI and PrEP services were introduced. Facilities developed tailored client flow processes and implemented Quality Improvement (QI) changes.
The group held monthly virtual meetings where data was presented on total STI diagnosis, percentage of STI clients ascertained for HIV and their results, and percentage of eligible clients who were initiated on PrEP. Progress and data were reviewed quarterly during QIC learning sessions.
Lessons learned: The integration of PrEP into STI services via the QIC affinity group led to significant improvements. Public facilities offering integrated PrEP-STI services increased from 1 (6%) to 12 (67%) out of 18. PrEP uptake increased by 75% in facilities with integrated services, with PrEP initiation among eligible STI clients increasing substantially to 82% from 16%.
Key changes contributing to these outcomes included demand creation for PrEP services, redesigning client flows, peer-to-peer service navigation, and a "same-room, same-provider" service model.
Conclusions/Next steps: Integrating PrEP into existing HIV prevention services is an effective strategy for improving PrEP uptake. The QIC affinity group approach serves as a valuable catalyst for achieving effective service integration and scaling HIV prevention efforts.

EP1009

What's YAB got to do with it? Best practices from an urban youth advisory board promoting sexual health and PrEP in the U.S.

K. Abdullah[1], N. Rakhmanina[1,2,3], M. Davies-Cole[1,4], K. Walker[1,5], M. Mwembo[1,6], J. Unternaher[1], R. Aturaliya[1], O. Awofeso[1]
[1]Children's National Hospital, HIV Prevention and Treatment Services, Washington, United States, [2]George Washington University, Department of Pediatrics, The School of Medicine and Health Sciences, Washington, United States, [3]Elizabeth Glaser Pediatric AIDS Foundation, Washington, United States, [4]George Washington University, Milken School of Public Health, Student, Washington, United States, [5]McKinley Technology High School, Student, Washington, United States, [6]Montgomery College, Student, Germantown, United States

Background: Youth education and empowerment combats the stigma and misinformation surrounding HIV. Youth Advisory Boards (YAB) play a critical role in educating young people about HIV and sexual and reproductive health while dismantling biases.
Here we share lessons learned from implementing a status-neutral YAB at the HIV program at Children's National Hospital (CNH) in the United States.
Description: Launched in July 2023, the HIV status-neutral YAB recruited 25 youth, ages 13-24, with and without HIV, through school workshops, community clinics, referrals, and outreach events. From August 2023 to May 2024, the CNH outreach team convened monthly YAB meetings focusing on HIV education. In August 2024, the YAB transitioned to a peer-based leadership infrastructure to optimize youth involvement, address their unique needs, and engage them in HIV prevention and treatment education through guest speakers from diverse programs and community partners.
To engage their peers in HIV and PrEP discussions outside of the YAB, members launched several projects, including the *"PrEP The Youth"* podcast and Instagram account, and organized multiple community events (e.g., fashion shows, LGBTQ+ Pride celebrations, and hot chocolate socials). The podcast, launched in September 2024, is co-hosted by two YAB members, a college and a high school student, and covers topics on sexual health, PrEP, and research, featuring guests from health departments, research networks, and youth. The podcast has reached over 2000 viewers, boosting social media engagement. In 2025, a YAB-inspired "*PrEP The Youth*" website will launch as an online sexual health hub for youth.
Lessons learned: A successful YAB thrives on shared leadership and responsibility. By transitioning leadership to youth, members can tailor initiatives to their communities' needs. Youth are encouraged to engage openly

in discussions, creating a respectful environment where misinformation is corrected. Additionally, social media engagement and the podcast allowed YAB to reach larger audiences.

Conclusions/Next steps: YABs play a vital role in ending the HIV epidemic by breaking sexual health taboos and engaging youth in meaningful ways. By dividing responsibility, YAB members stay invested in advocating for HIV and PrEP education both within the group and their communities. Moving forward, members will continue expanding their leadership and fostering peer-to-peer relationships.

EP1010

Expanding the network: baseline assessment on provision of HIV and SRH prevention services in private sector facilities in Bulawayo, Zimbabwe

S. Manjengwa[1], K.C. Takarinda[1], M. Hove[1], T.T. Mhlanga[1], S. Page-Mtongwiza[1], K. Webb[1], P.T. Chimberengwa[1,2]
[1]Organization for Public Health Interventions & Development (OPHID), Harare, Zimbabwe, [2]National University of Science and Technology, Bulawayo, Zimbabwe

Background: Zimbabwe faces a generalized HIV epidemic, with adolescent girls and young women (AGYW), at-risk young men disproportionately affected. Despite access to HIV prevention and sexual and reproductive health (SRH) services in the public sector, barriers to access exist. To improve access, the Triple-P project was commenced to explore how to expand adolescent-friendly HIV/SRH services through private-sector pharmacies and clinics in Bulawayo, Zimbabwe.

A baseline assessment was conducted to evaluate the current capacity of selected private-sector health facilities and assess available HIV prevention services prior to project inception.

Methods: A mixed-methods approach, combining semi-structured questionnaires and facility observations was conducted across 21 private health institutions between March-May 2024. Targeted private health facilities included retail pharmacies (14/21), hospitals (4/21) and clinics (2/21) and private doctor's practices (2/21). Data was collected using an ODK customized tool and was analyzed using Stata Version 17.

Results: While the majority, especially pharmacies, offered oral contraceptives (81%), emergency contraceptives (76%), HIV self-test kits (76%), and pregnancy test kits (67%), access to HIV post-exposure prophylaxis (57%) and pre-exposure prophylaxis (22%) was limited. Regarding HIV/SRH services, family planning counselling (90%) and pregnancy testing (86%) were widely available, including at pharmacies.

However, availability of sexually transmitted disease diagnosis and treatment (61%) and HIV testing and counselling (52%) was low, especially at pharmacies. Despite this, private pharmacies and clinics were conveniently located, had lower waiting times, and offer integrated services. Referral systems though present, were informal and lacked standardization, undermining service linkages and follow-up, highlighting gaps in staff training and service integration. Other challenges included commodity stock-outs, high pricing, inadequate infrastructure for confidential consultations, and limited client awareness of available prevention options.

Conclusions: Expanding the network of HIV prevention services through engagement of private sector partners would complement existing efforts within public sector and may reach clients who are missed or do not access public health services for a variety of reasons.

The Triple P program will design and test a model of public private partnership that will expand HIV prevention services for AGYW and at-risk young men through addressing barriers such as training gaps, product availability, affordability, infrastructure constraints and regulatory barriers.

EP1011

Does person-centered care translate to better HIV treatment outcomes? Evaluating the effectiveness of a person-centered care assessment tool in HIV treatment settings in Zambia

L. Kawanga[1], A. Ndhlovu[1], J. Musangulule[1], D. Mwamba[2], J. Posner[3], M. Musonda[2]
[1]JSI, USAID DISCOVER Health Project, Lusaka, Zambia, [2]USAID, Health, Lusaka, Zambia, [3]JSI, HIV and Infectious Disease Center, Washington, United States

Background: Person-centered care (PCC) demonstrates the potential to overcome inequities across the HIV care continuum, while increasing efficiencies and improving treatment outcomes. Despite PCC being considered a best practice, no consensus exists on how to systematically measure and assess it against health outcomes.

To address this gap, JSI developed a PCC assessment tool (PCC-AT) to strengthen health facilities' ability to operationalize PCC in HIV treatment settings.

Methods: JSI conducted a mixed-methods study in September 2023 at 29 randomly selected facilities in Zambia's Copperbelt and Central provinces to evaluate PCC-AT effectiveness in measuring PCC delivery, and assess relationships between PCC delivery and key HIV treatment outcomes. Advisors from the JSI-led USAID DISCOVER-Health project facilitated discussions with antiretroviral treatment (ART) provision teams to develop consensus scores from 1 (standard never met) to 4 (standard always met) across 3 PCC-AT domains (staffing, service provision, direct client support), and action plans to identify PCC-strengthening activities.

Quantitative analysis included descriptive statistics, cross-tabulations and regression techniques to assess associations between PCC-AT scores and aggregate HIV treatment outcomes (treatment continuity, VL coverage, viral suppression). Action plan data was analyzed using descriptive coding.

Results: Median PCC-AT scores were highest in the staffing domain at 3.0 (2.25-3.75), with service provision at 2.5 (1.5-2.75), and direct client support at 2.5 (1.5-3.0). HIV treatment outcomes were generally high: median treat-

ment continuity was 100% (97%-100%), VL coverage 85% (70%-98%), and viral suppression 97% (91%-100%). PCC-AT scores varied by outcome measure, however, no statistically significant associations were found.
Facilities proposed PCC-strengthening actions most frequently within the client feedback mechanisms subdomain, followed by staff availability, composition, competency, and digital health worker support tools.
Conclusions: This study contributes to the evidence base on how to measure and improve PCC delivery in HIV treatment settings. Facility PCC-AT scores were not significantly associated with aggregate HIV treatment outcomes, likely due to the high performance in outcomes among facilities in the sample.
However, even in high-performing facilities, the PCC-AT helped staff identify ways to improve PCC, demonstrating a promising approach for using data to improve HIV programming at scale.

EP1012

Sustaining adolescent viral suppression through collaborative approaches during adolescent clinic days in Zimbabwe

G. Katsamba[1], J. Magura[1], C. Bure[1], Y. Mbaura[1], V. Guvava[1], H. Tanyanyiwa[1], K. Masunda[1], A. Shamu[2]
[1]JF Kapnek Zimbabwe, Health, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Health, Masvingo, Zimbabwe

Background: Differentiated service delivery models (DSD) in the provision of antiretroviral therapy (ART) services remain key in addressing the needs of different target populations. Viral load coverage (VLC) and viral suppression are critical indicators in monitoring treatment, access and response for people on ART. UNAIDS in 2023 described that globally only 59% of people of ART were achieving viral suppression. Among children and adolescents in 2021 the viral suppression was around 41%. The low viral suppression is due to poor access to monitoring services, suboptimal adherence to treatment and stigma. This calls for holistic and collaborative approaches to improve access to services and offer relevant support services for adolescents to meet the 95-95-95 global targets.
Description: JF Kapnek Zimbabwe is implementing the Target Accelerate Sustain Quality Care (TASQC) program from 2020 supporting the Ministry of Health in Zimbabwe. The project has been supporting Adolescent Clinic Days since 2020. The package of care during the adolescent clinic days includes clinical care services, peer counselling, games, enhanced adherence sessions for those with high viral loads and mental health counselling.
Stakeholders from the clinical, laboratory, social services, peer counselors, community health workers and mental health nurses are involved. Viral load monitoring data from 18 clinics in Masvingo district for the age group 10-19 was analyzed to ascertain the VLC and viral suppression trends from October 2020 to June 2024.
Lessons learned: The average VLC was 81% whilst the average viral suppression rate was 90%. For health facilities, only 9 out of the 18 facilities had VLC above 90% in 2020 and in 2024 13 facilities out of the 18 had VLC above 90%. In 2020, 3 out of the 18 facilities had viral suppression rates at 95% and above whilst in 2024, 14 out of the 18 facilities had viral suppression rates at 95% and above.
Conclusions/Next steps: Adolescent clinics are critical as a DSD model to ensure that progress made by facilities in increasing the viral load coverages and sustaining high viral suppression rates is maintained. The use of multidisciplinary teams during these clinics which serve different needs of the adolescents is important.

EP1013

Standardized ART outcomes of residents from border countries compared to Malawian residents registered in the Malawi ART program

J.D. Njala[1], K. Balakasi[1], H. Chimbaka[1], Y. Mhone[1], E. Mittochi[1], G. Mateyu[1], A. Moses[2], J.J. van Osterhout[3], K. Nyirenda[1], S. Phiri[1]
[1]Partners In Hope, Programs - Clinical, Lilongwe, Malawi, [2]Partners In Hope, Medical Centre, Lilongwe, Malawi, [3]University of California Los Angeles, David Geffen School of Medicine, Los Angeles, United States

Background: Regular cross-border mobility is a risk factor for unfavorable antiretroviral therapy (ART) outcomes, in particular for attrition from care. We compared standardized ART outcomes between residents from Malawi with residents from border countries, registered in the Malawi HIV program.
Methods: We conducted a retrospective-analysis at 25 health facilities (HFs) whose catchment areas border Mozambique, Tanzania and Zambia in 4 districts supported by Partners in Hope, a Malawian non-governmental, PEPFAR implementing partner. We extracted routinely collected, aggregated data from ART registers and electronic monitoring systems of individuals (all ages), enrolled on ART between the opening of each ART clinic and December 2024.
We used descriptive statistics to analyze data for the following routine ART outcomes: Alive on ART; Died; Transferred Out (TO), i.e. formally administrated to another ART clinic; Stopped ART and Defaulted, defined as missed last appointment and known to have run out of ART for at least 60 days. We calculated Total Adverse Outcomes by adding up Died, Stopped ART and Defaulted. We used the total ever registered (TER) on ART at the HF as denominator for the prevalence of TO. For prevalence of Alive on ART, Died and Defaulted, we used TER minus TO.
Results: Among 115,396 individuals who ever registered on ART, 7,310 (6.3%) were residents from border countries. TO prevalence was not significantly higher among residents from Malawi than residents from border countries (22.0% vs. 19.4%; p=0.759). Prevalence of Alive on ART (57.5% vs. 52.4%; p=0.193) and Stopped ART (0.9% vs. 0.8%; p=0.914) were similar in both groups, but more had died (10.3% vs. 3.9%; p<0.001), among Malawian residents. Prevalence of Defaulted was significantly higher among residents from border countries (31.4% vs. 42.8%; p=0.003). Prevalence of Total Adverse Outcomes was higher among border country residents (vs 42.5% vs. 47.6%; p=0.189), though the difference was not statistically significant.

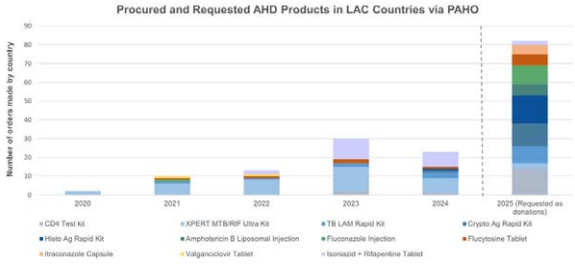
Conclusions: The higher prevalence of Died among Malawian residents may be impacted by detection bias. Although the much higher probability of defaulting from ART among residents from Mozambique may be influenced by more silent, informal transfers to other ART clinics, interventions to improve their continuity of care need to be considered.

EP1014

Opportunities to strengthen procurement of advanced HIV disease commodities in Latin America and the Caribbean

M. Salvat[1], K. Hallar[1], M. Alonso[1], N. Giron[1], C. Lim[1], O. Sued[1]
[1]Pan American Health Organization, Washington DC, United States

Background: Latin America and the Caribbean (LAC) report approximately 33,000 HIV-related deaths annually, with opportunistic infections (OIs) like tuberculosis (TB), histoplasmosis, and cryptococcal meningitis contributing significantly. Despite the proven efficacy of the WHO-recommended Advanced HIV Disease (AHD) package, which includes priority rapid diagnostic tests and treatments for OIs, its implementation in LAC remains limited.
To address this, the Pan American Health Organization (PAHO), with support from Unitaid, is collaborating with countries to expand access to AHD commodities in the region.
Description: The PAHO Strategic Fund (SF), a pooled procurement mechanism, facilitates access to essential health commodities across LAC. We analyzed SF procurement data for AHD-related commodities from 2020 to 2024. Additionally, during Q4 2024, we surveyed National HIV Programs in the region to evaluate their interest in receiving in-kind donations of AHD products through PAHO in 2025.
Lessons learned: Between 2020 and 2024, there was a gradual increase in the procurement of specific AHD products across LAC, predominantly focused on TB, with products such as XPERT MTB/RIF Ultra Kits and 3HP regimen accounting for most orders. However, the procurement of commodities for the diagnosis and treatment of OIs remained low during this period. Survey responses from 17 National HIV programs showed interest in receiving AHD products as in-kind donations for 2025, with 15 countries expressing interest in Histo Ag rapid tests, and 12 in Crypto Ag rapid tests.



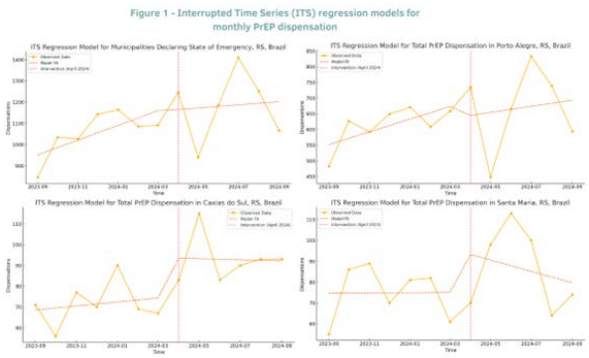
Conclusions/Next steps: Survey responses reflect that countries are open to incorporating AHD commodities when provided at no cost, recognizing their importance in addressing AHD-related OIs and reducing mortality. This interest when products are offered for free suggests that affordability plays a significant role in affecting their inclusion in national procurement plans. This underscores the potential of PAHO's SF to address this barrier by consolidating demand, achieving more competitive pricing, and supporting AHD procurement plans across the region.

EP1015

Resilient HIV prevention during climate crisis: insights from PrEP dispensation in Brazil's 2024 floods

D. Castanheira[1], R. Coelho[2], E. Jalil[1], T. Nery[1], T. Torres[1], M. Secco Torres Silva[1], B. Hoagland[1], M. Benedetti[1], B. Grinsztejn[1], V. Veloso[1], C. Coutinho[1]
[1]Instituto Nacional de Infectologia Evandro Chagas (INI/Fiocruz), Rio de Janeiro, Brazil, [2]Ministry of Health of Brazil, Brasília, Brazil

Background: Climate change heavily impacted Brazil in 2024, particularly Rio Grande do Sul (RS) state, where an historical flood occurring between late April-May led to a state of public emergency. Over 60% of the state was affected, with 629,000 people displaced. HIV pre exposure prophylaxis (PrEP) is available in Brazil through the National Public Health System (SUS) since 2017. This study assessed the flood's impact on HIV PrEP dispensation.
Methods: We analyzed PrEP dispensation data from the national HIV medication control system (SICLOM) for the 78 municipalities in RS under public calamity status September 2023-September 2024. SICLOM is a robust Brazilian electronic system for managing and monitoring the distribution of all antiretroviral medications dispensed in the country, including PrEP.
An **Interrupted Time Series (ITS)** analysis evaluated trends and changes in PrEP dispensation level before, during, and after the flood. Data were stratified by municipality, age, race, and educational level.
Results: Out of the 78 affected municipalities, only 19 (24.4%) had PrEP services with at least one PrEP dispensation and were included in this analysis. In May 2024, PrEP dispensations declined, coinciding with the flood peak, followed by a compensatory increase in the subsequent months, though these changes were not statistically significant (Figure). In Porto Alegre, RS capital, which was severely affected, the decline in May was the most pronounced (Figure).



Younger people, Black individuals, and those with lower educational levels experienced a greater decline in dispensations, but these differences were not statistically significant.

Conclusions: We did not observe a significant impact of the 2024 flood on PrEP dispensing rates. PrEP services through the Brazilian public health system remained accessible, demonstrating system resilience, however, overall limited PrEP availability highlights the need to expand access in underserved regions. Future research should explore the long-term effects of climate emergencies on HIV prevention to protect vulnerable populations.

HIV and development synergies

EP1016

Can male engagement activities increase participation in gender-based violence prevention programs? A case of SASA! Together in Tsholotsho district, Zimbabwe (2024)

L.R. Chanakira[1], R. Eghtessadi[1], C. Masuka[1], E. Hutire[1], L. Sibanda[2], P. Ntini[2], A. Korn[3], T. Mharadze[4], M.L. Hove[5], G. Ncube[6]

[1]SAfAIDS, Harare, Zimbabwe, [2]Zimbabwe Technical Assistance Training and Education Center for Health (Zim-TTECH), Bulawayo, Zimbabwe, [3]International Training and Education Centre for Health (I-TECH), Seattle, United States, [4]Centers for Disease Control and Prevention (CDC) Zimbabwe, Division of Global HIV and TB (DGHT), Harare, Zimbabwe, [5]Zimbabwe Technical Assistance Training and Education Center for Health (Zim-TTECH), Harare, Zimbabwe, [6]Ministry of Health and Child Care, Harare, Zimbabwe

Background: Harmful gender norms (e.g., men's power over women) have been recognized as a key contributory factor to gender-based violence (GBV). Engaging men and boys can potentially strengthen the effectiveness of GBV prevention. The DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored and Safe) program aims to reduce HIV and GBV incidence among adolescent girls and young women, integrating community gender norms transformation (GNT) approaches that include the Start, Awareness, Support, Action (SASA!) Together model, which explores power dynamics between men and women through community dialogues that focus on addressing GBV and identifying men's power over women as the root cause of violence against women.

Description: Previous feedback on SASA! Together community dialogues indicated that men perceived SASA! Together as 'feminine with focus on women's issues.' SAfAIDS, a DREAMS implementing partner, responded by piloting 'Men-Only' SASA! Together dialogues in Tsholotsho through capacitating male community members, including political, religious and traditional (PRT) leaders to support male mobilization. SAfAIDS adapted SASA! Together integrating GNT approaches to counter harmful/toxic masculinities (e.g., male chauvinism); balance power dynamics, and equip men as proponents in ending GBV. Three groups with 25 male participants each (>18 years) as guided by SASA! Together model, were mobilized by SASA! Champions to attend eight sessions, over six months. Male mobilization increased by 5% through engaging trained male SASA! Champions, who conducted dialogues at places where men frequently congregate e.g., shopping centers on Wednesdays, a holy day of rest ("Chisi/Izilo") in the district.

Lessons learned: Establishing Men-Only groups enabled men to explore gender norms without fear of judgment from women; and engage in honest self-reflection on GBV. Retention of males in three Men-Only groups was 6% higher than in 63 mixed-gender groups in Tsholotsho, with 1474 participants in six months; and is anticipated to increase as this approach is applied for longer periods. Engaging male PRT leaders primed credibility and encouraged increased male participation from the community as they can powerfully role-model positive masculinities, evidenced by those trained in SASA! Together.

Conclusions/Next steps: Scaling-up Men-Only groups contributed to improved male participation in SASA! Together, increased GNT, and engagement of males as partners in ending GBV.

EP1017

Coaching Boys Into Men (CBIM) and violence prevention intervention: perceptions of adolescents boys completing the CBIM Curriculum in the Copperbelt and North-western Provinces

R. Kanyinji[1], R. Mwilu[1], M. Sonka[2], B. Walusiku-Mwewa[3], G. Chanda[4], E.K. Nyundu[1]

[1]Access to Health Zambia, USAID Empowered Children and Adolescent Program I, Lusaka, Zambia, [2]Grassroot Soccer Zambia, Lusaka, Zambia, [3]Access to Health Zambia, Lusaka, Zambia, [4]USAID/Zambia, Lusaka, Zambia

Background: Gender-based violence (GBV) refers to any act done to someone against their will because of gender-norms, and unequal power relationships and the main perpetrators of GBV are predominantly men and boys. Globally, one in three women have experienced violence at least once in their lifetime. In Zambia, GBV is a serious public health and social problem.

According to the Zambia Demographic Health Survey (2018), 36% of women have experienced physical violence since age 15 while 17% of women have experienced sexual violence. GBV has affected women, especially in the reproductive age, leading to maternal mortality and other adverse health and social outcomes.

Description: USAID Empowered Children and Adolescents Program I is implementing community group-based interventions aimed at reducing violence targeting adolescent boys aged 10-14 in nine high HIV burden districts in the Copperbelt and North-western provinces. The adolescent boys participate in 12 sessions of CBIM over a period of 3-5 months and learn about respect, integrity and

non-violence behaviour, including avoiding cyberbullying, towards women and girls. These topics are designed to help adolescent boys to grow up as responsible adults that avoid violence.

Lessons learned: The intervention has resulted in adolescent boys to have increased knowledge about violence and HIV prevention, improved decision making, as well as being assertive and responsive to violent environments. From 2021Q1 to 2024Q4, the project reached 56,177 adolescent boys with the CBIM curriculum, which translates to 117.3% achievement.

Further, 97% demonstrated knowledge of different forms of harassment, abuse, and sexual violence and would safely intervene to stop disrespectful sexual behaviour.

Conclusions/Next steps: The intervention has resulted in increased knowledge on GBV and HIV prevention among adolescent boys while increase their assertiveness and responsiveness to violent environments. There is need to scale-up similar group-based intervention to targeted adolescent boys to reduce violence perpetuation among men and boys.

EP1018

Overcoming barriers to viral suppression: the role of viremia clinics for People Living with HIV in Kwara State, Nigeria

A. Amusan[1]

[1]University of Ibadan, Health Promotion and Education, Ilorin, Nigeria

Background: Despite massive investment and supports for people living with HIV (PLHIV) to attain the 95% viral suppression benchmark, there exist repeated challenges for some clients, which clog their progress to viral suppression. This study assessed the barriers being experienced by clients and the impacts of Viremia Clinic in enhancing viral suppression among PLHIV in Kwara State, Nigeria.

Methods: The study utilized retrospective design. 344 unsuppressed viral load results were received in March, 2023 from six selected high volume facilities in Kwara State, Nigeria. Viremic clinic data were used to identify their reported barriers during their first EAC. Barriers were identified using the EAC Barrier Assessment Form. All were recruited into focused intervention through the viremia clinic and adopted Health Belief Model (HBM) that focused on client-centered adherence counseling, peer mentoring, caregiver engagement, and differentiated service delivery models. Pre-and post EAC viral load results were used to measure virological re-suppression rates.

Results: Of the respondents, 209 were females and 135 were males aged between 18–65 years. The viral load for these patients ranged between 1,500 to 50,000 copies/ml. The identified barriers to adherence included psychological factors of depression and stigma at 20.5%, behavioral factors of missed doses and irregular dosage at 58.4%, pharmacological issues of side effects and drug-drug interactions at 16%, and financial constraints of high transportation costs and food insecurity at 2%. Assessment on post-EAC virological suppression was 83.7%. Suppression rates varied between facilities: the highest rate at 95%, as indicated by Children Specialist Hospital, Centre Igboro, Kwara State, Nigeria, while other sites range from 65%. Suppression among females was higher-90.4% than in males, which stood at 73.3%.

Conclusions: PLHIV experience various barriers that impede their journey to viral suppression. Viremia Clinic evidently improved virological suppression among unsuppressed clients through Enhanced Adherence Counselling. Exploring various barriers being experienced by clients should be sustained to continue to guide targeted interventions using the viremia clinic platforms.

EP1019

Breaking barriers: empowering male champions to boost HIV testing among men in a pastoral community in Northeastern Uganda

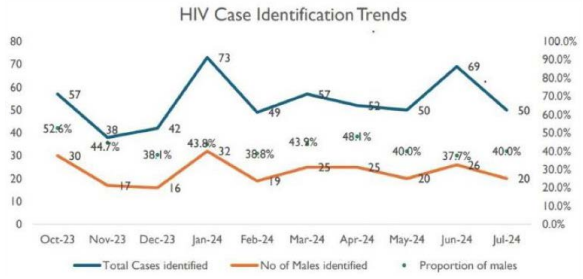
H.R. Chelangat[1], R. Nekaka[1], I.M. Neumbe[1], F. Kazibwe[1], D. Tindyebwa[2]

[1]Anecca, Technical, Moroto, Uganda, [2]Anecca, Technical, Kampala, Uganda

Background: Karamoja region in northeastern Uganda faces significant barriers to HIV case identification among men due to cultural norms, stigma, poor health-seeking behaviour, and limited access to healthcare facilities. These challenges hindered progress toward achieving the first 95 target: ensuring 95% of people living with HIV know their status

Description: From October 2023 to July 2024, influential male community members, known as Male Champions, were engaged to address barriers through a culturally sensitive, person-centred approach. The Male Champions conducted outreach activities in informal settings such as markets and religious gatherings, promoted HIV testing, distributed HIV self-testing kits, and referred those with reactive results for confirmatory testing at health facilities.

Lessons learned: This initiative led to a 34% increase in HIV testing rates among men, with new HIV-positive cases exceeding the monthly target of 13. Over 2,544 HIV self-testing kits were distributed, with a 95% uptake rate. All those who tested positive were successfully linked to care within two weeks. Community dialogues also helped reduce myths and misconceptions about HIV testing.



Conclusions/Next steps: Community engagement is crucial for ensuring sustainability in initiatives, as it fosters local ownership and participation. Adapting training materials to fit local contexts enhances effectiveness, making interventions more relevant and impactful. The Male

Champions initiative significantly improved HIV case detection and testing among men in Karamoja, highlighting the value of tailored, community-driven approaches in increasing access to HIV services.

EP1020

Unlocking post-exposure prophylaxis access: enablers and barriers to eligibility, initiation and completion in Karamoja region, Northeastern Uganda

I.M. Neumbe[1], R.H. Chelangat[1], M. Narika[1], R. Chepkurui[1], R. Nekaka[1], D. Tindyebwa[2]
[1]Anecca, Technical, Moroto, Uganda, [2]Anecca, Technical, Kampala, Uganda

Background: Post-Exposure Prophylaxis (PEP) is a critical intervention for preventing HIV transmission following potential occupational and non-occupational exposure. Despite its availability, various factors hindered the initiation and completion of PEP particularly among survivors of sexual violence in Karamoja region.
This initiative aimed to identify enablers and barriers to PEP eligibility, initiation, and completion among Sexual and Gender Based Violence (SGBV) survivors and explore perspectives of healthcare workers and community structures on delivering PEP services in Karamoja.
Description: A qualitative exploration of enablers and barriers was conducted utilizing a semi-structured questionnaire administered to 44 SGBV survivors, 48 health workers and 68 community resource persons.
Lessons learned: Barriers to seeking timely care included fear of disclosure, lack of family support, lack of information, and misconceptions about HIV transmission. PEP initiation was hindered by misinformation from peers, and fear of side effects.
Challenges to PEP completion involved fear of a partner's reaction, side effects, and social discrimination. Enablers of PEP access and initiation included family and social support, advice from friends, proximity to health facilities, and provider recommendations.
Completion of PEP was facilitated by counseling, family support, and medical guidance. Health worker perspectives highlighted late reporting after 72 hours causing non-eligibility while community resource persons cited lack of resources, cultural issues, and fear of retaliation as challenges. Survivors often declined referrals to health facilities due to fear of exposure, shame and family influence.
Conclusions/Next steps: These findings highlight complex social, cultural, and medical factors that impact the effectiveness of PEP interventions. Addressing these challenges requires community education, stigma reduction, and social support systems for timely and complete access to PEP for SGBV survivors.

EP1021

Disability-inclusive HIV prevention: impact of the no means no program in preventing sexual and gender-based violence among adolescent girls and young women with disability in Niger State, North-Central, Nigeria

L. Mohammed[1], H. Nuhu Dikko[1], K. Eruchalu[1], I. Pious[1], F. Mairiga[2], A. Abubakar[3], P. Mungwari[4], D. Stotesbury[4], D. Magaji[5]
[1]Society for Family Health, Abuja, Nigeria, [2]Save the Children International, Abuja, Nigeria, Nigeria, [3]American International Health Alliance, Abuja, Nigeria, [4]No Means No Worldwide, McLean, United States, [5]United States Agency for International Development, Abuja, Nigeria

Background: Women and girls with disabilities are more vulnerable to sexual and gender-based violence (SGBV), which increases the risk of acquiring HIV. The inclusion of people with disabilities-PWD (15% of the global population) is essential to drive HIV prevention *(UNAIDS)*.
This study evaluated the impact of No Means No in preventing SGBV among adolescent girls and young women (AGYW) with hearing and speech impairment aged 9-22, under the Integrated Child Health and Social Services Award (ICHSSA 3), funded by USAID.
Methods: We developed a Beneficiary Disability-Inclusion Framework and conducted a Disability-Inclusion Assessment to identify PWD for HIV prevention. The government approved the implementation of No Means No at the Niger State School for Special Education. We engaged 4 volunteer sign-language interpreters among female teachers. We trained 4 students–AGYW with hearing and speech impairment as instructors on a 10-hour No Means No curriculum to teach their fellow students the skills to prevent SGBV. The AGYW instructors trained fellow students in 9 cohorts (N=231) over 8 months (March-October 2024). We sampled 5 training cohorts (*n*=138) to measure the change in knowledge and attitude through pre/post-test, focused-group discussions with AGYW, and key informant interviews with teachers. We identified 21 peer educators and mentored them to teach their peers. We supported disclosures and established referral networks for survivors of SGBV.
Results: The immediate knowledge of SGBV prevention increased by an average of 200% (pre-test 31%, post-test 93%). The average change in attitude was 83% (pre-test 52%, post-test 96%). While the participants had 84% awareness of SGBV in their community, their empowerment self-defense skills for preventing SGBV was 17% at baseline. The post-test improved to 93% with an average change of 433%. 2 AGYW instructors volunteered to educate the members of the Niger State Association of the Deaf on SGBV prevention. 21 peer educators taught their peers sexual violence prevention skills.
Conclusions: The No Means No is an effective disability-inclusive HIV prevention intervention that reduces SGBV among PWD. This study recommends scaling up the No Means No and integrating disability-inclusive HIV prevention services into healthcare systems to improve HIV prevention.

EP1022

Transgender and MSM Beauty Pageants as an advocacy initiative to promote HIV awareness and testing - the experience of the Rajah Kay Diwata (King and Goddess) Program in the Philippines

L.B. Norella[1], M.L. Diones[2]
[1]Pilipinas Shell Foundation, Inc. (PSFI), HIV PROTECTS UPSCALE Grant Unit, Taguig CIty, Philippines, the, [2]Family Planning Organization of the Philippines (FPOP), Iloilo Chapter, Iloilo CIty, Philippines, the

Background: The Western Visayas Region in the Philippines is ranked 6th in the country based on HIV prevalence. More than 85% of new cases are due to sexual transmission mostly occurring among males who have reported same-sex higher risk sexual behaviors. MSM and Transgender Women have the highest risk for HIV in the Region.

To promote HIV awareness, prevention and testing among this key population groups, the FPOP Iloilo Chapter, has initiated the Rajah Kay Diwata (King and Goddess) HIV Advocacy Program that uses Pageantry and Beauty Contests to deliver HIV messages, drive PrEP enrollment and promote HIV Testing uptake.

Description: Started in 2018, the Rajah Kay Diwata or RKD HIV Advocacy Pageant and Outreach Program is a 4 to 6 months long initiative that bring together candidates coming from the Transgender and MSM Communities of Iloilo Province, to become actively involved in the HIV and wellness advocacy. Their advocacy activities also encourage them to recruit or refer KP clients from among their peers for HIV testing.

These activities culminate in a major beauty pageant event where a new set of Rajah Kag Diwata winners are declared. The winners will then start a yearlong commitment to continue working on the AIDS advocacy as HIV Ambassadors.

Lessons learned: Since its inception, the RKD Program has produced a roster of more than 100 peer educators who come from their pool of candidates. They outreach work of the RKD contestants has been documented to lead to increased HIV testing uptake as well as increases in PrEP enrollment among TG and MSM communities, especially among young people.

Conclusions/Next steps: Majority of those who stayed on as volunteer peer educators after their reign as the RKD winners, expressed that their participation in the RKD program did not only boost their self-confidence, but has also provided them with a new set of friends that serve as their strong base of support in continuing their HVI advocacy work.

It is a common recommendation for RKD to be continued as a significant event every year and also be expanded towards a wider reach among TG and MSM communities in the Western Visayas Region.

Integration of HIV services with other health and support services

EP1023

Best practises enhancing horizontal integration of services for communicable(CDs) and non-communicable (NCDs) diseases in Mutuini Hospital (MH) in Maternal and Child Health (MCH) department since May 2024

L. Ouma[1], F. Obwanda[2], B. Bosire[3], P. Amata[4], M. Mutune[5], E. Mutiso[6], G. Warren[7], W. Kariuki[8]
[1]Mutuini Hospital, Maternal and child health, Nairobi, Kenya, [2]Mutuini Hospital, Chief executive officer, Nairobi, Kenya, [3]Mutuini Hospital, Pharmacist, Nairobi, Kenya, [4]Mutuini Hospital, Medical superintendent, Nairobi, Kenya, [5]Mutuini Hospital, Nursing manager, Nairobi, Kenya, [6]CIHEB, PMTCT/MCH, Nairobi, Kenya, [7]Cooperative University, Statistics and information technology, Nairobi, Kenya, [8]CIHEB, PMTCT, Nairobi, Kenya

Background: WHO recommends horizontal integration of healthcare services because of affordability, sustainability and effectiveness. Notably, nonintegration of healthcare services weakens healthcare system. In MH, various partners; CIHEB, DREAMS, Marie Stopes & community health volunteers (CHVs) supporting services aligned to MCH have been provided for space within the MCH department since May 2024 and are all supervised by MCH nurse in charge for sustainability and coordination.

Description: Previously, these partners worked independently which culminated to numerous cases of pre-eclampsia, HIV seroconversion in PNC after initial negative HIV result, anaemia in labour, missed clinic appointments, data inconsistency and clients rejecting some services that involved moving to different departments.

This abstract illustrates how horizontal integration has enhanced fight against CDs and NCDs in MH at MCH department in pregnant and breastfeeding clients since May 2024**:** Horizontal integration of services approach has been used to render MCH services to gravid and lactating mothers from May 2024 to present (November 2024).

Lessons learned: Active uptake of available services positively impacted client outcomes. Out of 6595 clients, 650 (10%) were referred by CHVs and submitted referral forms at the CHV's desk at the waiting bay.

320 (5%) adolescent girls and young women bellow 24 years were enrolled for DREAMS services to get monthly supply of sanitary towels, artisan course trainings, free family planning services by Marie Stopes and 85 (3%) clients who reported gender based violence got minimum package of care.

6595 (100%) were done for antenatal profile to screen for syphilis, HIV, Hepatitis B, diabetes mellitus, anaemia, hypertension and all were triaged.

3045 (46%) First ANC clients were tested for HIV and 3028 (95%) had HIV negative result, out of which 260 (8%) high risk clients accepted PrEP while 20 (0.7%) who were newly diagnosed with hypertension were linked to special clinic. 8 (0.3%) had Hepatitis B and were linked to care and treatment. 150 (5%) had HB <11g/dl and were treated.

17 (0.5%) of clients who got positive HIV test results were linked to care and treatment by CIHEB. All services were entered into KeEMR real time.
Conclusions/Next steps: Horizontal integration of services can enhance fight against communicable diseases and non-communicable diseases due to affordability, sustainability, good client outcomes and effectiveness.

EP1024

Care pathway for newly diagnosed clients living with HIV/PTB in South Africa

L. Tokwe[1], P.J. Jordan[1], R.R. Marie Modeste[1]
[1]Stellenbosch University, Nursing and Midwifery, Cape Town, South Africa

Background: Globally, approximately 39.9 million people were living with Human Immunodeficiency Virus (HIV) in 2023. In South Africa, an estimated 8.0 million people were living with HIV in 2024. While the number of People Living with HIV (PLWH) is increasing every year, they become prone to developing other co-morbidities such as Pulmonary Tuberculosis (PTB). The PTB is a common opportunistic disease in PLWH. South Africa is burdened with HIV/PTB diagnosis. The literature further reports that the HIV/PTB is poorly integrated in the Primary Health Care (PHC). However, it remains unclear if there is a care pathway focusing on the newly diagnosed clients living with HIV/PTB in PHC clinics. Therefore, the aim of this study was to develop a care pathway for newly diagnosed clients living with HIV/PTB in the PHC clinics in South Africa.
Methods: The National Council on Mental Wellbeing seven (7) steps underpinned the care pathway development. Out of the seven (7) steps, five (5) were applied. A multiphased approach was employed. Phase One was a scoping review, phase Two and phase Three were qualitative studies. The design was exploratory, descriptive and contextual. The data was analysed using Tech's eight steps. The data was later integrated at findings and interpretation level. The data sets from the three (3) phases informed the development of the care pathway as phase Four.
Results: The care pathway was developed for the health care team caring for clients living with HIV/PTB in the PHC clinics as end users. The care pathway follows a nine (9) stepwise approach for managing newly diagnosed clients living with HIV/PTB. The care pathway was later reviewed by eleven (11) expert panel members within PHC and all the suggestions made were amended and incorporated in the final care pathway.
Conclusions: An integrated intervention is needed by the health care team working in the PHC clinics to better manage newly diagnosed clients living with HIV/PTB. In this study, a care pathway was developed for the health care team working in the PHC clinics so that they manage newly diagnosed clients living with HIV/PTB. This care pathway developed is the first of its kind in the PHC clinics. The care pathway has a potential to improve the health outcomes of newly diagnosed clients living with HIV/PTB in the PHC clinics. Future research is needed on implementation and testing of this care pathway in the rural PHC clinics.

EP1025

Integration of healthcare services for HIV and non-communicable diseases in sub-Saharan Africa: a scoping review of randomized controlled trials and protocols

C.A. Bulstra[1,2,3], L. Murphy[4,3], B.M. Wamuti[5,6], J.T. Figi[1,3], K. Ngure[7], A. Fladger[8], T. Bärnighausen[2,9], T. Apollo[10], R. Atun[1,3]
[1]Harvard T.H. Chan School of Public Health, Department of Global Health and Population, Boston, United States, [2]Heidelberg University Medical Center, Heidelberg Institute of Global Health, Heidelberg, Germany, [3]Health Systems Innovation Lab, Department of Global Health and Population, Boston, United States, [4]Harvard College, Cambridge, United States, [5]University of Washington, Department of Global Health, Seattle, United States, [6]Harvard Center for Population and Development Studies, Cambridge, United States, [7]Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya, [8]Harvard Medical School, Harvard University, Countway Library, Boston, United States, [9]Africa Health Research Institute (AHRI), Durban, South Africa, [10]Ministry of Health and Child Care, Harare, Zimbabwe

Background: Stand-alone HIV clinics in sub-Saharan Africa (SSA) have effectively expanded antiretroviral therapy, enabling the transformation of HIV into a chronic condition. However, the rising prevalence of non-communicable diseases (NCDs) in SSA, coupled with the higher risk of NCDs like cancers, hypertension, and diabetes among people living with HIV, necessitates provision of integrated health services for HIV and NCDs. This scoping review examines current HIV-NCD integration models and measured outcomes.
Methods: We searched Embase, MEDLINE, Web of Science, Global Health, and Africa Index Medicus for randomized controlled trials (RCTs) and RCT protocols on HIV-NCD healthcare integration in SSA, published in English or French from January 1, 2010, to October 1, 2024. Data on study design, intervention details, outcomes, findings, and locations were extracted to identify patterns, research gaps, and provide a comprehensive overview of integrated service models.
Results: Out of 5,266 identified studies, 25 were included, consisting of 8 RCTs and 17 RCT protocols from 10 SSA countries: Botswana, Cameroon, Kenya, Malawi, Mozambique, Nigeria, South Africa, Tanzania, Uganda, and Zimbabwe. RCTs started between 2013 and 2024, with durations ranging from 1 to 7 years (mean 3.08 years). Included studies focused on integrating health services for HIV with depression (9 studies), hypertension (6), hypertension and diabetes (4), substance use therapy (3), and (cervical) cancer (3). Integration mostly occurred in primary care clinics (13 studies) and stand-alone HIV clinics (4 studies).
Common outcome measures included ART adherence, retention in HIV care, and HIV viral suppression, though metrics varied widely by disease outcome and care-cascade step.
Conclusions: While several RCTs on HIV-NCD integration exist, heterogeneity in models, settings, and outcome measures limits comparability. The focus on HIV out-

comes and diverse metrics highlights the need for standardized measures to assess integration effectiveness. Additionally, the short duration of most trials constrains long-term evaluation of effects, underscoring the need for extended timelines to fully understand the potential and sustainability of HIV-NCD integrated care.

EP1026

Integrating HIV testing into TB community-based programs for pregnant women: a model for dual disease screening and improved maternal health – KNCV Nigeria experience

S. Batur[1]
[1]KNCV Nigeria, Abuja, Nigeria

Background: Tuberculosis (TB) and HIV remain leading causes of morbidity and mortality among pregnant women in high-burden settings. Integrating HIV testing into community-based TB programs offers a unique opportunity to address these dual epidemics while improving maternal and child health outcomes.
This abstract highlights the experience of KNCV Nigeria in implementing an integrated TB/HIV screening model for pregnant women.
Methods: The initiative was piloted across KNCV Global fund supported states, targeting pregnant women attending antenatal care (ANC) at unconventional centres and those who are at home. Key components included:

1. Training community TB/HIV workers (CTHWs) on dual TB and HIV screening protocols.
2. Incorporating HIV rapid testing into routine TB screening activities.
3. Establishing referral linkages for confirmatory diagnosis and treatment for TB and HIV-positive cases.
4. Data on screening uptake, positivity rates, and linkage to care were collected and analyzed from January-December,2024.

Results:

- A total of **3,500 pregnant women** received both TB and HIV testing through the integrated program.
- **HIV positivity rate** among those tested was **4.5%** (n=158), which aligns with regional HIV prevalence data but highlights cases that may have gone undiagnosed without integration.
- **Linkage to HIV care** was successfully achieved for **95% of HIV-positive women**, with 150 women initiating antiretroviral therapy (ART) within two weeks of diagnosis.
- Qualitative feedback from participants indicated that **85% found the integrated approach more convenient** and reported a **strong preference** for comprehensive services within one visit.

Conclusions: Integrating HIV testing into TB programs for pregnant women is effective in identifying undiagnosed HIV cases and linking women to care, significantly improving maternal health outcomes in high-risk communities.
This approach has high acceptance among participants and enhances the efficiency of healthcare delivery in settings where accessibility is limited. Scaling this model could contribute to more holistic maternal health services and advance efforts toward eliminating mother-to-child transmission of HIV.

EP1027

Perspectives on integration of chronic disease care with LAI-ART injection visits

E. Niehaus[1], K. McKenna[2], A. Corneli[2], C. Muiruri[2], N.L. Okeke[1]
[1]Duke University, Department of Medicine, Division of Infectious Diseases, Durham, United States, [2]Duke University, Department of Population Health Sciences, Durham, United States

Background: Long-acting injectable (LAI) anti-retroviral therapy (ART) for treatment of HIV entails more frequent healthcare interactions than standard care, offering an opportunity to optimize the monitoring and management of comorbid chronic diseases.
In this qualitative study, we explored decision-making involved in LAI-ART uptake and assessed perspectives towards a bundled care model whereby services addressing non-HIV health conditions could be incorporated into LAI visits.
Methods: We conducted in-depth interviews with 8 people on LAI-ART and 16 people on oral ART. People with HIV (PWH) who are virally suppressed, have one or more common chronic medical conditions, and are seen at Duke University clinics were eligible to participate. We used the Transtheoretical Model of Change to guide the interviews and analyzed the data using inductive thematic analysis.
Results: Among those on oral ART, participants staged themselves in the pre-contemplative (n=8), contemplative (n=6), or planning (n=2) phase of LAI uptake. Factors facilitating LAI-ART uptake included convenience, pill burnout, and poor tolerability of oral ART, while barriers to uptake included frequent clinic visits, dislike of injections, inadequate knowledge, and stability of current care. Many participants said that their HIV provider plays an important role in their consideration of LAI. All participants on LAI expressed satisfaction with their treatment.
Despite the diversity in perspectives on LAI-ART as a personal treatment choice, nearly all participants viewed a bundled care model to be potentially beneficial, though some expressed that it would depend on the service(s) provided. The integration of mental health services and social work services to LAI visits were viewed as helpful for most participants, as many described these as gaps in their current care. Services addressing cardiovascular disease risk through blood pressure management were also viewed favorably by many, though others felt their blood pressure was optimized already. Several participants on oral ART expressed that adjunctive services offered during LAI visits might influence their decision-making in favor of uptake.
Conclusions: Integration of chronic disease management and social support services into bimonthly LAI-ART visits is perceived as both acceptable and beneficial to PWH. Future research should focus on implementation strategies for leveraging LAI visits to optimize chronic disease outcomes.

EP1028

Adaptation of the Transitional Care Model to address gaps in post-hospitalization care among adults with HIV/non-communicable disease comorbidity in Malawi

W.T. Dunda[1], C. Chawinga[1], E. Kumwenda[1], M. Chagomerana[1], E. Rambiki[2], A. Bula[1], M.C. Hosseinipour[1], C. Kanyama[1]
[1]UNC Project Malawi, Qualitative, Lilongwe, Malawi, [2]Lighthouse Trust, Lilongwe, Malawi

Background: Despite antiretroviral therapy (ART), African hospitals face high admissions of people with HIV (PWH) due to advanced HIV and comorbid non-communicable diseases (NCDs). A significant care gap lies in inadequate discharge planning and post-hospitalization support. To address this, we collected data to adapt the US-based Transitional Care Model (TCM) in Malawi. TCM, a nurse-led intervention, supports transitions from inpatient to home care to improve post-discharge outcomes and reduce readmissions or mortality among high-risk adults. Our objective was to collect formative qualitative data to guide the adaptation of the TCM for PWH hospitalized with NCDs in Malawi.
Methods: Guided by the PRISM framework, we purposively selected 50 participants for in-depth interviews in Lilongwe, Malawi: 20 health workers, 10 patients with HIV/NCD comorbidity who were recently hospitalized, 10 caregivers, and 10 key informants. Interviews were conducted in Chichewa and English, audio-recorded, transcribed, and translated into English. Data were coded using Nvivo 14 and analyzed through thematic analysis.
Results: The TCM highlights key elements for bridging inpatient and post-discharge care, that includes coordination between inpatient and outpatient services, nurse-patient relationships, continuity of care, and engaging family caregivers. Our findings revealed fragmented discharge planning and post-hospital care, leading to poor patient follow-up. Effective communication from admission between health care workers and patient/caregiver can mitigate these issues. Early discharges from bed shortages, patient/caregiver fatigue, or financial strain were prominently reported as a contributor for poor post discharge outcomes. Post-discharge challenges include persistent symptoms due to early discharges, financial difficulties, and insufficient medication, worsened by comorbidities, which hinder income generation and increase the burden of multiple medications and appointments. Home-based care was viewed positively for its convenience, cost savings, and morale-boosting effects. It also offers better patient assessment for at risk of readmission/poor outcomes. Phone follow-ups and hotlines were suggested as viable tools to improve healthcare access and support.
Conclusions: These findings highlight the critical need for discharge planning and post-discharge care for patients with chronic and complex conditions. Lessons from early discharges underscore the importance of follow-up in home settings. The TCM appears feasible for Malawi, promoting coordinated care and improved health outcomes.

EP1029

Optimizing cervical cancer screening among women living with HIV in 2024: a strategy to improve cervical cancer screening among women living with HIV in Eastern Province, Zambia

T. Malebe[1], M. Chilambwe[1], C. Magumba[1], S. Sifaya[1], H. Satti[2], F. Walker[3], M. Ngambi[4], M. Goma[1], P. Mutale[1], J. Msofe[5], L. Mwiinga[6], J. Mukundu[1], A. Chomba[1]
[1]FHI 360, HIV, Lusaka, Zambia, [2]FHI 360, HIV, Dubai, United Arab Emirates, the, [3]FHI 360, HIV, Washington, United States, [4]Ministry of Health, Health, Chipata, Zambia, [5]FHI 360, HIV, Dar-es-salaam, Tanzania, the United Republic of, [6]CDC Zambia, Public Health, Lusaka, Zambia

Background: In 2022, cervical cancer emerged as one of the leading cancers affecting women globally, with nearly 660,000 new diagnoses and around 350,000 fatalities. FHI360 provides technical assistance to Eastern Province Health Office (EPHO) through U.S. Centers for Disease Control and Prevention (CDC) under the President's Emergency Plan for AIDS Relief (PEPFAR) funding. Women Living with HIV (WLHIV) aged 15 years and above are provided routine cervical cancer screening and treatment services across 15 districts of Eastern Province, Zambia.
Description: A total of 70,432 WLHIV aged 15 years and above were active on HIV treatment by September 2024 in Eastern Province. The province employed a combination strategy to ensure that all eligible WLHIV are screened for cervical cancer by Visual Inspection with Ascetic Acid (VIA) or Human Papillomavirus (HPV) DNA testing.
This strategy includes:
1. Optimizing appointment system by Cervical Cancer Champions using an appointment system that ensures all eligible women are identified, scheduled and message reminders are sent;
2. Targeted outreach services in zones;
3. Increase number of health care workers trained in combined VIA, HPV and Loop Electrosurgical Excision Procedure (LEEP) package to cumulative total of 280 (75 Health Care Workers (HCWs) in 2024 compared to 60 in 2023), and;
4. Redesigning client flow to integrate cervical screening within ART setting.
Lessons learned: A total of 18,945 WLHIV were screened in 2024 using either VIA or HPV testing, a 15% increase from the 16,488 screened in 2023. Of the 18,945 total screened in 2024, 17,413 (92%) were screened using VIA, while 1,532 (8%) were screened using HPV testing.
Further, of the 17,413 VIA-screened, 501 (2.9%) screened VIA positive, of which 121 (24%) were referred for further investigation as were suspected to have cervical cancer. Of the total 1,532 that were screened using HPV testing, 269 (18%) tested HPV positive.
Conclusions/Next steps: The combination of strategies led to a 15 % increase in cervical cancer screening coverage among the WLHIV in Eastern Province within a year. But there is room to continue increasing HPV screening. These successful strategies can be expanded to other areas.

EP1030

Uptake of community blood pressure monitoring and associated factors among people living with HIV and hypertension accessing integrated care at selected HIV clinics in Uganda

J.B. Kiggundu[1], R. Ndejjo[2], D. Guwatudde[3], F.C. Semitala[1]
[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]Makerere University School of Public Health, Disease Control and Enviromental Health, Kampala, Uganda, [3]Makerere University School of Public Health, Epidemiology and Biostatistics, Kampala, Uganda

Background: World Health Organization recommends Community-based blood pressure monitoring (BPM) for diagnosis and management of hypertension. However, there is limited data on the uptake and factors associated with community BPM among people living with HIV (PLHIV) and hypertension in Uganda.
This study aimed to determine the uptake of, and factors associated with community BPM among PLHIV and hypertension receiving care at selected HIV clinics.
Methods: A cross-sectional study was conducted between May and July 2024 at three HIV clinics participating in an implementation trial (NCT05609513) in the Kampala and Wakiso districts. A total of 408 participants, proportionally distributed across the clinics, were randomly selected and surveyed using a pretested questionnaire. Descriptive statistics were performed, reporting means or medians with standard deviations (SD)/interquartile ranges (IQR) and frequencies with proportions for numerical and categorical variables, respectively.
Factors associated with community BPM uptake were assessed using bi-variable and multivariable modified Poisson regression. Data analysis was performed using STATA 14.1
Results: Of the 408 participants, 67.7% were female, mean age of 50.1 years (SD=10.7). All participants had been on HIV and hypertension medications for a median duration of 5 years (IQR: 3.5–7.2) and 1 year (IQR 1–1), respectively. Community BPM uptake was 27% (95% CI: 23.3–32.0). Among those monitoring their BP in the community, 68.6% did so at private clinics, 70% at pharmacies, 15.2% at public health facilities, and 5.4% self-monitored their BP.
Multivariable analysis indicated that the uptake of community BPM was associated with receiving three antihypertensive medications (adjusted prevalence ratio [aPR]: 2.2, 95% CI: 1.1–4.4), receiving advice from healthcare providers (aPR: 8.7, 95% CI: 3.7–20.5), receiving feedback on BP monitoring (aPR: 33.3, 95% CI: 4.1–268.6), and owning a BP device (aPR: 2.2, 95% CI: 1.3–3.5).
Conclusions: Community BPM uptake among PLHIV and hypertension was low. However, individuals receiving healthcare provider recommendations and feedback, owning BP devices, or on three antihypertensive medications were more likely to engage in community BPM.
To improve uptake and ensure continuity of care, targeted interventions such as healthcare provider counseling, feedback mechanisms, and facilitating access to BP devices are recommended.

EP1031

Understanding the burden of depression among persons living with HIV (PLHIVs) attending antiretroviral therapy (ART) clinics in Nigeria

V.O. Popoola[1], E. Nwabueze[2], E. Ijezie[3], N. Yibowei[4], M. Jkaisamba[5], L. Buzaalirwa[6], N. Dube[7], T. Popoola[8], P. Iutung[9]
[1]AIDS Healthcare Foundation, Medical Unit, Freetown, Sierra Leone, [2]AIDS Healthcare Foundation, Medical Unit, Abuja, Nigeria, [3]AIDS Healthcare Foundation Nigeria, Abuja, Nigeria, [4]AIDS Healthcare Foundation Nigeria, Monitoring and Evaluation, Abuja, Nigeria, [5]AIDS Healthcare Foundation Sierra Leone, Freetown, Sierra Leone, [6]AIDS Healthcare Foundation Africa Bureau, Quality, Kampala, Uganda, [7]AIDS Healthcare Foundation Africa Bureau, Quality, Manzini, Eswatini, [8]University of Newcastle, Nursing and Midwifery, Newcastle, Australia, [9]AIDS Healthcare Foundation Africa Bureau, Kampala, Uganda

Background: Mental health conditions such as depression can undermine the management of PLHIVs. Conversely, the psychological toll of living with HIV can worsen mental health conditions, creating a self-reinforcing vicious cycle that negatively impacts health and wellbeing if left unaddressed.
This study examined the burden of depression among PLHIVs attending ART clinics in Nigeria, with the aim of informing the design of more holistic and integrated care approaches.
Methods: A cross-sectional study was conducted using data from routine screenings of PLHIVs attending 17 AIDS Healthcare Foundation (AHF) supported ART clinics in 4 different States in Nigeria. The screenings, which were conducted over a period of 6 months in 2024, utilized the PHQ-9 tool to evaluate the frequency of depressive symptoms over the previous two weeks.
Scores ranged from 0 to 27, categorizing depression into 5 levels: no depression (0-4), mild depression (5-9), moderate depression (10-14), moderately severe depression (15-19) and severe depression (20-27).
Statistical analysis was performed using Python to summarize the data, and chi-square test was applied to examine the relationships among respondents' variables.
Results: Among 1,157 PLHIVs screened, 341 (29.5%) were males and 816 (70.5%) females, with an average age of 38 years (±12). The majority, 948 (81.9%), were old clients (>6 months in care), while 209 (18%) were newly enrolled.
Overall, 134 (11.6%) had some form of depression: 88 (7.6%) mild, 30 (2.6%) moderate, 12 (1.0%) moderately severe, and 4(0.4%) severe. Newly enrolled clients exhibited significantly higher depression rates (27.8%) compared to old clients (8.0%), with 75% of severe depression cases found among newly enrolled individuals.
Depression rates among women (11.8%) were slightly higher than men (10.9%), and all moderately severe or severe cases were female. Chi-square and logistic regression analysis revealed a significant relationship between depression and being newly enrolled ($p < 0.001$), but no significant association with gender ($p = 0.222$) or age

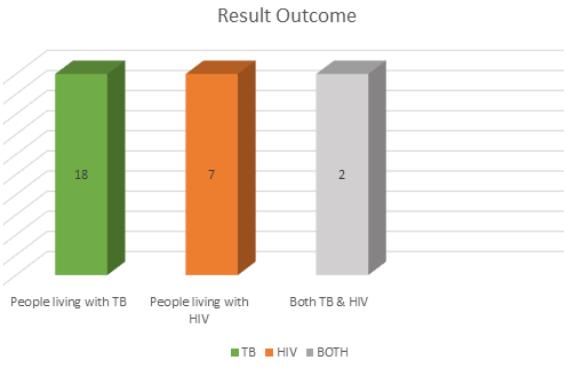
group (p = 0.147). The PHQ-9 question "Feeling down, depressed, or hopeless?" was identified as the most predictive of depression.
Conclusions: The study highlights notable burden of depression among PLHIVs in Nigeria and these findings underscore the critical need for integrated mental health services within HIV care, with a focus on early screening and targeted support for newly diagnosed individuals.

EP1032

Integrated HIV screening and portable digital xray (PDX) intervention: insights from world AIDS day 2023 in Baure LGA IDP camps of Katsina state, North West Nigeria

F. Mathew[1]
[1]University of Calabar, Cross River State, Radiography and Radiological Science, Calabar, Nigeria

Background: Over a decade of insurgency, mass displacement, and the destruction of basic infrastructure in Northwest Nigeria. Internally displaced persons (IDPs) suffering from lack of basic hygienic conditions, malnutrition, and disease live in camps or are hosted by communities in the region, where the conflict has contributed to a massive destruction of health facilities. Infectious diseases like tuberculosis (TB) and HIV are especially difficult to address under such conditions, and IDPs are vulnerable to both.
Description: The portable digital xray with computer aided detection for TB (CAD4TB) was deployed to Baure LGA to screen for TB and a focal person for HIV was included in the team to screen for HIV alone.
The clients' chest xray was taken for TB screening with the help of CAD4TB and nasal collection or blood sample was also collected for HIV screening by the HIV screener using rapid diagnostic kit. Presumptive client's sputum was collected in sputum cups and tested for TB using Genexpert machine while the HIV tester uses the rapid test kit to screen.



Lessons learned: Between December 4-8, 2023 ACF was conducted in 5 IDPs camps and 9 host communities in Baure LGAs of Katsina state. A total of 504 clients were screened for both TB and HIV, 323 (55.6%) women and 181 (44.4%) men, Identified 52 presumptive for TB and all samples were evaluated.
We detected 18 PLTB, 7 PLHIV, 2 coinfected and were all linked to TB therapy and antiretroviral treatment respectively via the local government focal persons. Through this approach, TB and HIV case notification increased by 12% and 8% respectively allowing for timely intervention, better treatment outcome and control.
Conclusions/Next steps: This study calls for upscale to greatly increase case notifications, It is crucial to adopt such approaches so as to provide sustained solutions to these and other health crises among vulnerable populations.

EP1033

Integrating HIV, TB, STIs, and hepatitis services for sex workers, PLHIV, and co-morbid populations: a one-window approach to enhance dignified, stigma-free, and holistic care delivery

M.I. Shahid[1], K. Akhtar[1], M. Hanif[1], MZ. Ali[2]
[1]Active Help Organization (AHO) (Reg) NGO, HIV/AIDS Prevention and Treatment, Lahore, Pakistan, [2]University of Okara, Microbiology and Molecular Genetics, Okara, Pakistan

Background: Sex workers, people living with HIV (PLHIV), and individuals with co-morbidities such as TB, STIs, and Hepatitis B & C often face fragmented healthcare systems, stigma, and discrimination. To address these challenges, Active Help Organization (AHO), in collaboration with the District Health Authority Okara, piloted a one-window service delivery model in Okara, Pakistan, from January to June 2020.
This model aimed to integrate HIV, TB, STIs, and Hepatitis services under one roof, ensuring accessible, dignified, and stigma-free care for marginalized populations.
Description: The program operated through strategically selected healthcare facilities in Okara, targeting sex workers, PLHIV, and TB-affected communities. Services included integrated testing, treatment, and prevention, with additional baseline services such as PEP, and Hepatitis B vaccinations.
Key interventions included provider training to ensure rights-based care, community engagement to reduce stigma, and robust referral systems for specialized services. The program was designed to streamline access, enhance patient experience, and improve health outcomes.
Lessons learned: The pilot demonstrated that integrated service delivery significantly improves accessibility and utilization. Testing rates for HIV, TB, and Hepatitis increased by 40%, while patient drop-out rates decreased by 30% due to co-located services. Patients reported high satisfaction with respectful and stigma-free care.
Community engagement and interdepartmental coordination were identified as critical factors in the program's success.
Conclusions/Next steps: The findings underscore the importance of holistic and stigma-free care models in addressing the needs of vulnerable populations. Expanding this model to other districts could strengthen national health responses.
Future steps include scaling the program, advocating for integrated health policies, and leveraging digital tools for outreach and monitoring. This pilot provides a repli-

cable framework for delivering comprehensive, equitable healthcare, advancing global goals for HIV prevention, treatment, and care.

EP1034

Navigating implementation challenges for preventive lung health assessments at a publicly funded antiretroviral therapy center for people living with HIV in Pune, India

S. Nimkar[1], R. Borse[2], I. Ansari[2], N. Suryavanshi[1], P. Padriwad[1], S. Londhe[1], K. Zarekar[1], A. Pawar[1], H. Bhosale[1], S. Surwase[1], G. Lele[1], V. Potphode[1], V. Mave[1,3], I. Marbaniang[1,4]

[1]B J Medical College -Johns Hopkins University Clinical Research Site, Pune, India, [2]B J Govt Medical College & Sassoon General Hospitals, Pune, India, [3]Johns Hopkins University, Baltimore, United States, [4]McGill University, Montreal, QC, Canada

Background: People living with HIV (PLHIV) are at higher risk of lung morbidities, making lung health assessments (LHA) a potentially important measure for secondary prevention. Despite publicly funded settings being the primary source of healthcare for most PLHIV in low-and-middle-income countries (LMICs), implementing LHA within these settings poses unique challenges.

Here, we outline key challenges from an LHA conducted at BJ Government Medical College, Pune, India, to inform future efforts.

Description: Using a pragmatic non-randomized approach, 397 PLHIV were enrolled from January 2023 to January 2024. Participants completed computer-assisted questionnaires and underwent high-resolution chest computed tomography (HRCT) and spirometry under the supervision of trained study staff.

Implementation challenges were systematically documented and thematically categorized using the Consolidated Framework for Implementation Research (CFIR). Participant feedback on study procedures was collected and integrated with thematic findings to identify barriers and facilitators.

Lessons learned: Challenges and facilitators were identified across CFIR's five domains.

1. Within Intervention Characteristics (attributes of the LHA itself; 0.3%), procedural complexities highlighted the need for well-defined workflows and contingency planning, underscoring the importance of staff training and workflow optimization through a time-and-motion study.
2. Inner Setting (organizational context and readiness for LHA implementation; 9.6%) revealed inefficiencies such as multitasking, limited staff availability, and equipment malfunctions, despite effective team coordination and escalation protocols.
3. Outer Setting (external influences such as patient needs and socio-cultural factors; 89.4%), patient delays and refusals due to logistical and cultural barriers emphasized the need for patient-centered strategies: aligning study visits with routine healthcare visits minimized disruptions, though logistical hurdles persisted despite telephonic reminders and travel reimbursements.
4. Characteristics of Individuals (participants knowledge, beliefs, and abilities; 0.6%) indicated low engagement and literacy challenges, suggesting visual aids to improve comprehension.
5. Process domain (steps involved in LHA implementation; 0.1%), regular reviews with the study coordinator supported task coordination; however, documentation gaps and overlapping priorities underscored the need for structured management training.

Conclusions/Next steps: Addressing multi-level barriers through tailored strategies, including enhanced patient engagement, structured staff training, and workflow optimization, could improve LHA implementation.

Findings emphasize the importance of aligning implementation strategies with the realities of LMIC public health systems to support LHA delivery.

EP1035

Monitoring the rates of cervical lesions by age and previous screening status among women living with HIV in Eswatini military clinics

V.L. Masuku[1], P.B. Dlamini[2], J.J. Simelane[3], D.Z. Maseko[4]

[1]URC, HIV, Mbabane, Eswatini, [2]URC, Monitoring and Evaluation, Mbabane, Eswatini, [3]UEDF, Military Health, Manzini, Eswatini, [4]UEDF, Health, Manzini, Eswatini

Background: Women living with HIV (WLHIV) are at increased risk for persistent human papilloma virus infection and invasive cervical cancer. Eswatini adopted WHO's guidelines to screen and treat cervical cancer among WLHIV on antiretroviral therapy (ART).

Description: Since November 2019, with Department of Defense HIV/AIDS Prevention Program (DHAPP) funding, URC introduced cervical cancer screening at all 10 Umbutfo Eswatini Defense Force (UEDF) clinics. URC equipped and trained healthcare workers to rapidly scale up annual cervical cancer screening using visual inspection with acetic acid (VIA) for WLHIV aged 25-49 years and pap smear screening for women over 50 years old, aligned with Eswatini screening protocols. URC supported UEDF health staff to line list eligible persons, integrate cervical cancer screening education into ART refill sessions, conduct clinical mentoring, and ethically use cameras for lesion classification in remote facilities. The screenings and outcomes were documented in electronic medical records, with positive cases referred to Ministry of Health treatment sites.

Lessons learned: Between October 2023 and September 2024, with URC's support, a total of 947 screenings were conducted across the 10 UEDF clinics. VIA screenings accounted for 81.3% (770/947), and pap smear screenings accounted for 18.7% (177/947). First-time screenings were at 20.0% (189/947), re-screenings were at 77.8% (737/947), and follow-up screenings after precancerous lesion treatment were at 2.2% (21/947). The overall prevalence of precancerous lesions was 5.1% (48/947), with 2.6% (5/189) among first-time screenings, 5.6% (41/729) among re-screenings, and 10.5% (2/19) among post-treatment follow-up screenings. The majority, 89.6% (43/48), were aged 20-49 years, while 10.4% (5/48) were above 50 years old.

Conclusions/Next steps: Rescreened individuals were 2.2 times more likely to have a precancerous lesion compared to first-time screeners, highlighting the need for enhanced mentoring when initiating cervical cancer screenings at new sites.
Additionally, the recommended 12-month screening interval may be too long for WLHIV, suggesting a need to reduce to shorter screening intervals and adopt innovative approaches to improve first-encounter screening quality, such as using more sensitive stains. The project will continue treating all women who screen positive and linking those with invasive lesions to national referral clinics.

EP1036

Geographic disparities and predictors of positive cervical cancer screening outcomes among women living with HIV in Nigeria: a retrospective analysis

I. Abah[1], G. Ayo-Jatto[1], O. Taiwo[1], O. Ogorry[1], O. Airaoje[1], D. Sulaiman Dauda[2], M. Li[2], C. Laurence[2], P. Gado[3], T. Usha[3], A. Idemudia[3], U. Omo-Emmanuel[3], O. Oyelaran[3], J. Pius[3], E. James[3], D. Ogundehin[3], R. Eneogu[3], M. Katbi[3], C. Obiora-Okafo[3], D. Kimanga[3], B. Adebobola[4], M. Morka[4], T. Ileri[5], F. Agbo[5], F. Jejere[5], R. Agulu[5]
[1]Palladium, Abuja, Nigeria, [2]Palladium, Washington DC, United States, [3]United States Agency for International Development (USAID), Abuja, Nigeria, [4]National AIDS and STI Control Programme (NASCP), Abuja, Nigeria, [5]National Agency for the Control of AIDS (NACA), Abuja, Nigeria

Background: Cervical cancer is the second most common cancer in Nigeria and the second most common cause of cancer deaths among women aged between 15–44 years. According to the World Health Organization (WHO), women living with HIV (WLHIV) are six times more likely to develop the disease.
Fortunately, understanding the predictors of screening positivity can inform targeted interventions to improve early detection and reduce morbidity and mortality in Nigeria.
Methods: A retrospective study analysed de-identified data of 229,502 WLHIV screened for precancerous lesions across 537 facilities in 17 states between January 2019 and September 2024. Logistic regression was used to identify predictors, considering variables such as geographic location, population setting (urban or rural), age, antiretroviral therapy (ART) duration, and screening type (first-time screening, follow-up after previous negative or suspected cancer, or post-treatment follow-up). Positivity rates were expressed per 1,000 WLHIV screened.
Results: Overall, 1.2% (2,858) of WLHIV tested positive for precancerous cervical lesions (median age: 37 years, IQR: 31-42). Positivity was highest among women aged 50-54 years with over twice the odds of screening positive (OR = 2.21, p = 0.005) and in urban settings (18/1,000 vs. 4/1,000 in rural; OR = 1.70, p < 0.001).
Geographic disparities were significant, with Taraba State reporting the highest (111/1,000; OR = 7.6, p < 0.001), followed by Zamfara (39/1,000; OR = 2.7, p < 0.001) and Lagos (23/1,000; OR = 1.5, p < 0.001). The duration of ART was not found to be significantly associated with the likelihood of testing positive for precancerous lesions. (OR = 1.0003, p = 0.3845). Follow-up after a prior positive result had the highest positivity rate compared to other screening types (30/1,000; OR = 1.98, p = 0.009).
Conclusions: Urban settings, prior positive results, age, and certain states such as Taraba, Zamfara, and Lagos were significant predictors for screening positive for cervical cancer.
These findings underscore the need for geographically targeted screening and follow-up programs to optimize early detection. Further research is essential to investigate the role of ART in reducing cervical cancer risk.

EP1037

Identification and prioritization of barriers and ranking of strategies for depression screening in adolescent HIV clinics in Kenya

C. Mugo[1], J. Adhiambo[2]
[1]Kenyatta National Hospital, Medical Research, Nairobi, Kenya, [2]University of Nairobi, Mental health and psychiatry, Nairobi, Kenya

Background: Holistic care for Adolescents and youth living with HIV (AYH) should include screening and care for mental illnesses. However, gaps in implementation of screening exist. We piloted novel methods developed by the University of Washington IMPACT Center (rapid evidence review and barrier prioritization) to identify barriers and strategies to improve depression screening for AYH in Kenya.
Description: Two researchers in Kenya conducted a rapid review of published literature (*PubMed and Web of Science*) on barriers of screening and strategies to enhance screening in HIV care clinics for AYH in developing countries. A 2-day stakeholders' workshop with 11 participants drawn from Nairobi City County health department and HIV care facilities validated the barriers from literature and identified additional barriers. The barriers were prioritized across 6 domains (Likert scores: 0-3), with weighting (0-1) as follows: importance (1), frequency (0.5), duration (0.25), addressability (0.75), timing (0.5) and equity (0). Weighted means were multiplied for final scores. Ranking of strategies to address priority barriers was on impact and feasibility, each on a Likert score of 0-3, with means multiplied for a final score.
Lessons learned: Priority barriers identified were [1] Gaps in provider knowledge on depression screening (mean score: 5.7), [2] Gaps in provider knowledge of mental illnesses (5.2), [3] Stigma of mental illness among youth (4.3), [4] Heavy provider workload (3.7), [5] Complicated referral process (3), and [6] Poor client attitude towards mental health (3). The top ranked strategy to address provider knowledge gaps were: [1] On-job training of providers specifically on depression screening during continuous medical education sessions at facilities (mean score: 6.5), and [2] Formation of multidisciplinary teams where providers review cases of mental illness with a specialist to improve knowledge on mental illnesses (6.9). Using youth support groups was preferred to demystify mental ill-

ness among youth and improve their attitudes towards mental health (6.3). Designated clinic days, and development of county-specific referral protocols were other top-ranked strategies.

Conclusions/Next steps: The stakeholder-led barrier prioritization process informed by a rapid evidence review was acceptable and effective in identifying priority barriers, and the optimal strategies to improve mental health screening implementation outcomes, to be implemented in ongoing programs.

EP1038

Facilitators and barriers to mental health service integration for women with HIV in outpatient care: insights from healthcare providers in Malaysia

A. Kukreja[1,2], A. Salleh[1], K. Hasmukharay[2], J. Ross[3], K. Lovero[4], R. Rajasuriar[1,2]

[1]Universiti Malaya, Centre of Excellence for Research in AIDS (CERIA), Kuala Lumpur, Malaysia, [2]Universiti Malaya, Department of Medicine, Kuala Lumpur, Malaysia, [3]TREAT Asia, amfAR - The Foundation for AIDS Research, Bangkok, Thailand, [4]Columbia University, Department of Psychiatry and New York State Psychiatric Institute, New York, United States

Background: Women with HIV (WWH) face mental health (MH) conditions, impacting antiretroviral adherence and retention in care. In low-and-middle-income settings, integrated HIV-MH services are uncommon, despite evidence of improved outcomes.

This pre-implementation study explored facilitators and barriers amongst healthcare providers (HCPs) to integrating MH services in an HIV clinical centre in Malaysia.

Methods: We conducted N=7 focus group discussions at Universiti Malaya Medical Centre from August 2023–September 2024 with HCPs from Infectious Diseases (ID) and Psychological Medicine (Psy) across various roles: residents (ID=2, Psy=2), specialists (ID=3, Psy=2), consultants (ID=1, Psy=1), psychologists / counselors (ID=3, Psy=2), clinic nurses (ID=2, Psy=2), support staff (ID=3, Psy=2), and nursing heads (ID=2, Psy=1). Using a semi-structured interview guide based on the CFIR2.0, we explored facilitators and barriers to integrating MH screening and linkage to care into outpatient HIV services for WWH. Thematic analysis was conducted in Dedoose.

Results: A total of 28 HCPs (ID=16, Psy=12, 78.5% female) participated, including 26(92.9%) with >5 years of clinical experience. Three themes emerged:

Women-Centered Factors, Mental Health Perceptions and Engagement, and **Organizational Readiness.**

Facilitators included HCPs' recognition of the benefits of integrating MH services within ID clinics and willingness to be trained to co-manage MH by Psychological Medicine. However, barriers included the lack of standardized management algorithms and care pathways, as HCPs expressed a need for a clear framework to guide integration efforts. Additional barriers were staff shortages, space limitations, time constraints, junior clinicians' lack of ownership for MH screening, and feasibility and sustainability of onsite psychiatric services. HCPs also highlighted that patriarchal norms and reserved communication styles among WWH create challenges in addressing MH needs, as they may hinder open discussions and timely intervention. Supporting quotes are presented in the table.

Theme	Quote	Subtheme
Women-Centred Factors	Barrier: "And the women, the ones who are usually a bit more reserved. You know, they're usually the wives of patients already with HIV. So, when they come for the consultation, it's their husbands or relative talking on behalf for them.." (Resident, ID Unit, <5 years experience [exp.])	Patriarchal norms and communication
Mental Health Perceptions & Engagement	Facilitator: "I think that in this particular population, if we were able to integrate the mental health service in ID clinic, would really help them to get easier access." (Specialist, Psychological Medicine, >5 years exp.)	Benefit of Integrated services
	Barrier: "A lot of us do not regard this as our responsibility. What most of us would ask is how do you feel and if patients just brush it off, then we'll just let it go" (Resident, ID Unit, <5 years exp.)	Lack of ownership by clinicians
Organizational Readiness	Facilitator: "We have to be properly trained so that we have the knowledge to communicate with the patients" (ID Clinic Nurse, >5 years exp.)	Willingness to be trained
	Facilitator: "Why don't we train the ID doctors to prescribe? So that is also one of the training module that we plan." (Clinical Psychologist, Psychological Medicine, >5 years exp.)	Training support from Psychological Medicine
	Barrier: "So it would be very, very helpful if we have a structured way of approaching this. And then after that, if the patient has this, what can I do?" (Consultant ID Physician, >5 years exp.)	Lack of standardized tools and care pathways
	Barrier: "So, we'll be short of about 5 staff. So, I think we can't manage more clinic manpower" (Head Nurse, ID Clinic, >5 years exp.) "Now, we only have one clinical psychologist who is leaving and one counsellor. Which is me doing counselling in psych clinic. It's only me." (Counsellor, Psychological Medicine, >5 years exp.)	Human resource constraints
	Barrier: "There are a lot of advantages to having to do that (referring to having an onsite psychiatrist in the ID clinic), but I think the huge question is resource. Do we have enough people? Can we allocate the person to be there on the days you have your ID clinic? I think that's the main barrier" (Specialist, Psychological Medicine >5 years exp.)	Feasibility of onsite Psychiatric services
	Barrier: "From what I see, what happened to the rest of our integrated clinics like obesity, psychogeriatric, it's so hard after a few months. Because the commitment and what the people want to prioritise after that. Yes, initially they are very excited and but after that, it falls apart. (ID Specialist, >5 years exp.)	Sustainability challenges

Conclusions: Insights from HCPs highlight facilitators to leverage, such as willingness to be trained and barriers to overcome, like the lack of standardized frameworks, to implement tailored, integrated MH-HIV services that improve care outcomes for women.

EP1039

Effect of integrating hypertension care into HIV services on healthcare provider burnout and well-being

C.F. Lipoto[1], S. Mwaka[1], A. Katahoire[2], J.B. Kiggundu[1], R. Twine[1], M. Muddu[1], J. Kayima[3,4], G. Mutungi[5], D. Spiegelman[6], J. Schwartz[7,8], M. Abdo[6], I. Ssinabulya[3,4,8], C. Longenecker[9], F.C. Semitala[1,3,10]
[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]Makerere University, Child Health Centre, Department of Medicine, Kampala, Uganda, [3]Makerere University, Medicine, Kampala, Uganda, [4]Uganda Heart Institute, Kampala, Uganda, [5]Ministry of Health, Non Communicable Diseases, Kampala, Uganda, [6]Yale School of Public Health, Biostastics and Center for Methods on Implementation and Prevention Science, Connecticut, United States, [7]Yale School of Medicine, General and Internal Medicine, New Haven, United States, [8]Uganda Initiative for Intergrated Management of Non Communicable Diseases, Kampala, Uganda, [9]University of Washington, Global Health, Seattle, United States, [10]Makerere University Joint AIDS Program, Kampala, Uganda

Background: Burnout, characterized by emotional exhaustion, depersonalization, and diminished personal accomplishment, is a critical concern among healthcare providers (HCPs). While integrating HIV and hypertension services enhances person-centered care and provider satisfaction, it may increase responsibilities, potentially inducing burnout.
This study sought to assess the effect of integrating HIV and hypertension care on burnout and well-being among HIV HCPs in Wakiso and Kampala districts of Uganda.
Methods: A prospective cohort study nested within a stepped wedge cluster randomized trial evaluating two implementation strategies; "BASIC" entailing hypertension training, supply of hypertension medications and blood pressure machines, and the "PLUS" adds, enhanced hypertension training, differentiated service delivery for hypertension and performance feedback. Forty-three HCPs at 16 clinics completed the Copenhagen-Burnout-Inventory and WHO-5 well-being Index surveys at the beginning and six months after the intervention. Burnout was classified as: no burnout (<50%), moderate burnout (50%-74%), high burnout (75%-99%), and severe burnout (100%) while well-being was categorized as; good (≥50%), poor (29%-49%), and possible depression (<28%). We performed a difference-in-difference regression model to estimate intervention effects.
Results: Of 43 HCPs (BASIC-21, PLUS- 22), 56% were female; median age; 34 years [30-41]. At baseline, 5% of HCPs in PLUS and 6% in BASIC had burnout, which increased to 6% and 10%, respectively, after six months. Personal burnout declined from 35%(SD±12) to 31%(SD±17) and 34%(SD±12) to 29%(SD±14) in BASIC and PLUS, respectively.
Work-related burnout declined from 25%(SD±15) to 21%(SD±15) in BASIC and from 25%(SD±14) to 20%(SD±16) in PLUS. Client-related burnout decreased from 20%(SD±18) to 15%(SD±15) in BASIC while scores in PLUS were similar. Well-being increased from 74% (SD± 130) to75%(SD±19) in PLUS but declined from 70%(SD±14) to 67%(SD±18) in BASIC. Difference in difference estimators showed that personal and work-related burnout decreased over 6 months of PLUS implementation; however, the client-related burnout increased (coefficient: 4.4, 95% CI: -13.7,4.8; p=0.3).
Conclusions: Although HCPs in HIV care experienced some levels of burnout, integrating HIV and hypertension services neither potentiated burnout nor reduced HCPs' well-being. Contrary to HCP perceptions, integrating hypertension and HIV care is possible without exacerbating burnout.

EP1040

Using quality improvement to rapidly scale-up TPT among HIV-positive individuals on ART at Eswatini military clinics

P. Okoth[1], J. Simelane[2], V. Masuku[1], T. Lapidos[3], Z. Bhila[1], N. Masina[2], P. Dlamini[1,1], N. Dlamini[1]
[1]URC, Mbabane, Eswatini, [2]Umbutfo Eswatini Defence Force, Military Health Services, Matsapha, Eswatini, [3]Eswatini US Embassy, Department of Defense, Ezulwini, Eswatini

Background: People with HIV are 18 times more likely to develop tuberculosis (TB) than those without HIV infection. Tuberculosis preventive therapy (TPT) reduces TB deaths among HIV-positive individuals by up to 80% and increases survival for people living with HIV (PLHIV). The Eswatini 2018 HIV guidelines and 2019 TB guidelines recommended initiating TPT one month after starting antiretroviral therapy (ART). With Department of Defense HIV/AIDS Prevention Program (DHAPP) funding, URC assisted with the rollout of TPT at all 10 Umbutfo Eswatini Defense Force (UEDF) clinics in 2018, but from July to September 2019, TPT coverage was less than 20% of those eligible at the military clinics.
Description: To address the low TPT coverage, URC supported UEDF health staff to develop quality improvement (QI) projects at all the military clinics from October to December 2019, with a goal to rapidly scale up TPT initiation from 19% to 75% among PLHIV on ART. QI teams conducted a process flow gap analysis to inform interventions.
Tailored approaches were then implemented over a 36-month period, such as enhancing demand through TPT patient literacy and sensitization (with targeted messages for patients completing TB treatment); developing standard operating procedures; creating TPT eligibility patient lists and appointments; training healthcare workers; stocking isoniazid plus pyridoxine; and printing data collection registers and documentation.
Lessons learned: Following the implementation of the QI projects, TPT coverage improved from 19% (416/2,248) from July to September 2019 to 78% (2,787/3,568) from July to September 2022. The TPT completion rate improved from 14% (25/174) from July to September 2019 to 90% (2,384/2,637) from July to September 2022. Results were used to inform the TPT scale-up plan by replicating the strategies across all 10 UEDF sites. Improvements were observed in TPT documentation, stock management, healthcare worker confidence in providing TPT, and team cohesion.

Conclusions/Next steps: Applying QI methodology is effective in rapidly scaling up TPT among HIV-positive individuals, and shorter TPT regimens may further improve coverage. QI approaches develop organizational culture by enhancing member contributions, improving overall health care services, and institutionalizing continuous improvement processes.

EP1041

Client and provider perspectives on interventions for unhealthy alcohol use among people with HIV and TB in Southwestern Uganda

S. Naomi karamagi[1], S. Shangani[2], B. Fisk-Hoffman[3], C. Kyampire[1], E. Kanini[1], K. Lunze[2,3], L. Carlson[3], N. Gnatienko[3], S. Rossi[3,4], S. Tandon[3], B. Staitieh[5], J. Samet[2,3], K. So-Armah[2,3], W. Muyindike[1]

[1]Mbarara University of Science and Technology, MUST Grants Office, Mbarara, Uganda, [2]Boston University, Boston, United States, [3]Boston Medical Center, Boston, United States, [4]University of North Carolina, Chapel Hill, United States, [5]Emory University, Atlanta, United States

Background: Unhealthy alcohol use among people with HIV (PWH) and TB hinders HIV viral suppression and TB treatment success in sub-Saharan Africa. Few studies describe client and provider perspectives on alcohol interventions in PWH and TB. We interviewed PWH in TB treatment and key informants in Mbarara, Uganda to explore their perspectives on current and future alcohol-related interventions at different levels of the socio-ecological model (SEM).

Methods: We conducted in-depth interviews between November 2023 and September 2024 with two groups: 13 PWH in TB treatment with hazardous alcohol use (Alcohol Use Disorders Identification Test (AUDIT) score>8); and 12 providers (including public health officials).

Interviews focused on the availability of existing resources for addressing alcohol use and ideas for other interventions. We coded transcripts using NVivo. Key themes were identified with a codebook thematic approach guided by the SEM.

Results: Clients were 38% female, mean age 38+8 years, 77% at risk of alcohol use disorder (AUDIT score>15); providers were 33% female, 67% with >10 years' experience. Individual level interventions identified included one-on-one counselling - currently available with limited follow-up and only for clients intoxicated at appointments. Pharmacotherapy was not generally available but was believed to be effective, although some expressed concerns about pill burden. At the interpersonal level, family counselling was suggested as a potential intervention, as participants mentioned that family input often influenced alcohol use/cessation.

Participants also indicated an interest in group counselling, which they felt could reduce key motivations for drinking: loneliness and boredom. At the clinic level, participants suggested having dedicated clinic days for providing alcohol interventions. Proposed community-level interventions included more specific public health messaging and outreach activities. At the policy level, participants mentioned a need for better education on alcohol-related harms. Cross-cutting challenges identified included resource limitations, stigma, and other barriers to implementation.

Conclusions: Effective interventions for unhealthy alcohol use among PWH in TB treatment require a multi-level approach. Future research should evaluate integrating alcohol interventions into HIV/TB treatment settings to improve HIV viral suppression and TB treatment success. More research on identifying and reducing barriers to and facilitators for these interventions is needed, with particular emphasis on sustainability.

EP1042

Integrating HIV and NCD care through one-stop clinics: a holistic approach to strengthening primary healthcare in Uganda

E. Nambala[1], I. Mirembe[2], M. Odot[3], A. Ocero[4], A. Muhwezi[4], R. Iriso[4], E. Bitarakwate[5], K. Baleeta[6], A. Komukama[7], B. Turesson[8], D. Jacobson[8], M. Laverentz[8], J. McGaugh[8], J. Nabwire[9], S. Walwo[10], S. Obbo[10]

[1]URC,USAID Uganda Health Activity, Quality Improvement, Mbale, Uganda, [2]URC,USAID Uganda Health Activity, Knowledge Management and Communication, Mbale, Uganda, [3]FHI360,USAID Uganda Health Activity, Technical, Mbale, Uganda, [4]URC,USAID Uganda Health Activity, Kampala, Uganda, [5]EGPAF,USAID Uganda Health Activity, Kampala, Uganda, [6]URC,USAID Uganda Health Activity, Technical, Kampala, Uganda, [7]URC,USAID Uganda Health Activity, Knowledge Management and Communication, Kampala, Uganda, [8]University Research Co; LLC, Technical, Washington, United States, [9]URC,USAID Uganda Health Activity, Quality Improvement, Kampala, Uganda, [10]Mbale Regional Referral Hospital, Technical, Mbale, Uganda

Background: In Uganda, HIV care is primarily delivered through standalone antiretroviral therapy (ART) clinics, which also manage non-communicable diseases (NCDs). However, HIV-negative clients with NCDs depend on chronic care clinics, which have limited coverage outside higher-level facilities. As Uganda approaches HIV epidemic control, integrating HIV care with NCD management into primary healthcare has become a strategic priority. This project explored the impact of a one-stop integrated clinic model on health outcomes.

Description: The USAID Uganda Health Activity (UHA), in partnership with the Ministry of Health, piloted an integrated care model at three facilities including two lower-level health facilities i.e. a Health Centre III (Bunapongo), a Health Centre IV (Bufumbo), and a tertiary level health facility i.e. Mbale Regional Referral Hospital (RRH). Stakeholder engagement at facility, district, and regional levels ensured alignment and support. Each site developed inclusion criteria for people living with HIV (PLHIV) and NCD clients. The model used improvised data tools, including client care cards and counter books, to streamline care delivery. Biweekly virtual meetings supported knowledge-sharing and problem-solving across the sites from June to December 2024.

Lessons learned: The integrated model achieved high client satisfaction, with 95% (359/378) of clients reporting satisfaction through a standardized survey. Enrolment of PLHIV increased significantly: at the RRH, from 6.4% (341/5,342) in June 2024 to 15% (789/5,342) in December 2024; at Bunapongo, from 10% to 14% (35/251); and at Bufumbo, from 35% to 60% (292/489).
Among NCD clients, 80% (832/1,039) achieved good clinical outcomes, while viral suppression rates among PLHIV improved from 94% in June to 95% (607/628) in December 2024. Follow-up appointment adherence increased from 89% (357/399) in September 2024 to 93% (512/549) in December 2024.
Conclusions/Next steps: Integrating HIV and NCD care into a one-stop integrated clinic model improved health outcomes, client satisfaction, and service delivery. The approach underscores the importance of leadership support, stakeholder engagement, and collaborative learning. Scaling up this model could strengthen primary healthcare, enhance client-centred care, and accelerate progress towards sustainable HIV epidemic control in Uganda.

EP1043

Comparing Tuberculosis (TB) yields among contacts of persons with TB versus contacts of persons living with HIV and TB in Nigeria: which group exhibits a higher TB yield

O. Nissi[1], A. Josiah[2], Q. Effiong[1], J. Onwubunta[2], O. Chukwuogo[3], B. Odume[4], B. Akpan[5]
[1]KNCV Nigeria, Programs, Uyo, Nigeria, [2]KNCV Nigeria, Monitoring & Evaluation, Uyo, Nigeria, [3]KNCV Nigeria, Programs, Abuja, Nigeria, [4]KNCV Nigeria, Management, Abuja, Nigeria, [5]Akwa Ibom State Tuberculosis Control Program, Ministry of Health, Programs, Uyo, Nigeria

Background: TB a leading cause of death and morbidity globally, with persons living with HIV (PLHIV) at higher risk of developing TB disease due to associated immunosuppression. Household contacts of index persons with TB have higher exposure risk, and the presence of HIV might complicate the risk profile.
This study assessed the TB yield among household contacts of Persons with TB versus contacts of persons living with HIV and TB (PLHIV/TB).
Methods: A retrospective cross-sectional study conducted among household contacts of persons with Pulmonary TB was categorized into two groups based on the HIV status of the index person with TB. One group was contacts of persons with TB, and the other included contacts of PLHIV/TB. Between January and December 2024, a total of 4,975 contacts were screened using symptoms-based questionnaires: 3,265 being contacts of persons with TB and 1,710 contacts of PLHIV/TB. Those identified as presumptive TB cases were investigated for TB.
Results: Among the contacts of PLHIV/TB, the TB yield was 23%. In comparison, contacts of persons with TB had a higher TB yield of 32%, with a p-value<0.05. Observing the proportion of presumptive cases, persons with TB group had a higher percentage of 33%, compared to 23% in PLHIV/TB group. Furthermore, the proportion of children aged 0-14 years diagnosed with TB was remarkably higher in persons with TB group, at 34%, compared to 12% in PLHIV/TB group.

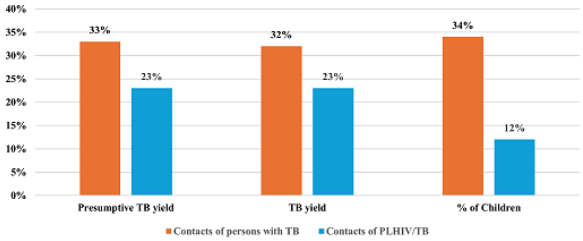


Figure. Comparison of TB indicators of contacts of persons with TB & PLHIV/TB.

Conclusions: Contacts of persons with TB are more likely to be diagnosed with TB disease compared to contacts of PLHIV/TB. HIV appears to lessen the likelihood of TB transmission. The high TB yields observed in both groups underscores the importance of TB screening of the contacts of index persons with TB. This is essential for identifying persons with TB disease who require treatment and for implementing TB Preventive Therapy to tackle latent TB infections.

EP1044

Alignment of end-to-end HIV services by Global Fund, PEPFAR & Government of Nigeria in Northern, Nigeria: lessons learnt & impact on HIV service continuity

C. Odima[1], J. Ashivor[1], H. Mohammed[1], J. Anyanti[1], K. Eruchalu[1], K. Ukueku[1], O. Farinu[1], S. Makka[1], Q. Akewusola[1], J. Ojo[1], O. Omede[1], M. Yalwe[1], R. Obilor[1], O. Adebayo[2], B. Pillatar[2], H. Raji[2], U. Ugwoke[2], E. Vincent[2], A. Adekunle[2], O. Opeyemi[2], O. Isaac[2], A. Saleem[3], D. Mohammed[4], M. Zamsu[5], N. Workneh[5], J. Kimeu[5], O. Idogho[1]
[1]Society for Family Health, Program Management - HIV Division, Abuja, Nigeria, [2]Institute of Human Virology, Nigeria, HIV, Abuja, Nigeria, [3]Kwara State Agency for the Control of AIDS (KWASACA), HIV, Ilorin, Nigeria, [4]Gombe State Agency for the COntrol of AIDS (GOMSACA), HIV, Gombe, Nigeria, [5]The Global Fund to Fight AIDS, Tuberculosis and Malaria, HIV, Geneva, Switzerland

Background: The alignment of HIV services between the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and the Global Fund (GF) became essential for continuity, scalability, and long-term sustainability in HIV programming in Kwara and Gombe states, Nigeria. The transition of General population and Orphans and Vulnerable children (OVC) programs were structured to maintain service quality while shifting ART client management from PEPFAR and the GF. These states were chosen due to their high HIV burden and progress under PEPFAR-supported projects. The GF 2023 annual report highlighted its investment in HIV treatment, with 25 million people on lifesaving antiretroviral therapy, up from 17.5 million in 2017. By transitioning PEPFAR-supported sites, Nigeria aims to achieve its 95-95-95 targets, aligning with UNAIDS' strategy to end AIDS by 2030.

Description: The transition process in Kwara and Gombe was executed in four structured phases and roadmap: transition planning, pre-transition (data/resource sharing and stakeholder engagement), overlap (joint service delivery with continuous oversight), and post-transition (sustaining service quality).
This phased approach ensured seamless integration of services, minimized disruptions, and maintained compliance with national standards.
Lessons learned: The transition period was January-June 2024. 54 HIV comprehensive health facilities in Gombe (34) and Kwara (20) were transitioned from PEPFAR to GF ensuring uninterrupted service delivery to clients. 38,946 individuals receiving ART for the General population (0-14yrs=2.6% and 15-.50yrs=97.4%) and 20,165 Orphans and Vulnerable Children were transitioned from PEPFAR to GF support. The process demonstrated strong collaborative efforts, real-time data tracking, and technical support were critical in overcoming challenges such as logistics in rural areas and staff turnover.
These efforts underscore the importance of capacity building and structured approaches for health program transition and demonstrates SFH's operational expertise and strengthened Nigeria's capacity to sustain HIV programs domestically.
Conclusions/Next steps: This transition offers valuable lessons for future programming in Nigeria, emphasizing resilience, scalability, and community engagement as the country strives toward its national HIV goals and a replicable framework for similar transitions globally. There is need for enhanced local capacity building, strengthened data systems, broader community involvement. Digital health innovations and integrated, client-centered approaches are vital for sustainable epidemic control.

EP1045

Integration of non-communicable disease (NCD) management into ART service delivery in Niger state: lessons, challenges, and opportunities

D. Sambe[1], A. Etsetowaghan[2], I. Saliu[2], A. Olutola[2], O. Winifred[1], S. Sule[2], A. Bashorun[3], P. Gado[4], T. Leri[5], J. Pius[4], C. Obiora-Okafo[4], E. Atuma[6]
[1]Jhpiego Nigeria, Monitoring and Evaluation, Abuja, Nigeria, [2]Centre for Clinical Care and Clinical Research (CCCRN), Abuja, Nigeria, [3]National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, Abuja, Nigeria, [4]Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, Abuja, Nigeria, [5]National Agency for the Control of AIDS (NACA), Abuja, Nigeria, Abuja, Nigeria, [6]Jhpiego Nigeria, Abuja, Nigeria

Background: The rising prevalence of non-communicable diseases (NCDs) among people living with HIV (PLHIV) presents a substantial challenge for healthcare systems, particularly in low-resource settings. In response, the Centre for Clinical and Clinical Research ACE 4 project in Niger State, the USAID funded Accelerating Control of HIV Epidemic, (ACE 4) integrated NCD management into antiretroviral therapy (ART) services to address this dual burden and improve client health outcomes. This study evaluates the impact of this integration, aiming to identify best practices for health system strengthening.
Methods: Quantitative data were gathered from 20 healthcare facilities across 24 LGAs supported by the ACE 4 project, spanning from January 2023 to December 2024. The facilities were divided into two groups of intervention and control facilities. The intervention facilities received tailored training, on-site mentorship to improve NCD screening, diagnosis and management while the control facilities continued with routine care. The Key indicators includes the proportion of PLHIV screened for NCDs, the prevalence of diagnosed NCDs, treatment initiation rates, and adherence to both ART and NCD medications. Data were extracted from facility records in the Electronic Medical Record (EMR) and analyzed using descriptive and inferential statistics to examine trends and correlations.
Results: Findings revealed that out 2,500 PLHIV 2,175 (87%) were screened for NCDs, with a 45% prevalence of diagnosed NCDs, primarily hypertension (30%). In comparison, only 15% were screened in control facilities, with a 28% NCD prevalence. In the integrated care group, 80% initiated treatment for both HIV and NCDs, compared to 55% in the control group. ART adherence was 92% in the integrated care group versus. 75% in controls, while NCD medication adherence was 85% versus. 60%. Strong correlations (r = 0.72 and r = 0.68 respectively) were found between integration and improved outcomes.
Conclusions: The data strongly support the significance of integrating NCD management into HIV ART services. The results demonstrate that this integration leads to improved screening, higher treatment initiation rates, and better adherence to both ART and NCD medications.
These improvements in care outcomes emphasize the need to prioritize integrated care models in HIV services, which can ultimately enhance the health and well-being of PLHIV.

EP1046

Using non-communicable diseases' champions to improve screening and management in HIV settings between January and September 2024: lessons learnt from Baylor Fort Portal-Mubende Program

D. Damba[1], M. Juma[1], R. K. Jjuuko[1], A. Maganda[1], A. M. Mubiru[2], J. Businge[2], P. M. Namukanja[2], D. Kiragga[1]
[1]Baylor College of Medicine Children's Foundation, Kampala, Uganda, [2]Division of Global HIV & TB, US Centers for Disease Control and Prevention, Kampala, Uganda

Background: In pursuit of the UNAIDS 95-95-95 targets, there is increased need to integrate non-communicable diseases (NCD) care into HIV programming due to the growing dual burden of NCD and HIV epidemics which may compromise ART/HIV treatment outcomes. NCD-HIV integration faces implementation barriers in public health facilities in resource limited settings. We present best practices and lessons from Fort Portal-Mubende HIV program in midwestern Uganda.

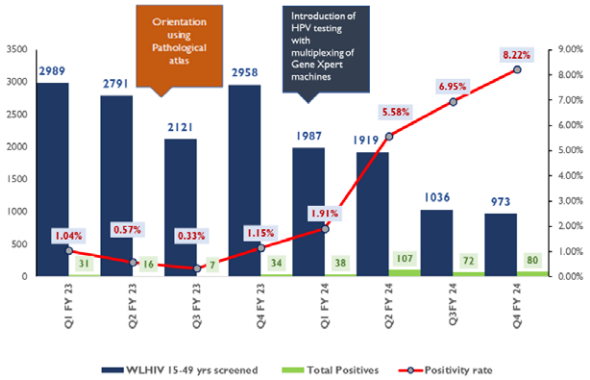
Description: BFU started implementing an integrated HIV/NCD care program in 254 health facilities in 16 districts in mid-western Uganda in January 2024. Interventions include stakeholder engagement meetings, provision of appropriate clinical instruments, job aides, data tools, and mentorship on screening, diagnosis and case management of diabetes mellitus (DM), hypertension (HT), mental health (MH) and alcohol/substance (A/S) abuse.
Biweekly data review meetings were conducted; NCD champions and community structures were identified and engaged to provide adherence support, return missing clients, conduct health education, counseling, and community sensitization of high-risk individuals.
PEPFAR databases were reviewed and the proportions of Persons Living with HIV (PLHIV) ≥ 15 years screened for NCD, diagnosed and treated between Jan-Mar 2024 and Jul-Sep 2024 were compared.
Lessons learned: Between January - March 2024 and July - September 2024, there was an overall increase in PLHIV screened for NCD conditions; from 56% (56178/100842) to 80% overall (71975/90318); DM increased from 49% (48984/100842) to 81% (73608/90318), HTN from 49% (46343/94724) to 82% (73524/90318), MH from 63% (62302/99414) to 79% (71296/90318), A/S from 63% (62302/99414) to 77% (69473/90318).
This was accompanied by a 72% increase in NCD cases identified from 3,159 to 5,443; HTN (1163 to 2942) and A/S (826 to1430) had the highest increase compared to DM (376 to 396) and MH (794 to 675). The proportion of NCD cases treated or referred for management increased from 77% (2442/3159) to 93% (5070/5443). By the end of Sept 2024, 51% of cases were controlled on treatment. NCD champions played a role in demand creation, linkages, and peer support.
Conclusions/Next steps: Engagement of NCD champions improved NCD screening and management of PLHIV. Scale-up by other HIV care providers may improve NCD screening, treatment and ART outcomes.

EP1047

Advancing cervical cancer detection: a scalable HPV testing approach for women living with HIV in the Acholi region

M. Tibyasa[1], I. Kyobutungi[1], R. Onek[1], R. Obura[1], N. Kasunumba[1], D. Kagimu[1], O. Apok[1], A. Angwech[1], A. Lawino[1]
[1]*The AIDS Support Organisation (TASO), Gulu, Uganda*

Background: Cervical cancer constitutes 35.5% of all cancer cases in Uganda, representing the most prevalent cancer among women living with HIV (WLHIV) aged 25-49. Effective early detection methods, including visual inspection with acetic acid (VIA) and Human Papillomavirus (HPV) testing, are crucial for identifying precancerous lesions, which can be effectively treated through thermocoagulation.
However, by the end of 2022, the detection rate for cervical cancer at PEPFAR-supported sites in the Acholi region was alarmingly low, below 1%, failing to meet the Ministry of Health's (MOH) target of 5%. The initial screening approach, relying solely on VIA, was heavily dependent on the subjective assessments of healthcare professionals.
Description: To address this challenge, trained healthcare professionals provided mentorship to site teams, focusing on utilizing pathological atlases to enhance the visualization and identification of common cervical lesions encountered in clinical settings. In partnership with the MOH, the PEPFAR-supported initiative expanded HPV screening to 11 Gene Xpert sites, aiming to improve the detection rate of precancerous lesions among WLHIV. Key actions included strengthening healthcare worker competencies, utilizing Gene Xpert machines for multiplex testing, distributing HPV cartridges, and promoting self-sample collection techniques. These initiatives were designed to boost the uptake of cervical screening among WLHIV.
Lessons learned: Significant improvements were observed in the diagnosis of precancerous lesions: the percentage of women diagnosed through cervical cancer screening increased from 1.04% (31 out of 2,989) at the end of 2022 to 8.22% (80 out of 973) by the end of 2024. Among the 297 positive diagnoses in 2024, 31 were suspected cases of cancer. Of the 266 individuals eligible for treatment, 246 (92%) were successfully linked to care services.



Conclusions/Next steps: The implementation of HPV testing markedly increased the detection rate of precancerous lesions among WLHIV. Furthermore, the introduction of self-sample collection methods significantly enhanced client acceptance and accessibility to screening services.

EP1048

CLM data reflect high quality TB services provided in 20 Health facilities in Maseru District

M. Santi[1], T. Mokholela[1], M. Mokitimi[1]
[1]*Mosepele Foundation Development Forum, Programs, Maseru, Lesotho*

Background: This abstract provides an in-depth secondary analysis of the feedback gathered from individuals who accessed Tuberculosis (TB) services through the Community-Led Monitoring (CLM) initiative in the Fiscal Year 2024. The CLM program, implemented by the Mosepele Foundation Development Forum (MFDF), aimed to collect and analyze patient feedback to improve the quality and

accessibility of healthcare services across various health facilities. A total of 2,150 participants were reached across 20 health facilities in the second round. Of these, 146 individuals received TB services of which 90% were co-infected with HIV, making their feedback crucial for evaluating the overall quality of TB care provided as Lesotho is among 30 priority countries highly burdened by TB.

Methods: The secondary analysis of CLM program data for FY 24 was undertaken to explore the feedback provided by patients who accessed TB services from the 20 supported health facilities in Maseru District. The data was captured manually and analyzed using descriptive statistics.

Results: The findings highlight several critical themes in TB service delivery with notable high quality of services and high patients satisfaction. The feedback shows high accessibility of TB services, with 91% of participants reporting that services were easy to access and 97% reporting that services were readily accessible. 98% of participants reported receiving all the services they were looking for while 97% of participants finding the facilities easy to navigate with 92% expressing satisfaction with the respectful treatment they received from healthcare workers. on the other hand, some respondents reported long distances to health facilities with lack funds for transportation which results in lost followup with fear of returning due to unbecoming attitude of healthcare workers following break from treatment. (28%) described the waiting times as long, and 10% reported them as excessively long cues.

Conclusions: In conclusion, the feedback gathered through the CLM initiative provides valuable insights into the experiences of TB patients and highlights both strengths and areas for improvement in TB service delivery. The findings suggest that while most patients are satisfied with their care, there are ongoing challenges related to access, service availability, waiting times, and confidentiality that require attention.

EP1049

Closing the gaps - integrating HIV testing into TB programs: a scalable model for maternal and pediatric health in Nigeria

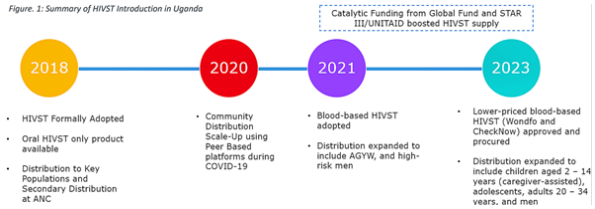
R. Aimu[1], H. Bello Raji[1], O. Adebayo[1], M. Bathnna[2], C. Oga-Omenka[3], E. Kwasi Armah-Ansah[3], E. Vincent[1], J. Daniel[1], U. Ugwoke[1], T. Adetiba[1], A. Adekunle[1], C. Ochigbo[1], B. Pillatar[1], K. Ugwanyi[1], C. Ufoegbu[1], J. Gowon[1], R. Dickson-Nze[1], F. Murtala-Ibrahim[1], E. Okpokoro[2], O. Olupitan[1], A. Agbaje[4], C. Mensah[4], P. Dakum[4], N. Workneh[5], J. Kimeu[5], K. Tsujii[5], M. Zamzu[5], J.-. Nouboussi[5]

[1]Institute of Human Virology Nigeria (IHVN), Program Coordinating Unit (PCU), GF-NTHRIP, Abuja, Nigeria, [2]Institute of Human Virology, Nigeria IHVN, International Research Centre of Excellence, Abuja, Nigeria, [3]School of Public Health Sciences, University of Waterloo, Waterloo, Canada, [4]Institute of Human Virology Nigeria (IHVN), Office of the CEO, Abuja, Nigeria, [5]The Global Fund to Fight AIDS, Tuberculosis and Malaria, Global Health Campus, Geneva, Switzerland

Background: Nigeria accounts for 14% of global pediatric HIV cases, with a 23.4% vertical transmission rate in 2023, driven by low antenatal care coverage and poor PMTCT uptake. Additionally, 62% of deliveries occur outside formal health facilities, often without skilled care. To address these gaps, the IHVN Global Fund Grant cycle-7 implements community-based testing and referral systems as part of TB/HIV integration efforts.

This study evaluates the effectiveness of these interventions in reducing pediatric HIV incidence through community engagement.

Description: In 2023, Uganda introduced two lower-priced BB HIVST kits, Wondfo ($1 EXW) and CheckNow ($1.50 EXW). In 2020, only 3% of all HIV tests distributed in Uganda were HIVST. By 2023, distribution increased over four-fold, representing 12% of all rapid HIV tests. This expansion enabled the introduction of more HIVST distribution channels (Figure. 1)



Lessons learned: Between January and November 2024, the program identified 278,592 PW, testing 219,093 (79%) for HIV. Of these, 1,098 (0.5%) tested positive and were linked to care and ANC. Additional cases included 553 syphilis, 53 hepatitis B, and 13 HIV-HBV co-morbidity. Compared to 2023, the project accounted for 14% of newly identified HIV-positive PW and an 8% increase in PW aware of their HIV status

Key successes include strengthened TB-HIV collaboration, improved ANC attendance, and local ownership. Best practices include integrated disease testing and expanded logistics delivery points. While Challenges include TB-worker resistance, dual test kit shortages, and limited commodity access.

Conclusions/Next steps: The findings highlight the effectiveness of integrating HIV testing into TB programs and leveraging community-based interventions to enhance HIV prevention, treatment, and ANC attendance, while identifying co-mobidities and addressing gaps in service delivery, offering a scalable model for improving maternal health outcomes and reducing pediatric HIV incidence.

EP1050

Integration of the active case finding tool to enhance tuberculosis screening and diagnosis among healthcare seekers: a case of Othoro Level 4 Hospital, Kenya

V. Nyanoti[1], J. Kwatampora[2], G. Mosima[3], V. Adwar[4], S. Kinyanjui[2]
[1]AIDS Healthcare Foundation, Kisumu, Kenya, [2]AIDS Healthcare Foundation, Nairobi, Kenya, [3]Ministry of Health, Kisumu, Kenya, [4]Ngima Mogen, Kisumu, Kenya

Background: The global pursuit of identifying and eradicating tuberculosis (TB) remains a challenge, but with effective mechanisms and interventions this goal is achievable. Othoro hospital (OH) is in Homa Bay (HB) County in Kenya and HB is among the top five counties with a high burden of TB and HIV. OH, had a low identification of TB diagnoses at 14% as at August 2022. To curb this, TB screening was introduced at all service delivery points using the Active Case Finding Tool (ACFT). This was meant to compliment screenings that was previously done at the HIV clinic only. The study aims to assess the impact of the ACFT.
Description: We reviewed healthcare seekers registers for the period October 2022 to October 2023 and assessed the number of clients screened using the ACFT, those further investigated through chest X-ray, Gene-Expert, TB LAM, and sputum microscopy. Health workers were trained on the use of the active case finding tool and proper documentation, across the service delivery points to decentralize TB screening. Coughing and sick people were given priority and escorted to see the clinician.
Lessons learned: A total of 8,273 females and 5,511 males were screened with the ACFT yielding a presumption rate of 2.8%, out of which 382 samples were tested and 45 TB diagnoses were confirmed. 38 % and 22% of the TB diagnoses were male and female adults living with HIV, while 14% and 18% were male and female adults who had not acquired HIV.
8% were children below 15years. The positive detection rates were 52% Gene-Xpert, 24% TB- LAM, 19% sputum microscopy, and 5.2% Chest X-ray. The TB case identification increased from 14% to 84% one-year post implementation of the study.
Conclusions/Next steps: This study demonstrated an increased number of TB diagnoses by decentralizing TB screening from the HIV clinic and integrating screening across all service delivery points. Adapting the ACTF integration will reduce the TB stigma and its association with HIV.

EP1051

Cancer prevention: knowledge, attitudes, and practices of people living with HIV in Argentina

C. Serrao[1], V. Zalazar[1], E. Frontini[1], G. Devisich[1], M.C. Trejo[1], N. Cardozo[1,2,3], M. Duarte[1,3], S. Fabian[1,4], M. Sandoval[1], M.E. Esandi[1], M.I. Figueroa[1], I. Aristegui[1], V. Fink[1]
[1]Fundacion Huesped, Research Department, Buenos Aires, Argentina, [2]REDLACTRANS, Buenos Aires, Argentina, [3]Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.T.A.), Buenos Aires, Argentina, [4]Asociación Civil Gondolin, Buenos Aires, Argentina

Background: Antiretroviral therapy has extended the life expectancy of people living with HIV (PLHIV), leading to an aging population and a rising incidence of non-AIDS-defining cancers. This study examined knowledge, attitudes, and practices concerning cancer prevention among PLHIV in Buenos Aires, Argentina.
Methods: A focus group (FG) was conducted in November 2024, with 13 PLHIV: 4 men who have sex with men (MSM), 6 transgender women (TGW), and 3 cisgender women (CW). Participants provided informed consent. The 90-minute FG was transcribed and analyzed using Hamilton's rapid analysis. Predefined categories were used: knowledge (prevention, screening, risk factors, and information sources), attitudes and beliefs, practices (behaviors and barriers), and recommendations.
Results: Participants reported limited knowledge of cancer risk factors and screening but lacked knowledge of the recommended age for screening and the implications of familial cancer burden.
Key sources of information included their infectious disease specialists (IDS), Google, and artificial intelligence tools. Younger MSM, who were more knowledgeable, emphasized the need for accessible and reliable information, referencing science communicators as key facilitators. Some participants noted a significant gap in cancer awareness beyond breast cancer, highlighting the need for broader visibility and education efforts in cancer prevention.
Others mentioned that it is beneficial to adopt healthy habits for a good quality of life, but they did not believe it was directly related to cancer prevention. A myth emerged, especially in TGW, suggesting that avoiding thoughts of illnesses could prevent them from developing.
Barriers included limited appointment availability, long waiting times and difficulties building trust with non-IDS providers for sensitive discussions and exams, particularly proctological. Other barriers were: socioeconomic vulnerability, fear of diagnoses other than HIV, stigma and discrimination related to HIV and gender identity, and taboos around proctological health.
Conclusions: Significant knowledge gaps and persistent myths about cancer prevention were observed. These, along with structural and individual-related barriers to healthcare highlight the urgency to enhance health information, address misinformation, and foster stigma-free healthcare environments. Targeted awareness campaigns on non-gynecological cancers and improved access to preventive care are critical for enhancing PLHIV´s overall quality of life.

EP1052

Community-based SRHR services for women living with HIV and sex workers in crisis settings

H.T. Win[1], S. Aye[2], L. Pak[3]
[1]Myanmar Positive Women Network, Yangon, Myanmar, [2]Nway Htwe Eain, Yangon, Myanmar, [3]Medecins du Monde - France, Paris, France

Background: Accessing healthcare in Myanmar presents challenges due to high costs, limited resources, and barriers and Martial Law disproportionately affecting women living with HIV (WLHIV) and sex workers. SRHR knowledge remains low, with cervical cancer receiving little attention despite nearly 7,000 new cases and 4,500 deaths annually. In 2023, Nway Htwe Eain (NHE) and Myanmar Positive Women Network (MPWN), in collaboration with Médecins du Monde, launched a SRHR project in Yangon, focusing on cervical cancer prevention through community-based HPV DNA self-sampling.

Description: The project integrated SRHR services, including HIV, STIs, contraception, and cervical cancer prevention, supported by peer-developed IEC materials. Trained peers from NHE, MPWN, and three local partners organized 2,631 individual counseling sessions and 671 collective health education sessions, reaching 9,695 individuals and multiplier training within the communities by the peers, ensuring broader reach.

A total of 1,350 WLHIV and sex workers were tested for HPV DNA, with over 60% opting for self-sampling. HPV testing, more sensitive than VIA, identified 22% as positive, diagnosing and treating 77% of cases VIA might have missed. Among those treated, 95.5% received care for high-risk HPV types.

Lessons learned: NHE and MPWN adapted to Myanmar's restrictive environment by prioritizing individualized counseling and tailored support, fostering behavior change and invested in peers capacity building. Engaging key stakeholders, such as family members, bar managers, and brothel owners, enhanced women's access to services.

Awareness sessions, paired with peer training and counseling, not only increased prevention uptake but also empowered women to take an active role in cervical cancer prevention. The self-sampling approach increased healthcare access, and proved particularly effective in restrictive settings.

Conclusions/Next steps: This project demonstrates that SRHR services, including cervical cancer prevention, can be successfully implemented in crisis settings through community-driven approaches. Integrating self-sampling HPV testing with comprehensive SRHR services and equipping peers from local organizations addressed the unique needs of WLHIV and sex workers.

Scaling up such initiatives can reduce cervical cancer morbidity and mortality while addressing broader SRHR needs, extending beyond HIV prevention to comprehensive harm reduction intervention.

EP1053

Innovations in HIV service delivery: lessons from Zimbabwe's differentiated service delivery review

T. Apollo[1], C. Gwanzura[1], C. Mupanguri[1], E. Govha[1], T. Matare[1]
[1]Ministry of Health and Child Care, HIV, Harare, Zimbabwe

Background: Differentiated Service Delivery (DSD) is a client-centered approach optimizing HIV services to align with client preferences and health system efficiencies. Zimbabwe began implementing DSD models for antiretroviral therapy (ART) in 2017 and has conducted annual DSD Reviews since 2018. These reviews evaluate progress, share best practices, address challenges, and highlight innovations.

The 2024 DSD Review, held in July-August 2024, marked a critical milestone by incorporating four provinces—three participating for the first time—and expanding focus to include service integration with tuberculosis (TB), family planning (FP), mental health, and non-communicable diseases (NCDs).

Description: The review included 148 facilities across 30 districts in Mashonaland East, Masvingo, Matabeleland North, and Midlands. Data collection involved facility and individual client surveys, analyzing 4,630 recipient of care (RoC) records across 12-, 24-, and 36-month ART cohorts. Key indicators assessed included viral load monitoring, retention in care, integration of services, and uptake of DSD models. Data were collected using Survey CTO and analyzed with Power BI. The review methodology emphasized triangulation with national data, ensuring robust findings.

Lessons learned: Key findings revealed both progress and gaps. Over 80% of recipients of care (RoCs) initiated ART on the same day as HIV confirmation, while multi-month dispensing (MMD) reduced facility visits. Retention rates were below 60%, with under 15% enrolled in DSD models despite eligibility. Over 60% received TB preventive therapy (TPT), and ART-FP service linkages improved. Resource shortages hindered mental health screenings and CD4 testing.

Quality improvement (QI) projects, task-shifting to lay cadres, and tele-counseling pilots addressed documentation challenges and improved continuity. Integrating non-HIV services into DSD models and synchronizing ART with NCD reviews demonstrated scalable approaches to improving care delivery.

Conclusions/Next steps: The DSD Review highlighted the need for better service integration, strengthened cohort management, and capacity-building for healthcare workers to optimize DSD implementation. Scaling electronic health records and addressing resource constraints remain pivotal. Lessons from the review emphasize pathways to sustainable, scalable HIV service delivery in resource-limited settings, reinforcing Zimbabwe's commitment to achieving universal health coverage and UNAIDS 95-95-95 targets. Future reviews will prioritize continuous quality improvement and innovative approaches to close existing gaps.

EP1054

Lessons on integration of NCDs into HIV care and prevalence of non-communicable diseases among people living with HIV in ART clinics managed by the Ugandan military

H. Musinguzi[1], L. Gahurra[1], T. Rwegyema[1], B. Lutimba[1], M. Ssemmanda Kyambadde[1], D. Bwayo[1], M. Kiyuba[2]
[1]URC, Kampala, Uganda, [2]Uganda People's Defense Forces, Directorate of HIV, Kampala, Uganda

Background: As People Living with HIV (PLHIV) live longer because of successful ART programs, non-communicable diseases (NCDs) have now become the leading cause of morbidity and mortality among PLHIV. Over the last 5 years, the military ART program has registered a notable increase in number of elderly clients (≥50yrs) on ART. A study conducted in Uganda among PLHIV on ART revealed that the prevalence of HTN was 29%. In 2023, URC supported the military to integrate NCDs screening and management in HIV clinics. URC trained health workers, provided job aids and onsite mentorship.
This review sought to document lessons on NCD integration, the burden of HTN, DM among adult PLHIV receiving ART from military HIV clinics in Uganda.
Description: This was a program review using routine program data collected over a 3-month period (July to September 2024) for adult PLHIV (≥15yrs) attending 31 ART military facilities. Data were summarized, collated, analyzed using excel, presented as frequencies, percentages, and text.
Lessons learned: By the end of September 2024, 31 military facilities were screening PLHIV for NCDs. Overall, 91% (19,318/21,249) of all adult clients on ART were screened for HTN of whom 2% (452) were diagnosed with HTN. Of those diagnosed with HTN, 53% (240/452) were males, 22% (101/452) were aged 50- 54 years, 18% were 45-49 years, 16% were 40-44years.
Only 4% (19/452) of those with HTN were aged 60+ years. 90% (19,120/21,249) of all adult PLHIV were screened for diabetes mellitus (DM) of whom 0.6% (106) were diagnosed with DM.
Of those diagnosed with DM, 53% (56) were males, 23% (24) were aged 35-39 years. The majority of those found with DM/HTN were unaware of their diagnosis. All PLHIV received the due treatment/referral.
Conclusions/Next steps: NCD screening and management can be easily integrated into HIV Clinics. NCDs, especially HTN are common among PLHIV in Uganda. The highest burden is among men aged 50-54 years. Systematic management of NCDs should be integrated into HIV care programs in sub-Saharan Africa. This will result in early diagnosis, treatment and potentially improved outcomes.

EP1055

Integrating hypertension screening into decentralized antiretroviral refill service delivery points: lessons learnt from Southern Nigeria

S. Usang[1], O. Onwah[1], E. Nwanja[1], E. Ezieke[1], U. Akpan[1], O. Toyo[1], J. Anenih[2], D. Ogundehin[3], R. Eneogu[3], U. Omo-Emmanuel[3], M. Katbi[3], D. Kimanga[3], C. Obiora-Okafo[3], A. Idemudia[3], E. James[3], J. Pius[3], O. Oyelaran[3], O. Onyedinachi[1], A. Adegboye[1], A. Eyo[1]
[1]Excellence Community Education Welfare Scheme, Uyo, Nigeria, [2]National Agency for the Control of AIDS, Abuja, Nigeria, [3]Office of HIV and TB, United States Agency for International Development, Abuja, Nigeria

Background: Access to screening for non-communicable diseases at decentralized antiretroviral refill (DSD) points is important to the delivery of optimal person-centered services for people living with HIV (PLHIV). We document lessons learnt from the integration of hypertension screening into DSD points in Southern Nigeria.
Description: PEPFAR/USAID supports 96 Community Pharmacies and 250 Decentralized Spoke health facilities for ART refill in Akwa Ibom and Cross River States. These DSD sites were mapped and linked to hypertension treatment facilities in a hub-and-spoke mechanism. Hypertension screening was integrated into the routine chronic care screening checklist and done by a lay worker using electronic sphygmomanometers.
Service providers were trained on screening, documentation, and follow-up referrals for clients with hypertension. Sphygmomanometers were also provided to the DSD sites. Post training supportive supervision and performance dashboards were used to monitor the screening.
PLHIV who commenced hypertension treatment had their ART refills aligned with their hypertension refill dates. We reviewed quarterly ART refill and hypertension screening data from the electronic medical records from October 2023 (Q1) to September 2024 (Q4) to determine the screening uptake.
Screening uptake was defined as the proportion of PLHIV accessing ART refills who had hypertension screening. We also compared the proportion of hypertension cases before (October 2023-March 2024) and after (April-September 2024) the start of the intervention.
Lessons learned: Over the 12 months, 63,799 clients received ART refills, 61.3% (39129/63799) were female, with median age of 39 years (IQR:32-45). Hypertension screening increased from 44.6% (6,412/14,365) in Q1 to 86.7% (13,028/15,019) in Q4 (p<0.001).
Of those screened, 2.3% (1,072/46,437) were diagnosed with hypertension, declining from 2.9% (183/6,412) in Q1 to 1.8% (240/13,028) in Q4 (p<0.001). Hypertension was higher among individuals aged ≥50 years (4.6% [321/7,049]), and least among those aged 15-24 years (1.6% [35/2,141]) (p<0.001).
Screening uptake was higher (78.7% [36,192/46,012]) at health facilities, compared to community pharmacies (57.6% [10,245/17,787]) (p<0.001). Key challenges experienced include inadequate screening equipment and access barriers to hypertension treatment.

Conclusions/Next steps: Integrating hypertension screening into DSD was effective, with improving uptake over time. This approach provides a replicable pathway for integrating other essential health services with DSD.

EP1056

Integrating NCD management into existing services: Experiences of added-on NCD services to previously dedicated HIV clinics in military facilities in Uganda

F. Akatukunda[1], L. Gahurra[1], M. Kiyuba[2], H. Musinguzi[1], T. Rwegyema[1], B. Lutimba[1], M. Ssemmanda Kyambadde[1], D. Bwayo[1]

[1]URC, Kampala, Uganda, [2]Uganda People's Defense Forces, Directorate of HIV, Kampala, Uganda

Background: In June 2022, the Ugandan Ministry of Health rolled out new HIV guidelines, highlighting the potential benefits of integrating noncommunicable disease (NCD) screening and management within HIV clinics. With funding from the Department of Defense HIV/AIDS Prevention Program (DHAPP), URC supported the Uganda People's Defense Forces (UPDF) to roll out the integration of NCDs. This abstract describes short term outcomes of this model of added-on NCD services to previously dedicated HIV care facilities in HIV clinics managed by the military in Uganda.

Description: The process commenced with a baseline assessment to identify the status regarding staffing, supply chain, and equipment needed for NCD integration in five high volume clinics. HIV clinic staff received specialized training to screen and manage NCDs, and health facilities were equipped with the necessary tools and logistics for effective NCD screening. The client clinic flow systems were reorganized to integrate NCD screening at triage points, managed by a trained health worker. Registers were provided to ensure proper documentation of screening results. Coordination with the main health facility pharmacy ensured co-location of NCD medicines.

Health workers were mentored on NCD integration, and periodic assessments were conducted using Ministry of Health's service quality assessment tools. By the end of the year, all facilities had successfully integrated NCD screening.

Lessons learned: Within 12 months of implementation, 80% of adult people living with HIV had been screened for hypertension, diabetes, and mental health. Successful integration of NCD management in HIV clinics requires tailored training of existing health workers, implementing basic protocols within established HIV clinics, modifying client flow, and providing basic equipment, such as glucometers, blood pressure machines, and stadiometers. The integration resulted in improved patient experiences by reducing waiting times.

However, key challenges included an increased workload for health workers and the inability to provide NCD medicines at no cost to patients, unlike antiretrovirals.

Conclusions/Next steps: A chronic care model of integrating NCD management within existing HIV clinics is feasible and will lead to early detection of NCD's, potentially leading to better outcomes. Varying supply chain systems that address both NCDs and HIV are needed to advance this model's benefits.

EP1057

Strengthening the blood pressure care and treatment cascade for people living with HIV at Entebbe regional referral hospital, Uganda

A. Syson[1], N. Phyllis[1]

[1]Entebbe RRH, Community Health, Entebbe, Uganda

Background: Uganda has a dual burden of NCDs and HIV/AIDS with an overall prevalence of pre-hypertension of 38.8% among its 42 million population. Adults-living-with-HIV experience more chronic metabolic complications because of both the HIV itself and ART. They are more likely to develop hypertension compared to HIV-negative individuals. By Quarter1, at ERRH, health care services for Hypertension and HIV/AIDS were organised in separate clinics making it difficult for a client with multiple conditions to access care. At each clinic visit, the client should be screened for the common NCDs particularly diabetes mellitus, hypertension and mental health, At Entebbe Regional Referral Hospital, in period Oct-Dec'23, our reports showed that 67% of clients seen were screened for Hypertension and 12% on treatment were controlled. The project was aimed at integrating Hypertension care into HIV Care.

Description: The 9-months-project aimed at 100% screening of clients at ART clinic for hypertension, management and ensuring blood pressure control among those identified with hypertension. Clinic meetings were held to identify and analyze the reasons for above performance.

An action plan was generated including re-arranging the clinic flow, attaching a triage Nurse, lobbying for antihypertensive medication due to less stock provided by GOU, buying BP machines, onsite mentorship of clinic staff, weekly performance reviews, daily clinic coverage by a doctor and daily health education on lifestyle modification.

Lessons learned: The number screened for HTN improved from 67% (474/707) in Q1 to 93%(1931/2079) by Q4. This was achieved through re-arranging the clinic flow and attachment of a fulltime triage nurse. The clients diagnosed with HTN increased from 13% (262/1396) in Q2 to 20% (420/1931) by Q4 as a result of improved screening and availability of a full time doctor.

Treatment increased from 32% (34/105) to 86% (217/252) with availability of a doctor. Blood pressure control rate improved from 12% to 45% (114/252) due to daily health education on lifestyle modification and availability of prescribed medication at no cost.

Conclusions/Next steps: Integrating care for HIV and hypertension is feasible, acceptable, less costly, improves hypertension control and is a possible solution to improving access to care among clients with multiple conditions

EP1058

Empowering HIV care with people-centered metrics: lessons from Uganda's most vulnerable populations

A. Lawino[1], E. Karamagi Nkolo[2], J. Hoover[3], H. Lule[2], R. Nekaka[4], L. Tumuhimbise[1], N. Kasunumba[1], P. Erem[1], T. Nsubuga Nyombi[2], J. Calnan[2], N. Buono[3], B. Korgaonkar[5], J. Nabwire Ssali[6], M. Bernard Etukoit[1]
[1]The AIDS Support Organization, Health, Gulu, Uganda, [2]USAID, Health and HIV, Kampala, Uganda, [3]USAID, Health and HIV, Washington DC, United States, [4]ANECCA, Moroto, Uganda, [5]Leapfrog to Value, Mumbai, India, [6]University Research Co., LLC, Kampala, Uganda

Background: In Uganda, reaching the UNAIDS 95-95-95 targets presents considerable challenges, particularly among children and adolescents, where viral suppression rates are notably low at 60% (Spectrum Estimate, 2022). Despite ongoing efforts, current clinical interventions often neglect vital social determinants of health.
This shortfall emphasizes the necessity for a comprehensive, client-focused approach to HIV care that addresses lived experiences and systemic obstacles faced by clients.
Description: A pilot initiative in the Acholi and Karamoja sub-regions introduced People-Centered Metrics (PCM) to deepen insights into individual client circumstances, focusing on quality of life and care experience. This year-long intervention targeted children and adolescents living with HIV aged 0–19 with high viral loads (≥1000).
The PCM methodology involved interviews with clients and caregivers to identify underlying causes of non-adherence, such as food insecurity, social isolation, and insufficient caregiver support.
Customized interventions, including directly observed therapy (DOTS), nutritional support, and community-based initiatives, were implemented in collaboration with local NGOs and healthcare providers.
Lessons learned: The intervention involved 898 children and adolescents, with 550 achieving viral suppression by the program's end. Key outcomes showed steady improvements in people-centered metrics: the percentage of CALHIV with minimal or no HIV-related symptoms increased from 35% in January 2023 to 57% in December 2023. Mental wellness improved from 61% to 69%, social support from 54% to 65%, and experiences of minimal or no stigma rose from 89% to 91%.
Financial burdens decreased, with the proportion of families resorting to loans or selling belongings for HIV-related care dropping from 25% to 17%.
Recommendations for HIV services increased from 86% to 88%. Viral suppression rates improved significantly, rising from 69% to 82%, strengthening client-provider relationships. Health workers reported enhanced empathy and responsiveness, while clients noted better support and health outcomes.
Conclusions/Next steps: Integrating PCM into routine HIV care has shown substantial improvements in viral suppression, care experience, and quality of life for vulnerable populations. This approach highlights the significance of addressing social determinants and engaging clients comprehensively. Scaling this model nationally could address critical gaps in HIV care and accelerate progress toward achieving the 95-95-95 targets.

EP1059

Establishing the extent of multimorbidity burden through integration of community-based hypertension, and diabetes screening within an HIV programme in Zimbabwe

T. Bepe[1], K. Takarinda[1], M. Hove[1], N. Mushonga[1], P. Chimberengwa[1], E. Dhodho[1], S. Page-Mtongwiza[1], T. Chinyanga[1], C. Gwanzura[2]
[1]Organisation for Public Health Interventions and Development (OPHID), Harare, Zimbabwe, [2]Ministry of Health and Child Care, Harare, Zimbabwe

Background: Globally, there is a growing burden of non-communicable diseases (NCDs). Notable gaps exist in understanding the extent of coexisting chronic health conditions, such as hypertension and diabetes mellitus, among people living with HIV (PLHIV) in our context.
From December 2022 to December 2023, we implemented a community-based HIV/NCDs Integration program in the urban provinces of Bulawayo and Chitungwiza with the aim to increase access to Hypertension and Diabetes screening and treatment for PLHIV.
Description: In Chitungwiza, 25 community health workers (CHWs) living with HIV were trained through an intensive, two-day competency-based curriculum. The training covered effective health promotion techniques for NCDs and the use of digital blood pressure machines and glucometers. The CHWs conducted screening during follow-ups for services.
Community health workers referred individuals with elevated blood pressure and blood glucose readings to their local clinic for further management. In Bulawayo, screening was conducted in the community during outreach activities by nurses trained in the World Health Organization's Package of Essential NCD (PEN) interventions. Priority for screening was given to PLHIV aged 40 years and older.
Details of PLHIV who were screened were entered into the District Health Information Software (DHIS2) tracker to enable follow-up. A Chi-square test was used to evaluate differences in comorbidity between genders, geographic regions and age bands.
Lessons learned: Of the 4,853 PLHIV who underwent both blood pressure checks and glucometer tests, 63.7% (n = 3,091) were female. Hypertension was the most prevalent comorbidity, affecting 45.4% of those screened, while 1.5% (n = 75) were living with diabetes mellitus. The coexistence of HIV, diabetes mellitus, and hypertension was observed in 2.1% (n = 104) of PLHIV.
The analysis showed no significant differences in multimorbidity prevalence between genders or between the provinces of Bulawayo and Chitungwiza. However, a significant difference in multimorbidity was found across age groups ($p < .001$).
Conclusions/Next steps: The high prevalence of comorbidities with advancing age among PLHIV calls for a shift from disease-centric to person-centered programs to

improve their quality of life. This approach should include comprehensive screening for a broader range of comorbidities, to address health challenges faced by this population.

EP1060

Integrating mental health services into HIV programs: Nigeria's programmatic experience

T. Ojo[1], N. Otubu[2], M.-M. Akanmu[2], O. Adewole[2], O. Nwobi[2], V. Nwakolobi[2], A. Mustapha[2], N. Ahmad[2], A. James[2], J. Drakes[3], S. Dowling[3], A. Carmone[3], C. Amole[3], O. Fasawe[2], E. Duru[1], R. Oyewole[1], G. Ogunleye[1], E. Etiobhio[4]

[1]National Mental Health Programme, Abuja, Nigeria, [2]Clinton Health Access Initiative, Nigeria, Abuja, Nigeria, [3]Clinton Health Access Initiative, Boston, United States, [4]National HIV and STIs Control Programme, Abuja, Nigeria

Background: In Nigeria, mental health (MH) challenges disproportionately impact adolescents and young people living with HIV (AYPLHIV) compared to those without HIV (34.9% versus 23.1%), contributing to worse HIV outcomes. However, fewer than 10% of all persons in need receive MH care due to workforce shortages (~0.1 per 100,000). In 2024, Nigeria's Federal Ministry of Health (FMoH) and Clinton Health Access Initiative (CHAI), supported by the Elton John AIDS Foundation (EJAF), became one of the first countries to adapt WHO's mhGAP 3.0, integrating MH into HIV services utilizing non-specialist healthcare workers (HCWs).

Description: In November 2023, CHAI and the FMoH established a national Mental Health Technical Working Group to lead mhGAP 3.0 contextualization during stakeholder workshops, and develop a healthcare worker (HCW) toolkit to pilot.

A three-day training for HCWs was conducted on essential care and practice, depression, anxiety, suicide, and alcohol/substance use disorders to support piloting a decentralized MH screening and treatment model in six states, one from each geopolitical zone. A 3-day training was also held for Group Interpersonal Therapy.

Training and service delivery data are captured within CommCare and PowerBI. Pilot results are reviewed quarterly with stakeholders to support quality improvement and inform future recommendations for MH integration.

Lessons learned: Among the 131 HCWS (clinicians, nurses, case managers, adolescent peer supporters, and community cadres) trained, knowledge and attitude scores rose from 65% to 82% (p<0.001) following training.

HCWs activated services with MH talks and depression, anxiety and substance use disorder screenings integrated during routine visits in 17 ART clinics and one-stop shops (OSS) for key populations. From June to December 2024, 1,429 AYPLHIV were screened: 38% screened positive for depression, 19% for anxiety, 16% for both, and 24% reported suicidal ideation.

Clients are linked to psychosocial interventions, psychotherapy and/or specialists based on severity. Follow-up screenings measure impact.

Further, the FMoH has appointed state-level MH focal officers and encouraged ongoing mentorship by MH specialists to support implementation.

Conclusions/Next steps: Preliminary results indicate the feasibility of MH-HIV integration, with improved HCW capacity and client screenings. Mental health outcomes will be evaluated to confirm effectiveness and inform scale-up recommendations.

EP1061

Impact of family planning integration on uptake of HIV testing services in Lesotho: evidence from the Baylor CoHipSEC Project, Berea

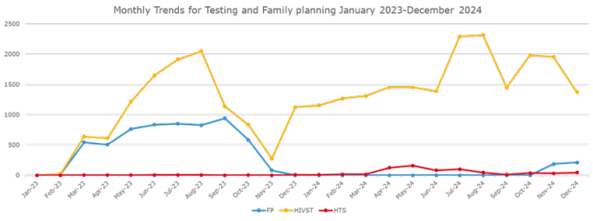
V.M. Mosate[1]

[1]Baylor College Of Medicine Children's Foundation Lesotho, CoHipSEC, Berea, Lesotho

Background: The integration of family planning (FP) services within HIV programs has been shown to enhance HIV testing services uptake. This study assesses the impact of FP service integration on HIV testing uptake within the Baylor CoHipSEC (Comprehensive High Impact Community-Based HIV Prevention, Testing and Treatment) project in Berea, Lesotho. The objective was to determine the contribution of FP integration to HIV testing trends.

Methods: The project integrates sexual and reproductive health services with HIV prevention. Data were collected from service delivery reports from January 2023 to December 2024, focusing on HIV self-testing (HIVST), conventional HIV testing services (HTS), and FP uptake by age groups. This is a retrospective study to assess trends in HIV testing service uptake during and after FP stoppage. Trend analysis was used to correlate FP uptake with HIV testing service trends.

Results: From January2023 to December 2023, when FP was integrated, a positive relationship between FP services and HIV testing uptake was observed. However, after FP services ceased in September 2023, a significant decline in HIV testing occurred. HIVST peaked in July 2023 with over 2,000 tests but dropped sharply by October 2023, coinciding with the reduction in FP services. The project then employed other strategies to increase HIV testing among adolescent and young women.



YEARS	HIV SELF TEST	HTS	FAMILY PLANNING
15-19	220	23	57
20-24	7395	136	2103
25-29	9213	207	3779
30-34	2572	155	161
35-39	1791	76	110
40-44	994	53	77
45-49	608	24	39

Conclusions: The findings underscore the effectiveness of integrating FP with HIV services. Higher uptake of HIV testing during FP visits demonstrates the potential of integrated models to reach underserved populations and improve HIV prevention, treatment, and care.

EP1062

integrated HIV and syphilis prevention in Zambia: advancing the fight against maternal and paediatric HIV through dual screening and treatment interventions

H. Lubemba[1], P. Cheche[1], N. Nyambe[1], O. Chibebe[1], C. Phiri[2], M. Qiu[3], M. Van de Reep[3], A. Konstantinova[4], P. Mulenga[2]
[1]Evidence Action, Lusaka, Zambia, [2]Ministry of Health, Lusaka, Zambia, [3]Evidence Action, Nairobi, Kenya, [4]Evidence Action, Wshington, United States

Background: Mother-to-child transmission (MTCT) of HIV and syphilis remains a major global public health challenge. Each year, over 350,000 adverse birth outcomes are attributed to syphilis, with sub-Saharan Africa accounting for 65% of the global burden of congenital syphilis. In Zambia, 4% of 700,000 antenatal care clients acquired syphilis. Although HIV incidence has decreased significantly due to robust testing programs, syphilis increases the risk of HIV transmission by 2.5 times and contributes to adverse pregnancy outcomes. Early detection and treatment of syphilis reduce complications and lower pediatric HIV incidence.
This abstract highlights Zambia's HIV and syphilis integration program, aiming to address co-infections in pregnant women.
Description: The Ministry of Health, in partnership with Evidence Action and other stakeholders, is implementing a program to integrate HIV and syphilis testing in antenatal care (ANC). The initiative includes training healthcare workers (HCWs) and community health workers (CHWs) to perform dual HIV/syphilis testing and management. The program is being rolled out in phases, with the first phase launched in April 2024, expanding services to 836 high-volume facilities. Over 11,038 HCWs and CHWs have been trained. A second phase, started in December 2024, targets an additional 1,042 medium-volume facilities. The program employs cost-effective, innovative strategies to improve maternal and child health outcomes.
Lessons learned: Integrated care streamlines service delivery, maximizes resources, and improves health outcomes. Community engagement builds trust, reduces stigma, and promotes health-seeking behaviors. Capacity building enhances case management and quality of services, while expanding health coverage improves accessibility and equity, fostering sustainable health systems.
Conclusions/Next steps: The dual HIV/syphilis testing program has contributed to reducing MTCT and improving maternal and child health outcomes in Zambia. Continued investment in training, community engagement, and innovative strategies is critical to scaling interventions nationwide and eliminating MTCT of HIV and syphilis.

EP1063

An AI-powered WhatsApp chatbot for chemsex harm reduction in South African men who have sex with men (MSM): exploring user engagement and preliminary implementation findings

S. Mjindi[1], D. Nel[1], M. Slabbert[1]
[1]OUT LGBT Wellbeing, Harm reduction and sexualized drug use, Pretoria, South Africa

Background: This project investigates the feasibility and preliminary impact of an AI-powered WhatsApp chatbot as a novel harm reduction intervention for MSM engaging in chemsex. Recognizing the limitations of traditional harm reduction service delivery models, this project aims to provide immediate, accessible and anonymous support for MSM who actively engage in chemsex through a sustainable, cost-effective, AI-driven platform.
Description: The closed-system, dynamic-interface chatbot was designed to engage users in confidential conversations, collecting data on inquiries related to substance use, safer sex practices, harm reduction advice, mental health, and referrals to relevant health services.
Interaction logs were systematically collected from the AI platforms back-end and analyzed using an Excel database to identify key themes, user needs, patterns of engagement and outcomes.
Lessons learned: Preliminary findings demonstrate high levels of user engagement with the AI WhatsApp chatbot, with frequent inquiries concerning chemsex substances (72%), safer sex practices (17%), drug interactions and knowledge (2%), and mental health support (9%). However, a significant proportion of user sessions were prematurely terminated (34%), suggesting potential barriers to sustained interaction.
The data reflecting 66% successful electronic assistance, however, indicates a demand for personalized and immediate harm reduction intervention and resources.
This preliminary data highlights the potential of AI-powered chatbots as a scalable and accessible platform for disseminating harm reduction information within the chemsex community. The non-judgmental and anonymous nature of the chatbot may encourage disclosure of sensitive information and facilitate engagement with harm reduction resources.
Conclusions/Next steps: Future iterations of this intervention should prioritize strategies to enhance user engagement and address the factors contributing to session abandonment.
Continuous data analysis and refinement of the chatbot's content and functionalities based on emerging trends in chemsex behaviors are crucial for maximizing the effectiveness of this innovative harm reduction approach.

Innovations in data collection, monitoring and evaluation

EP1064

Differentiated service delivery preferences of a sample of clients receiving antiretroviral therapy (ART) from a tertiary hospital in Lusaka, Zambia

I. Bwalya[1]

[1]*Ministry of Health, University Teaching Hospital, Lusaka, Zambia*

Background: Differentiated service delivery (DSD) models for HIV care are client-centred models that facilitate efficient HIV services delivery; while overcoming structural barriers that limit access to care. However, evidence suggests that client perspectives of DSD models may differ from health provider perspectives. We carried out a survey among clients receiving ART at a referral hospital in Lusaka, Zambia, to determine their preferred DSD models.
Methods: This was a facility-based survey conducted in 2022. Clients were interviewed on alternate days after a scheduled ART visit. All adults who were virologically suppressed, on ART for more than 6 months and free of any opportunistic infections were considered eligible. A semi-structured questionnaire was use to obtain demographic information and DSD preferences.
Results: A total of 106 clients were interviewed. 42 (39.6%) were male and 64 (60.4%) were female. The ages of the respondents ranged from 18 years to 75 years. The mean age was 42.03 years. The majority of respondents (57.5%) were married. 22.7% were single; 10.4% were widowed while the remaining 9.4% were divorced. 44.3% had received tertiary level education while a corresponding 44.3% had attained secondary level education. 9.4% had attained only primary level education while 2% had no education at all.
The majority of the respondents (83%) preferred to continue scheduled hospital reviews and drug pick-ups rather than community or pharmacy-based DSD models. This is highlighted in the table below:

Type of DSD Model	Number of Patients preferring the model
Community Adherence Group	4 (3.8%)
Urban Adherence Group	1 (0.9%)
Community Pharmacy model	4 (3.8%)
Individual community drug pick ups	9 (8.5%)
Scheduled Hospital drug pick ups	88 (83%)

64 respondents (60.4%) were concerned about disclosure when ART is provided in the community. There was a significant association between type of DSD model and concern of disclosure (p=0.007). There was no significant difference in proportion of individuals concerned about disclosure among clients who had been on ART for less than 5 years; compared to clients on ART for more than 5 years (P=0.647).
Conclusions: There are concerns about disclosure of HIV status when ART is provided via community-based DSD models. Scheduled hospital pick-ups should be continued for clients concerned about disclosure.

EP1065

Understanding predictors of interruption in treatment among Haitian migrants and their descendants living with HIV in the Dominican Republic

C. Casalini[1], K. Stankevitz[1], M. Cassell[1], N. Persaud[1], M. Goggin-Kehm[2], J. Michel[2], R. Joseph[2], G. Martinez[2], R. Diaz[2], J. Martinez[2], S. Saint-Hilaire[2], R. de Leon[2], M. Contreras[3], M. De Los Santos[4], M. Garcia[5], L. Tamares[6], M. Villar[7], Y. Ubiera[7], L. Reyes[8], B. Ciprian[9], D. Jones[10], A. Soto[2]

[1]*FHI360, HIV, Washington, DC, United States,* [2]*FHI360, HIV, Santo Domingo, Dominican Republic, the,* [3]*Batey Relief Alliance Dominicana, HIV, Santo Domingo, Dominican Republic, the,* [4]*Fundacion Activo 20-30, HIV, Santo Domingo, Dominican Republic, the,* [5]*Dominican Institute of Virological Studies, HIV, Santo Domingo, Dominican Republic, the,* [6]*Aid for AIDS, HIV, Santo Domingo, Dominican Republic, the,* [7]*Asociación Dominicana de Planificación Familiar, HIV, Santo Domingo, Dominican Republic, the,* [8]*Clínica Esperanza y Caridad, HIV, Santo Domingo, Dominican Republic, the,* [9]*Clínica de la Familia La Romana, HIV, Santo Domingo, Dominican Republic, the,* [10]*Divina Providencia, HIV, Santo Domingo, The Dominican Republic*

Background: UNAIDS set a goal for 95% of antiretroviral therapy (ART) clients to reach viral load suppression (VLS) to end the AIDS epidemic. However, migrants face socioeconomic challenges that impact their ART adherence, resulting in interruption in treatment (IIT), which negatively affects VLS. In the Dominican Republic (DR), the Enhanced HIV Services for Epidemic Control (EHSEC) project offers HIV treatment services to Haitian migrants and their descendants through eight local partners. From January through December 2023, EHSEC reported 988 IITs among 18,866 clients on ART, equivalent to 5% IIT.
We explored the factors associated with IIT among ART clients at 16 EHSEC clinics (nine public, seven local partner-led) in five provinces (National District, Santo Domingo, La Romana, Monte Plata, San Pedro de Macoris) in the DR.
Methods: We defined IIT as missing ART refill by ≥28 days. Using routinely collected project data (January–December 2023), we conducted descriptive analyses followed by bi-variate analyses to identify factors associated with IIT. We employed multivariate logistic regression with backward elimination to calculate odds ratios (OR) and corresponding confidence intervals (CIs). Statistical significance was determined at a threshold of p<0.05.
Results: At multivariate regression, the following factors were significantly associated with IIT: male (OR 1.16; p <0.001; CI 1.05-1.27), pregnant (OR 1.40; p <0.001; CI 1.40-4.84), receiving ART at public facilities (OR 2.30; p <0.001; CI 1.96-2.70), residing in the National District (OR 4.19; p <0.001; CI 3.48-5.04) and Monte Plata province (OR 1.96; p <0.001; CI 1.53-2.49), six months to one year on ART (OR 1.52; p <0.001; CI 1.16-1.99), one to five years on ART (OR 1.34; p 0.03; CI 1.03-1.73), undocumented initial CD4 test (OR 1.43; p <0.001; CI 1.17-1.74), undocumented initial viral load (OR 1.80; p <0.001; CI 1.48-2.19), and last viral load >1,000 copies/mL (OR 4.62; p <0.001; CI 4.08-5.24).

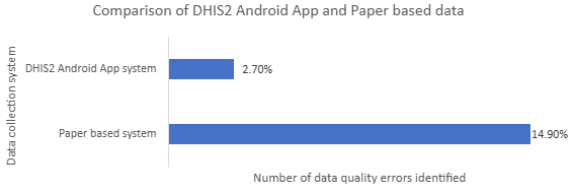
Conclusions: These results highlight key demographic, service-related, and clinical factors linked to IIT. These findings are critical to identify risk-specific interventions to create a model to predict the probability of ITT among currently supported ART clients so that they may automatically be offered enhanced case management.

EP1066

DHIS2 Android app improving data quality and service delivery of community health care services programs. Case study of DREAMS SMART program in Manicaland and Masvingo provinces of Zimbabwe

B. Kashiri[1], V. Mubaiwa[1], T. Sanyatwe[1], C. Mukwekwezeke[1], T. Chidenge[1]
[1]FACT Zimbabwe, Strategic Information and Research, Mutare, Zimbabwe

Background: DREAMS (Determined, Resilient, Empowered, AIDS-Free, Mentored and Safe) program piloted DHIS2 Android app with 95 club mentors (April to September 2024) to improve security and quality of data reported under DREAMS through mobile technologies. Since DREAMS inception (2016) in Zimbabwe the program used paper-based data collection systems.
Consequently, collection, collation, compilation, analysis and reporting of data faced with data quality problems resulting in incomplete, inaccurate, and untimely data which is not useful for decision making. In response FACT piloted DHIS2 Android app on tablets in Mutare district. The application can capture real-time data at the community level with enforced data validations and directly synchronizes with the national database.
Description: FACT Zimbabwe is implementing an HIV prevention program (DREAMS) in Masvingo and Manicaland provinces of Zimbabwe funded by USAID targeting Adolescents Girls and Young Women (AGYW). FACT utilized 95 trained club mentors to collect data using mobile devices over a period of 6 months. The Application allowed club mentors to enroll participants into the program, capture sessions and e-referrals. Bi-weekly tailored support was provided to all-club mentors, this ensured timely data synchronization and error rectification. Mobile Device Management system (MDM) used to enforce password security. A desktop review was done to compare quality of data collected through DHIS2 Android app in Mutare against paper-based data in Chipinge and Makoni.
Lessons learned: DHIS2 Android app presented unprecedented potential for community health programs to move from era of less reliable data collection and reporting system to more ideal situation of availability and use of quality health information for decision making. Districts with paper-based systems presented 14.9% data quality issues while Mutare has 2.7% (12.2% improvement).



Conclusions/Next steps: Mobile data collection proved to be effective with strengthened cadre support and adequate internet connectivity. Next phase the program will scale up use of tablets to all 6 DREAMS implementing districts.

EP1067

MesoCare revolutionizing HIV care through AI-powered assistance

S. Ivan[1,2], C. Mungai Nduta[3]
[1]Zeus Incorporated, Software & AI, Kampala, Uganda, [2]Kampala International University, Software & AI, Kampala, Uganda, [3]Kenyata University, ITC, Nairobi, Uganda

Background: Timely, accurate, and patient-centered healthcare is essential for effective HIV management, especially in resource-constrained settings. The MesoCare Smart Health Platform, developed by Zeus Inco, integrates the MesoChatbot and a mini robot HIV CONSULTANT AI Agent to revolutionize the continuum of HIV care. By leveraging advanced AI algorithms, medical big data, and robotics, MesoCare enhances diagnostic accuracy, improves treatment adherence, and provides personalized patient support while optimizing supply chain solutions.
Description: The MesoCare platform features:

1. MesoChatbot: A conversational AI tool providing tailored advice, medication reminders, and emotional support for individuals living with HIV and their caregivers.
2. Mini Robot HIV CONSULTANT AI Agent: A robotic assistant offering in-clinic and remote consultation, capable of providing drug recommendations, guiding treatment decisions, and facilitating seamless communication between patients and healthcare providers.
3. Integrated Supply Chain Solutions: A database of verified suppliers enables users to order medications or health-related supplies directly through the mini robot, with delivery tracking and payment options.

A pilot implementation was conducted across three clinics in Uganda involving 500 individuals living with HIV and 50 healthcare professionals.
Lessons learned: Preliminary findings indicate a 40% increase in diagnostic efficiency and a 35% improvement in ART adherence due to medication reminders and personalized support. The mini robot HIV CONSULTANT significantly enhanced patient engagement, with 75% of users reporting satisfaction with its in-clinic services. Additionally, the supply chain feature streamlined access to essential medications, with over 60% of patients utilizing delivery services.
Conclusions/Next steps: The MesoCare Smart Health Platform, powered by MesoChatbot and the mini robot HIV CONSULTANT AI Agent, represents a transformative approach to HIV care delivery. Its ability to provide accurate diagnostics, personalized support, and efficient medication access has demonstrated significant potential to improve patient outcomes. Future iterations will focus on expanding its database, multilingual support, and scaling its deployment globally.

EP1068

Active case finding and linkage to care of children living with HIV in Cameroon is an effective strategy towards pediatric HIV/AIDS elimination: findings from the 2024 Pediatric Surge

J. Fokam[1], D. Dombou[2], M. Mayer[3], W. Wu[4], A. Ketchaji[2], L.C. Keleko[3], A. Zeh Meka[1], E. Muna[5], P. Omgba[1], A. Messeh[1], S.C. Billong[2], Z. Ebongo Nanje[6], P. Tjek[6], C. Awa[7], G. Che[7], A. Yeffou[8], P. Tih[8], W. Kum[8], N. Musaga[9], F. Minjiwa[9], A. Ebot[9], A. Fang[10], C. Tchanou[10], J. Ewane[10], G. Tayong[11], A. Mefang[11], G.L. Ekali[11], A. Czerminski[4], A. Drabko[4], D. Bilicki[4], J. Chen[4], Y. Moussa-Fadil[3], T. Ayukotabe[3], K. Tse Nkwoh[3], J. Shang[3], K. Sato[12], S. Lloyd[12], S. Ghosh[12], J. Kariuki[12], T. Bakkali[13], R. Ajeh[14], M.F. Jalloh[3]

[1]Cameroon Ministry of Public Health, National AIDS Control Committee, Yaounde, Cameroon, [2]Cameroon Ministry of Public Health, Directorate of the Fight Against Diseases, Epidemics, and Pandemics, Yaounde, Cameroon, [3]U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Yaounde, Cameroon, [4]Quantitative Engineering Design (QED.ai), Lilongwe, Malawi, [5]Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, Yaounde, Cameroon, [6]Cameroon Ministry of Public Health, Directorate of Family Health, Yaounde, Cameroon, [7]U.S. Department of Defense, Defense HIV/AIDS Prevention Program, Yaounde, Cameroon, [8]Cameroon Baptist Convention Health Board, Bamenda, Cameroon, [9]Elizabeth Glaser Pediatric AIDS Foundation, Douala, Cameroon, [10]Georgetown University, Yaounde, Cameroon, [11]ICAP at Columbia University, Maroua, Cameroon, [12]U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, [13]UNAIDS, Cameroon Country Office, Yaounde, Cameroon, [14]Cameroon Ministry of Public Health, Coordination Unit for HIV, TB and Malaria, Yaounde, Cameroon

Background: Fewer than 100 of over 6,000 estimated undiagnosed children living with HIV in Cameroon are typically diagnosed monthly. A robust case finding strategy is critical for closing gaps in the pediatric treatment cascade. We aimed to identify undiagnosed HIV in children/adolescents and screen for tuberculosis (TB), immunization gaps, and malnutrition.

Description: The Pediatric Surge was implemented by integrated facility-led teams (n=1,012 teams) targeting unidentified HIV-positive children/adolescents (0–19 years) in the communities of all 10 regions during July 28–November 30, 2024. Using a district-based approach, HIV testing was offered to children/adolescents born to pregnant women not tested during antenatal care (ANC), women tested positive but who did not deliver at the facility, and HIV-positive mothers with children of unknown HIV status. Children/adolescents were screened for TB, immunization gaps, and malnutrition. Data collection, descriptive indicator-based analysis, and visualizations were performed using ScanForm AI technology, which digitized forms and tracked progress with an automated dashboard.

Lessons learned: The Pediatric Surge reached 132,553 people, with 96,921 tested for HIV: 63,518 children (0–14 years), 13,188 adolescents (15–19 years), 17,709 adult caregivers (≥20 years), and 2,506 persons age unknown. A total of 2,814/96,921 (2.9%) people tested positive for HIV, varying by age: children (1.1%), adolescents (2.8%), adult caregivers (9.4%). Among new HIV diagnoses, 719/2,814 (25.6%) were children and 368/2,814 (13.1%) were adolescents, with an average of 180 and 92 cases identified monthly, respectively; 74.0% initiated ART same day and 24.8% initiated later. Of 1,204 children/adolescents eligible for TB preventive treatment (TPT), 51.3% initiated TPT and 22.6% were referred for evaluation.

Among 7,934 children <2 years with a vaccination card, 714 (9.0%) were not fully vaccinated and referred for immunization. Of 22,168 children <5 years screened, 1,248 (5.6%) were under-nourished and referred for nutritional supplementation.

Conclusions/Next steps: The Pediatric Surge was a successful model that nearly doubled HIV case finding for children and adolescents in Cameroon, linking to care above the expected 95% target.

Notable numbers of under-vaccinated and under-nourished children were also reached and referred for management. This integrated district approach can be a model for routine community outreach to eliminate pediatric HIV/AIDS.

EP1069

Revolutionizing digital health: utilizing the courier logistics application for sustainable sample referral

B. Bbole[1], T. Machila[1], P. Choonga[2], T. Tembo[3]

[1]Centre for Infectious Disease Research in Zambia (CIDRZ), Strategic Information, Lusaka, Zambia, [2]Centre for Infectious Disease Research in Zambia (CIDRZ), CIDRZ TRAILS Project, Lusaka, Zambia, [3]Centre for Infectious Disease Research in Zambia (CIDRZ), Research, Lusaka, Zambia

Background: Efficient sample referral systems are pivotal for timely and accurate laboratory diagnostics, particularly for viral load (VL), early infant diagnosis (EID), human papillomavirus (HPV), and tuberculosis (TB). Historical reliance on paper-based systems led to incomplete data, missed diagnostic opportunities, suboptimal treatment outcomes, and inefficiencies. To address these challenges, the Courier Logistics App was introduced to streamline sample referrals and strengthen health systems.

This abstract highlights the app's implementation and transformative impact on laboratory services in Zambia.

Description: Developed by the Centre for Infectious Disease Research in Zambia (CIDRZ), the Courier Logistics App is operational across CDC-supported provinces since 2022. Built on Microsoft SQL Server, it integrates a web application and an Android mobile app. Administrators oversee courier metrics, rider assignments, and facility management, while riders use the app for sample pick-ups, including on-demand requests, refueling, and maintenance logs. Real-time data visibility through the web interface supports monitoring, planning, and rapid issue resolution. Key indicators tracked include trip rates, fuel usage, sample volumes, and results distribution efficiency. The app also incorporates automated route optimization to enhance logistics.

Lessons learned: The Courier Logistics App has been instrumental in improving sample referral processes and enhancing health system efficiency. Its implementation has demonstrated the value of transitioning from paper-based systems to a digital platform, leading to significant improvements in data completeness from 35% to 90%.

Real-time data availability has enabled performance monitoring, routes optimization, and effective resource allocation, reducing operational costs and improving service delivery. The integration of diverse diagnostic specimen types has streamlined processes, ensuring timely and reliable transport of samples.

Challenges, such as initial resistance to adopting new technologies, were overcome through targeted capacity-building initiatives, highlighting the importance of stakeholder engagement and training in driving innovation.

Conclusions/Next steps: The Courier Logistics App represents a scalable and eco-friendly innovation in digital health. By eliminating paper-based inefficiencies, it optimizes sample referrals, strengthens health systems, and enhances patient outcomes.

Future steps include scaling implementation nationwide, integrating additional diagnostic parameters, and refining predictive analytics to preempt logistical bottlenecks. This innovation sets a precedent for sustainable, data-driven health solutions globally.

EP1070

Implementation of HIV case-based surveillance using a centralized approach in Uganda

S. Ssevvume[1], G. Timbihurira[1], E. Kansiime[1], A. Mirugwe[1], A. Namale[1], D. Baluku[1], E. Akello[1], S. Lubwama[1], J. Mpango[1], P. Mbaka[2], K. Musenge[3], S. Ssendagala[4], E. Sande[3]
[1]Makerere University, School of Public Health, Kampala, Uganda, [2]Ministry of Health, Division of Health Informatics, Kampala, Uganda, [3]Centre for Disease Control Uganda, Health Informatics, Kampala, Uganda, [4]Centre for Disease Control Uganda, Surveillance, Kampala, Uganda

Background: Uganda has scaled up Antiretroviral Therapy (ART) to 2,400 facilities, with data captured via Point of Care (PoC) systems or retrospective Electronic Medical Records (EMR) entry. However, fragmented and inaccessible HIV data limits national surveillance and tracking of sentinel events. To address this, a process was developed to transmit HIV client-level data to the Ministry of Health's (MoH) central database, enabling comprehensive surveillance and longitudinal case analysis.

Description: Our approach automated sharing of client clinical information from EMRs using an Application Programming Interface (API) infrastructure integrating data into the Central database. Data from an EMR is compiled as FHIR (Fast Healthcare Interoperability Resources) resources with client demographics and clinical information. These resources are stored in the database. Data is then transmitted through Extract Transform and Load (ETL) pipelines to corresponding analysis tables for analysis.

Lessons learned: Data-driven monitoring dashboard and monthly case level analyses support multi-level insights (national to facility) into HIV client care effectively tracking sentinel events and treatment outcomes. These insights can then be used to guide targeted validation and mentorship to improve data quality and enhance client care outcomes.

Conclusions/Next steps: Scaling up national case surveillance to facilitate real-time HIV program monitoring, enhance MoH oversight, and strengthen programmatic support across all service levels. This initiative will improve tracking of sentinel events and treatment outcomes, ensuring comprehensive care and effective epidemic control.

EP1071

Optimizing the continuation of treatment initiative: harnessing data and community involvement in Manicaland and Midlands Provinces, Zimbabwe 2024

K. Nyathi[1], T. Nyamundaya[1], M. Ndlovu[1], B.N. Chindove[1], S.A. Mpande[1], T.P. Sibanda[1], M. Muzondo[1], R. Mataruse[1], P. Maringe[1], G. Choga[1], J.P. Mafara[1], O. Sibanda[1], P. Baloyi[1], J. Muguse[1], T. Makuni[1], A. Maravanyika[1], N. Ganje[1], T.V. Chimwaza[1], E. Tachiwenyika[1], T. Tafuma[1], N. Sithole[2], T. Matare[2], C. Mupanguri[2], M. Muchekeza[2], M. Mukuzunga[2], M. Mhangara[3], S. Mukungunugwa[3]
[1]Zimbabwe Health Interventions, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Harare, Zimbabwe, [3]United States Agency for International Development, Harare, Zimbabwe

Background: Zimbabwe Health Interventions (ZHI) supports the government of Zimbabwe to achieve and sustain HIV epidemic control in Manicaland and Midlands Provinces. This includes Continuity of Treatment (CoT) for People Living with HIV (PLHIV) as measured by growth in the number of PLHIV on Antiretroviral Therapy (ART), prevention of interruption in treatment (IIT), returning people experiencing IIT back to ART, ensuring that transfers are successful, and accurate record keeping for PLHIV on ART. Evidence show that PLHIV are likely to experience IIT at some point during their treatment.

Description: We implemented approaches to support CoT for over 200,000 Recipients of Care (RoC) *using data at above-site level*, and *expert clients from the community* and within health facilities. Monitoring of CoT granular data was done with use of PowerBI, and discussions on this held in the daily, project-wide, situation room meetings to ensure real-time interventions in minimizing IIT.

Metrics on CoT were compiled, analyzed and displayed monthly by district and facility using excel based dashboards called ART Retention Monitors thereby enabling targeted supportive supervision by above-site staff and facility managers.

Empowered and motivated expert clients reinforced CoT safeguards, strengthening appointment and defaulter tracking systems. At least 453 expert clients provided peer-to-peer support and ensuring traceability of RoC. Expert clients were empowered though training, cell-

phones with airtime, bicycles for transportation etc. Assessment was covered by the Medical Research Council of Zimbabwe protocol (MRCZ/E/159).

Lessons learned: From October 2023 to September 2024 there was an overall 2,155 growth in the number of PLHIV on ART, with the proportion of RoC in care rising from 89.5% (202,093/225,736) to 90.5% (204,248/225,736) of the annual target. There was a negative trend in the IIT. The return to treatment after default (within 28 days) was about 95% overall.

Conclusions/Next steps: ZHI demonstrated adoption of the PEPFAR 5*3 Strategy enablers by *leading with data* for identification of specific areas needing targeted support and *community leadership* in deploying sustainable strategies to optimize CoT. We recommend extensive deployment of innovative site level dashboards to other very key indicators and non-PEPFAR supported districts; and engagement of community cadres to support CoT and other key health areas.

EP1072

Supporting the linkage to ART using high frequency reporting and a cohort linkage tracker: experiences from Kwekwe district in Midlands Province Zimbabwe 2024

K. Nyathi[1], T. Nyamundaya[1], M. Ndlovu[1], B.N. Chindove[1], S.A. Mpande[1], T.P. Sibanda[1], T. Tafuma[1], M. Muzondo[1], G. Choga[1], P. Maringe[1], O. Sibanda[1], J. Muguse[1], P. Baloyi[1], T. Makuni[1], T.V. Chimwaza[1], S. Nonokai[1], R. Magutshwa[1], J.P. Mafara[1], N. Ganje[1], A. Maravanyika[1], N. Sithole[2], M. Muchekeza[2], M. Mhangara[3], S. Mukungunugwa[3], E. Tachiwenyika[1]

[1]Zimbabwe Health Interventions, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Harare, Zimbabwe, [3]United States Agency for International Development, Harare, Zimbabwe

Background: Zimbabwe Health Interventions (ZHI) is supporting the government of Zimbabwe to achieve and sustain HIV epidemic control in Manicaland and Midlands provinces. One key objective is finding remaining undiagnosed people living with HIV (PLHIV) not on treatment, testing and linking them to Antiretroviral Therapy (ART). Individuals testing positive for HIV are ideally offered same day ART initiation. ZHI monitors these Recipients of Care (RoC) and the high-frequency reports (HFR) generated from this data between October 2023 to September 2024 flagged Kwekwe district several times for suboptimal linkage to ART.

Methods: ZHI developed an online cohort (line list) tool for recording and tracking RoC who miss same day ART initiation across supported facilities. These RoC were followed up until either ART initiation or another outcome. Data from these activities is reported through the District Health Information Software (DHIS2) to generate cohort based weekly HFRs for real time granular data use, and cumulative monthly reports. Data from the DHIS2 and Cohort Linkage tool were downloaded and analyzed using Ms. Excel. Assessment was approved by the Medical Research Council of Zimbabwe (MRCZ/E/159).

Results: Though HFR consolidated monthly linkage ranged from 94% to 99%, Kwekwe linkages ranged from 87% to less than 95% yet it is the district with the highest number of newly diagnosed RoC 17% (1,784/10,385). Of 269 RoC captured in the cohort tracker with complete data, average age was 36 years, 50% being male, and 32% (85/269) had recency testing. Most i.e., 79% (212/269) delayed ART initiation due to Tuberculosis investigations or treatment, whilst others either had advanced HIV conditions or were transferred. Delay in ART initiation was up to over 60 days for 11% (29/269) of RoC. Following real time interventions, Kwekwe district recorded ART linkage of 96% (1,714/1,784) at year end.

Conclusions: The HFR was useful in identification of high volume, low performing districts/facilities in real time and the cohort linkage tracker innovation useful to characterize and address barriers for same day ART initiation, thereby optimizing linkage. We recommend continuous real-time granular data use at scale for identifying gaps and targeting interventions and use of innovations such as the cohort linkage tracker.

EP1073

Enhancing access to high-quality sexual reproductive health services for adolescents and young people in Zambia through Tiko's tech-enabled trusted and verified results (TVR) approach

A. Sikanyika[1], M. Njelesani-Kaira[2], J. Mwanza[1], C. Ndumba[3], N. Liywalii[1], H. Essendi[4]

[1]Tiko Africa Zambia, Operations, Lusaka, Zambia, [2]Tiko Africa Zambia, Country Director, Lusaka, Zambia, [3]Tiko Africa Zambia, Communications and Marketing, Lusaka, Zambia, [4]Tiko Africa NPC, Research & Analytics, Kenya, Kenya

Background: Adolescents and young people in Zambia face significant barriers to accessing sexual and reproductive health (SRH) services, including family planning, with 29% of young women aged 15-19 experiencing teenage pregnancies and over 13% of youth aged 15-24 living with HIV (Zambia Demographic and Health Survey, 2020). Only 38% of adolescents know where to access essential SRH services, revealing gaps in information, service quality, and credibility (Chikandiwa et al., 2019).

These challenges are exacerbated by cultural stigma, misinformation, and systemic gaps, such as unverified results caused by poor record-keeping, ineffective supply chains, and improper documentation. These issues hinder service continuation, adherence, and retention, limiting progress in improving SRH outcomes for this vulnerable group.

Description: To address these challenges, in October 2023, Tiko Africa Zambia launched the Trusted and Verified Results (TVR) Approach, a tech-driven strategy to improve adolescent and youth access to quality family planning services. By integrating evidence-based methods with community engagement, TVR fosters trust, combats misinformation, and overcomes cultural barriers. It ensures service quality through robust systems, supervision, and

capacity-building, including record-keeping training and client journey orientations. Providing reliable information within a supportive framework, Tiko empowers young people to make informed health choices, enhancing service uptake and health outcomes for this vulnerable group (UNFPA, 2021).

Lessons learned: Between October 2023 and January 2025, Tiko Africa significantly improved data quality across all Tiko-accredited facilities within five ecosystems comprising public and private health facilities. Service uptake was highest among 18- and 19-year-old girls, who accounted for 90% of the services. Tiko managed to reach 22,000 adolescents and young people, accessing 33,157 services. Of these clients, 87.97% were females, with the majority seeking family planning (52.4%) and HIV testing (47.6%), while male clients primarily accessed HIV testing and condoms. The rate of unverified numbers in family planning and other services like HIV testing and counselling decreased from 85% to 2%.

Conclusions/Next steps: Tiko Africa Zambia's TVR Approach improves adolescent and youth access to sexual and reproductive health services by integrating robust systems, community engagement, and evidence-based practices. To sustain impact, expanding to more private facilities, strengthening community outreach, and enhancing capacity-building for providers are recommended.

EP1074

Linkage to care of new HIV diagnoses at AHF-supported health facilities in Rwanda: key factors for success

D. Sebuhoro[1], N. Nteziryayo[2], J. Hakizimana[2], A. Nzeyimana[2], F. Kayitesi[1], L. Rangira[3], N. Dube[4], L. Buzaalirwa[5], C. Baribwira[6]

[1]Aids Health Care Foundation, Monitoring and Evaluation, Kigali, Rwanda, [2]Aids Health Care Foundation, HIV Prevention, Kigali, Rwanda, [3]Aids Health Care Foundation, Programs Management, Kigali, Rwanda, [4]Aids Health Care Foundation, Quality Improvement and Clinical Operations, Manzini, South Africa, [5]Aids Health Care Foundation, Quality Improvement and Medical Logistics, Kampala, Uganda, [6]Georgetown University, Independent Contractor, Kigali, Rwanda

Background: Linking newly diagnosed HIV clients to care is a major challenge in achieving the UNAIDS goal of eliminating HIV/AIDS as a public health threat by 2030. Rwanda's HIV program adopted Universal Test and Treat (UTT) in 2018, recommending same-day enrollment and ART initiation for all newly diagnosed HIV clients. Despite this, early retention of these patients remains difficult. To address this, AHF Rwanda embarked on an intensified follow up and adherence support for Newly enrolled clients for the first 3 months in care.

Description: AHF intensified linkage to care strategies in 38 health facilities in Rwanda entails monthly reviews of new HIV diagnoses and their linkage outcomes. In 2020, AHF introduced the "Track Positive"- a digital tracking system to enhance client tracking and ensure linkage to care. The system captures data for all new HIV cases and tracks clients until they complete two clinic visits to confirm linkage. Healthcare providers can quickly view clients' linkage status and offer adherence support to those who have not yet been linked to care.

Lessons learned: Before 2020, linkage rates had not been consistently improving despite healthcare providers reviewing positive cases, with rates 80% in 2016, 85% in 2017, 81% in 2018 and 86.7% in 2019. After the introduction of the "Track Positive" initiative, linkage rates steadily increased, reaching 91% in 2020 and 98% in 2024. The system serves as a communication bridge between testing points and treatment services, improving follow-up for new clients, preventing lost to follow-up, and helping healthcare providers track and document reasons for attrition.

Conclusions/Next steps: The introduction of the digital tool helped healthcare providers track newly diagnosed clients more effectively, improving linkage outcomes. It enabled providers to monitor all new HIV cases, remind them to follow up with clients who had not returned, and offer intensified adherence counseling as needed.

EP1075

Innovative approaches to monitoring CPD engagement for HIV education: insights from digital online CPD platform

S.O. Dube[1]

[1]EMGuidance, Clinical, Johannesburg, South Africa

Background: The purpose of this research was to evaluate the engagement and outcomes of a CPD activity, "Advancing Towards HIV Elimination: Strategies, Challenges, and Innovations (HIV-CPD),". The aim was to highlight the effectiveness of data-driven monitoring techniques in enhancing education and supporting healthcare professionals (HCPs) in managing people living with HIV (PLWHIV).

The hypothesis was that data-informed monitoring techniques can significantly enhance the effectiveness and reach of CPD activities by engaging diverse HCPs and aligning their educational needs with regional healthcare challenges.

The study analysed the challenges in equipping HCPs with up-to-date knowledge and skills to manage PLWHIV. The research sought to demonstrate how digital CPD platforms can bridge gaps and contribute to system-wide healthcare improvements.

Methods: The study was conducted over a six-month period from July 2024 to January 2025. Data was collected from a digital medical platform widely used by HCPs in South Africa. This was a retrospective observational study, which included HCPs registered on the platform, who had successfully completed the HIV-CPD activity. Data was collected using Mixpanel, a digital analytics platform, to track user interactions with the CPD content.

Additional analysis was conducted using excel for data visualisation and percentage calculations. Aggregated and anonymised data ensured compliance with ethical standards. Quantitative analysis was performed to assess completion rates, participation trends across provinces, and demographic distribution of participants.

Results: A total of 4,359 HCPs successfully completed the CPD activity, representing 8.7% of the platform's active users. Emergency medicine personnel accounted for the largest share of completions (51.3%), followed by general practitioners (64% of the doctor cohort). Provincial engagement varied significantly, with Gauteng leading at 59% of completions, followed by KwaZulu-Natal (24.3%) and Western Cape (16.7%). The CPD ranked fifth among all platform offerings, highlighting strong interest in HIV-related education.

Conclusions: This CPD activity demonstrates the impact of community-driven and data-informed approaches in scaling education for HCPs. Provincial variations in engagement align with regional HIV prevalence, emphasising the need for tailored strategies to address healthcare priorities. The findings underscore the value of digital platforms in supporting SDG 3 by fostering professional development and strengthening health systems through innovative monitoring and evaluation techniques.

EP1076

A longitudinal analysis of the clinical presentation and outcomes of individuals diagnosed with cryptococcal meningitis in Botswana

R. Healy[1], T. Leeme[1], J. Milburn[1], D. Ramaabya[2], T. Chebani[2], A. Avalos[3], M. Kapanda[4], O. Ntwayagae[5], M. Mosepele[6], J. Jarvis[1]

[1]London School of Hygiene & Tropical Medicine, London, United Kingdom, [2]Botswana Ministry of Health and Wellness, Gaborone, Botswana, [3]Botswana Harvard AIDS Partnership, Gaborone, Botswana, [4]Ministry of Health Botswana, Gaborone, Botswana, [5]Botswana - University of Maryland School of Medicine Health Initiative, Gaborone, Botswana, [6]University of Botswana, Faculty of Medicine, Gaborone, Botswana

Background: HIV-associated cryptococcal meningitis (CM) remains a major cause of HIV-related mortality. CM treatment in low- and middle-income countries has historically been based on inadequate fluconazole monotherapy; recent advancements have demonstrated the benefit of combination antifungals, including the AMBITION regimen based on a single, high-dose of liposomal amphotericin B (L-AmB).

We conducted a retrospective study to describe the clinical presentation, inpatient management, and outcomes of individuals diagnosed with CM in Botswana between 2014-2022, and explore changes over time.

Methods: We purposively selected the 13 hospitals in Botswana expected to treat the majority of CM cases in the country, including primary, district and referral centres. Cases diagnosed at those centres between 2014-2022 at primary centres and 2018-2022 at district and referral centres were identified through centralised laboratory records. Data for each individual were extracted from paper notes and laboratory records and analysed with descriptive statistics, chi-squared tests, and logistic regression.

Results: 650 cases of CM were diagnosed at the 13 centres during 2014-2022. Of those 47.8% (311/650) paper notes were obtained. Of the 311, median age at CM diagnosis was 38 years (IQR 32–43), 63% (196/311) male and baseline GCS <15 39.6% (122/309). Over time, liposomal amphotericin use increased significantly, with 52.4% of patients receiving L-AmB in 2022, compared to 6.3% in the combined years 2014-2021. Patients treated at primary and district and hospitals were less likely to receive L-AmB than those treated at referral hospitals (20.9% vs 5.81%). Inpatient mortality was 36.3% (113/311).

Survival outcomes were similar across facility type. Therapeutic lumbar punctures were associated with reduced odds of death (OR = 0.54, 95% CI: 0.32–0.91). Treatment with L-AmB based regimens was associated with significantly better odds of survival compared to amphotericin-B-deoxycholate-based regimens (OR = 0.29, 95% CI: 0.19-0.72, p = 0.008)

Conclusions: Significant disparities in CM management were observed depending on where people sought care. Improved outcomes were seen with L-AmB based therapy and appropriate management of raised intracranial pressure. These findings highlight the need for equal allocation of resources and training to ensure all people receive optimal care.

EP1077

Democratizing data: life mapping as a tool for community-led insights in Malawi and South Africa

G. Moses[1], J. Bozinovski[1], K. Lauer[1], S. Baptiste[2]

[1]ITPC Global, Watch What Matter Strategic Pillar, Johannesburg, South Africa, [2]ITPC Global, Johannesburg, South Africa

Background: COVID-19 continues to have a profound impact on global health, particularly in low- and middle-income countries, where the need for equal access to healthcare has never been more critical. In response to this challenge, ITPC initiated the COVID-19 Citizen Science project, a community-led effort to document real-time perspectives, experiences, and advocacy priorities among people living with HIV. Citizen Science departs from traditional ‚data-extraction' approaches and embraces ‚data-democracy' by combining community-led monitoring, operational research, and a unique methodology known as Life Mapping.

Description: The Life maps (LM) initiative provided participants with mobile phones, data and training, enabling them to document their experiences and share perspectives before, during and after the COVID-19 pandemic, including access to HIV and TB testing, prevention, and treatment services. LM participants were given super-heroes name, this ensures confidentiality. The LM participants document their day to day life experiences through photos and journaling. They drawn from different typologies including Sex Workers, young people, transgender communities among others.

In addition to the day too day documentation, the participants receive themes that they give information and data on. Some of the themes include stigma and discrimination, disclosure, water and sanitation, adherence

to treatment among others. To document and share the work done widely, an exhibition space was created that displays the work done:
https://citizenscience.itpcglobal.org/life-maps/gallery/
Lessons learned: Through the monthly themes data collected and the day-to-day documentation, the LM participants shared data and information that was key in policy advocacy and creation of home-solutions including having Sex Workers peers at health facilities. Interactions with other participants allowed them to share experiences and learn from each other. During the launch of the exhibition space, one of the LM participant highlighted "T*his project gave me a safe space to share my experiences with peers who supported me by listening and sharing their own lived experiences. It helped me address mental health challenges and alcohol abuse*."
Conclusions/Next steps: The Life Maps initiative has demonstrated the power of community-led approaches in generating actionable data, fostering resilience, and driving advocacy. Scaling up Life Mapping and similar participatory methodologies will further strengthen community ownership, data-driven decision-making, and advocacy for equitable healthcare access.

EP1079

Comparative analysis of adverse event incidence rates in the Voluntary Medical Male Circumcision (VMMC) sites from Dolo Project in Lilongwe District, Malawi (Oct 2020-Sept 2024)

S. Shire[1], G. Menego[2], G. Ngwinja[3], D. Nkombezi[4], M. Kapito[5], Z. Mwandi[6], J. Van't Pad Bosch[2], W. Msungama[7]
[1]Jhpiego, Monitoring, Evaluation and Research, Lilongwe, Malawi, [2]Jhpiego, Program Management, Lilongwe, Malawi, [3]Jhpiego, Service Delivey, Lilongwe, Malawi, [4]Jhpiego, Demand Creation, Lilongwe, Malawi, [5]Malawi Ministry of Health, HIV Department, Lilongwe, Malawi, [6]Jhpiego, Service Delivery, Nairobi, Kenya, [7]CDC Malawi, Biomedical, Lilongwe, Malawi

Background: Jhpiego Malawi has been supporting the Ministry of Health through Centers for Disease Control and Prevention funding to provide quality Voluntary Medical Male Circumcision (VMMC) services since 2016. Jhpiego is implementing the Dolo project (2020 - 2025) across 40 sites which aims at achieving saturation of comprehensive VMMC services in the Lilongwe district. VMMC is a critical component of HIV prevention strategies, yet an elective surgical procedure with inherent risks. Monitoring and analyzing adverse events (AEs) associated with VMMC is essential for ensuring patient safety and improving program outcomes.
Description: The analysis involved reviewing adverse event data from 14 VMMC sites in Lilongwe District, which had clients who experienced AEs for the period October 2021 to September 2024. Data was collected from clinical records, incident reports, and follow-up visits. The types and frequencies of adverse events were categorized and compared across 14 sites which were purposively selected based on occurrence of AEs. AE incidence rates were calculated by counting the total number of adverse events for the site divided by the total number of male circumcisions (MCs) performed for the site during the analysis period. Statistical methods, including a Chi-Square test for goodness of fit, were used to identify significant differences and trends.
Lessons learned: Out of 241,776 MCs, 25 AEs were identified: 88% (22) moderate and 12% (3) severe. Bleeding was the most common (60%, 15), followed by infections (24%, 6), Shang Ring displacement (8%, 2), and moderate pain (8%, 2). The Chi-Square test showed significant differences in the adverse event rates across sites (p-value: 0.0004).
Area 28 VMMC Centre had the highest incidence rate at 0.097% (7/7241), while Diamphwe had the lowest at 0.013% (1/7941). Kachale and Chimbalanga Health Centres had rates of 0.044% (3/6795) and 0.031% (2/6438), respectively.
Conclusions/Next steps: The analysis revealed generally low adverse event rates, highlighting the importance of continuous monitoring and targeted interventions to enhance VMMC program safety and effectiveness.
Significant differences in adverse event distribution across sites would benefit from tailored strategies to address specific challenges, maintain high standards of patient care, and improve overall program outcomes.

EP1080

Predictive modelling of cervical cancer risk in women aged 15-49 years in Manicaland and Midlands provinces for the period October 2020 to September 2021

C. Denga[1], E. Tachiwenyika[1], M. Ndlovu[1], T. Chimwaza[1], M. Muchekeza[2], S. Mukungunugwa[3], M. Mhangara[3], T. Nyamundaya[1]
[1]Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, [2]Ministry of Health and Child Care of Zimbabwe, Provincial Medical Director, Gweru, Zimbabwe, [3]USAID, AOR, Harare, Zimbabwe

Background: Cervical cancer (CC) remains a significant public health challenge globally and in Zimbabwe. Early identification of women at risk is crucial for effective prevention and treatment.
This study aimed to develop and compare the performance of two predictive models, Random Forest, and Logistic Regression, for assessing cervical cancer risk among women aged 15-49 years in Manicaland and Midlands provinces of Zimbabwe.
Methods: A secondary dataset of 2,494 women, including 17 demographic and clinical predictors, was utilized for model development. The data were split into training (70%) and test (30%) sets. Logistic regression was employed for its simplicity and interpretability, while Random Forest was chosen for its ability to capture complex relationships between variables. Stepwise variable selection was applied to the logistic regression model to retain significant predictors, and hyperparameter tuning was conducted for the Random Forest model to optimize its performance. Both models were evaluated using metrics Area Under the Curve (AUC), recall, precision, and F1 score. The study was approved by Medical Research Council of Zimbabwe (MRCZ/E/159).

Results: The Logistic Regression model slightly outperformed the Random Forest model in terms of AUC (0.6283 vs. 0.6208). It also demonstrated higher recall (83.79% vs. 49.94%), indicating better sensitivity in identifying true positive cases. However, the Random Forest model had a higher precision (67.43% vs. 63.51%), suggesting better accuracy in its positive predictions. Significant predictors of CC among adult women identified by the Logistic Regression model and Random Forest model included age, parity, lifetime sexual partners, sexual debut, HIV status, and whether the client was on ART.

Conclusions: Logistic regression's higher recall suggests it may be more suitable for identifying at-risk individuals, which is crucial in preventive health strategies.

However, the precision of the Random Forest model highlights the trade-offs between different performance metrics and the importance of context-specific model evaluation.

Independent predictors of CC among adult women included age, parity, lifetime sexual partners, sexual debut, HIV status, and whether the client was on ART. We recommend piloting the model on real time data and integrate it with electronic health record (EHR) systems.

EP1081

Using sub-national community-led monitoring data to enhance gender and population equity in HIV testing in Malawi and South Africa

J. Bozinovski[1], K. Lauer[1], G. Oberth[2], R. Tionenji Ng'ong'ola[1], K. Zokwana[1], J. Harries[2], S. Baptiste[1], M. Soboyisi[3], H. Kachepatsonga[4]

[1]International Treatment Preparedness Coalition Global, Johannesburg, South Africa, [2]University of Cape Town, Cape Town, South Africa, [3]NACOSA, The Networking HIV and AIDS Community of Southern Africa, Cape Town, South Africa, [4]MANERELA+ (Malawi Network of Religious Leaders Living with or Personally Affected by HIV and AIDS), Lilongwe, Malawi

Background: HIV testing is a critical entry point into prevention and treatment programs. Yet, there are marked inequalities in access to this service. In South Africa, 81.8% of women have ever tested for HIV versus 69.0% of men. In Malawi, the most recent biological and behavioral survey found that 27.7% of sex workers living with HIV were unaware of their status, compared to 6% of the general population.

A better understanding of human rights- and gender-related barriers for HIV testing is needed to improve service equity.

Methods: The Citizen Science project employs people living with HIV, young people, and key populations to monitor HIV services at 33 health facilities in Malawi (Dedza and Kasungu) and South Africa (West Rand).

Those accessing services at these sites is significant at the district level (95% Confidence Interval [CI]). For this sub-analysis, we conducted monthly clinic records surveys of HIV testing services and analyzed age-, sex- and population-disaggregated data for 75,062 tests conducted from January-October 2022.

Results: In West Rand, 67.4% of all people who tested for HIV in 2022 were young women aged 15-24 years (95% CI: 65.4-69.4), while 14.7% were young men (95% CI: 12.7-16.7). Young women have an HIV prevalence three times higher than their male peers (9.6% prevalence vs. 3.2%), yet they are 4.6 times more likely to test for HIV. We found a positive correlation between provider-initiated HIV testing and uptake among young men ($r = 0.36$, $p < 0.001$), potentially indicating a preference for this testing modality over others examined. In Dedza and Kasungu, COVID-19-related disruptions caused HIV testing to fall by 25.4% (99% CI: 23.4-27.4) among the general population compared with 79.5% (95% CI, 74.5-84.5) among sex workers.

Following the appointment of key populations focal points in health facilities and five sex workers as CLM data collectors, HIV testing increased. In 2022, 120 (95% CI: 114-126) sex workers tested quarterly compared to 36 (95% CI: 34-38) in 2019.

Conclusions: Community-led monitoring data can shed light on service inequalities and provide insight into mediating actions. Prioritisation of preferred testing modalities, population-specific services, and community leadership can help address stigma and reduce inequalities.

EP1082

Effectiveness of the community-facility linkages model in improving enrolment coverage of children and adolescents living with HIV into the OVC program in Mashonaland West province, Zimbabwe

L. Mukwekwezeke[1], H. Chazuka[1], R. Chanetsa[2]

[1]Hospice and Palliative Care Association of Zimbabwe, Monitoring Evaluation and Learning, Harare, Zimbabwe, [2]Hospice and Palliative Care Association of Zimbabwe, Clinic Linkages, Harare, Zimbabwe

Background: The participation of children and adolescents living with HIV (CALHIV) in Orphans and Vulnerable Children (OVC) programs is crucial for access to comprehensive HIV care and support services. However, OVC programs report relatively low enrolment coverage of CALHIV. Additionally, gaps exist in linking community-based and facility-based services.

To address these challenges, the Hospice and Palliative Care Association of Zimbabwe introduced the Community-Facility Linkages Model in Mashonaland West Province, Zimbabwe, in 2022. This model aimed to enhance enrollment coverage and strengthen service delivery.

Description: The model fosters collaboration between communities and health facilities to improve CALHIV enrollment in OVC programs and enhance service delivery. It involves seconding Lead Child Care Workers (LCCWs) to 143 health facilities across Chegutu, Makonde, Hurungwe, and Zvimba districts. These LCCWs operate at facilities three days weekly, serving as liaisons between communities and healthcare providers. Their responsibilities include line listing, offering, and recruiting CALHIV for OVC program participation, facilitating HIV treatment literacy, adherence support, viral load testing, and conducting monthly reviews of CALHIV enrolled on ART. LCCWs collect

and report data on CALHIV enrolled at facilities and their OVC program enrollment status using the program data collection tool monthly. This critical role ensures accurate tracking and reporting, enabling informed program planning and monitoring.

Lessons learned: The model achieved a steady increase in CALHIV enrollment coverage in the OVC program, rising from 84% in 2022 to 96% in 2024, surpassing the 90% Country Operational Plan (COP) target. By 2024, district-level enrollment coverage reached 99% in Chegutu, 97% in Makonde, 98% in Zvimba, and 97% in Hurungwe. Furthermore, 94% of facilities in Chegutu (33/35), 68% in Makonde (25/37), and 81% in Zvimba (29/36) achieved 100% coverage. The model facilitated effective tracking and follow-up of unenrolled CALHIV, closing gaps and consistently maintaining coverage above COP targets.

Conclusions/Next steps: The Community-Facility Linkages Model has proven effective in improving CALHIV enrollment coverage in the OVC program, consistently exceeding set targets.

This model demonstrates the significance of integrating community and facility efforts in the provision of HIV services and offers a scalable approach for improving CALHIV enrollment and retention in care programs.

EP1083

Under-reporting of TB-related mortality in Southern province, Zambia, 2023-2024

M. Mumba[1], L. Mwiinga[1], P. Kapompe[1], M. Tenforde[1], T. Lo[1], C. Banda[2], H. Phiri[2], S. Kunda[2], S. Dube[2]
[1]Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, Lusaka, Zambia, [2]Zambia Ministry of Health, Southern, Zambia

Background: Preventing, diagnosing, and treating HIV-associated tuberculosis (TB) is essential to reducing deaths among people living with HIV (PLHIV). Accurate measure of TB-related deaths is critical for informing programs. Given that 95% of TB related deaths are avoidable, the number of people who die from TB is an essential indicator of health system quality. We conducted a data quality assessment (DQA) of TB-related deaths reported in select facilities in Southern Province, Zambia.

Description: We created a line list, documenting mortalities from primary sources and through verbal autopsy between January 2023-March 2024 at 16 large hospitals in the Southern Province. We defined TB-related deaths as any death record with evidence of documented prior diagnosis (bacteriological/clinical) of TB from review of electronic health records, laboratory records, and paper-based registry sources. We then compared the recounts with the reports submitted to the Ministry of Health's District Health Information System 2 (DHIS2) to ascertain accuracy.

Lessons learned: A total of 7,090 deaths were enumerated compared to 5,439 deaths reported in DHIS2, showing 23% (1,651/7,090) under-reporting of deaths during the 15-month period; 601 were TB-related deaths, compared to 175 TB-related deaths reported in DHIS2 (71% [426/601] under-reporting TB-related deaths accounted for 8% (601/7,090) of all deaths compared to 3% (175/5,439) in DHIS2. The median age of death for TB-related deaths was 47 years. Of the TB-related deaths, 68% (410/601) were male and 32% (191/601) were female; 84% (507/601) had a known HIV status documented and 58% (290/507) had an HIV-positive status.

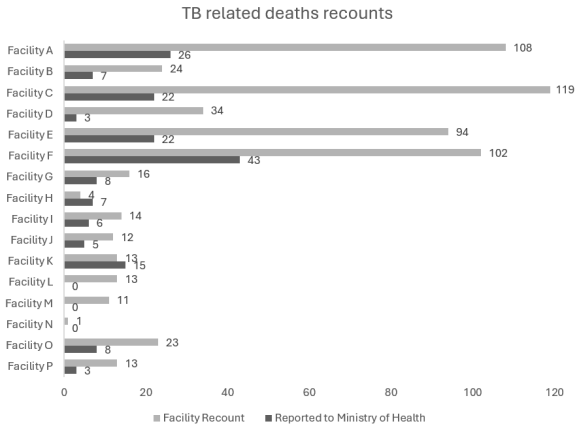


Figure 1. TB-related deaths in Southern Province, Zambia, 2023-2024.

Conclusions/Next steps: TB-related deaths among PLHIV were significantly under-reported, likely due to a variety of parallel systems and registers. Strengthening and streamlining reporting systems for TB from case notification, diagnosis, treatment, triangulation and supervision could preserve data quality for timely opportunities to reduce TB-associated mortality. Similar DQAs in other regions would be beneficial to ascertain country level data accuracy.

EP1084

Methodological triangulation in HIV research: effectiveness of community-led approaches in Nigeria

A. Ibrahim[1], O. Adebayo[2], C. Oga-Omenka[3], F. Medayese[1], O. Adeagbo[4], N. Ugbenyen[1], J. Atusue[1], E. Edegbe[1], U. Ugwoke[2], H. Bello Raji[2], M. Bathnna[2], E. Kwasi Armah-Ansah[3], A. Adekunle[2], T. Adetiba[2], E. Okpokoro[5], O. Olupitan[2], A. Agbaje[6], C. Mensah[7], P. Dakum[6], N. Workneh[8], J. Kimeu[8], K. Tsujii[8], J.-T. Nouboussi[8], M. Zamzu[8]

[1]Network of People Living With HIV/AIDS in Nigeria (NEPWHAN), Abuja, Nigeria, [2]Global Fund N-THRIP, Institute of Human Virology, Nigeria (IHVN), Abuja, Nigeria, Abuja, Nigeria, [3]School of Public Health Sciences University of Waterloo, Waterloo Ontario, Canada, Ontario, Canada, [4]College of Public Health, University of Iowa, Iowa USA, Iowa, United States, [5]International Research Centre of Excellence (IRCE), Institute of Human Virology Nigeria (IHVN), Abuja, Nigeria, Abuja, Nigeria, [6]Institute of Human Virology Nigeria (IHVN), Office of the CEO, Abuja, Nigeria., Abuja, Nigeria, [7]Institute of Human Virology Nigeria (IHVN), Office of the COO, Abuja, Nigeria, Abuja, Nigeria, [8]The Global Fund to Fight AIDS, Tuberculosis and Malaria, Global Health Campus, Geneva, Switzerland

Background: Research methods in HIV programs require robust approaches to capture both quantitative and qualitative insights. Within Nigeria's Global Fund-supported Nigeria-TB/HIV Reach Integration & Impact Project (N-THRIP) from January to June 2024, community-led monitoring (CLM) was used to address service delivery gaps.

This study assessed how mixed-methods triangulation has contributed to a comprehensive understanding of these gaps and informs policy and programmatic changes to improve health outcomes for People Living with HIV (PLHIV) and key populations (KP).

Methods: A triangulated mixed-methods approach comprising quantitative data collection through the Network of People Living With HIV/AIDS in Nigeria's Community iMonitor application and qualitative data from 91 focus group discussions sessions across the 13 states from January to June 2024. Quantitative data from 17,657 self-reported cases were analyzed using descriptive statistics, while thematic analysis of qualitative data provided insights into lived experiences related to service accessibility, stigma, and care quality from PLHIV, KPs and priority groups.

Results: Methodological triangulation revealed critical gaps in service delivery, such as frequent drug stockouts, breaches in confidentiality, and prolonged waiting times. Quantitative findings indicated a 12% improvement in client retention rates, while qualitative insights identified stigma and discrimination as persistent barriers to service uptake, particularly among the key population.

This allowed for clearer understanding of numerical trends and human experiences, supporting targeted interventions. This triangulated approach informed programmatic changes, including the proposed institutionalizing of periodic confidentiality retraining for healthcare professionals, scaling up stigma-reduction interventions, improving access to care through community-driven solutions and the quest to improve supply chain management for HIV and TB medications.

Conclusions: The application of methodological triangulation has provided a holistic understanding of service delivery challenges and effectiveness of community-led approaches. This comprehensive evaluation approach can serve as a model for future HIV and TB programs, enhancing the depth and applicability of research findings.

EP1085

Improving use of UgandaEMR to accelerate HIV care through a leadership and mentorship model in the nine districts of Bunyoro Region, Uganda from October 2020 to June 2024

P. Kiiza[1], P. Nagiisi Mudoma[1], K. Onekalit[1], R. Oceng[1], E. Tumwine[1], S.A. Ssebulime[2], A. Kavuma[2], A. Mucunguzi[2], D. Damba[1], R. Jjuko K[1], A. Ndawula[1], C. Epidu[2], B. Nsangi[1], P. N. Nahirya[3], A. Maganda[1], K. Musenge[4], E. Sande[4], D. Kiragga[5]

[1]Baylor College of Medicine Children Foundation Uganda, Strategic Development, Monitoring, and Evaluation, Kampala, Uganda, [2]Baylor College of Medicine Children Foundation Uganda, Medical Programs, Kampala, Uganda, [3]Baylor College of Medicine Children Foundation Uganda, Research, Kampala, Uganda, [4]Centres for Disease Control and Prevention, Division of Global HIV & TB, Kamapala, Uganda, [5]Baylor College of Medicine Children Foundation Uganda, Executive Office, Kampala, Uganda

Background: UgandaEMR is an advanced electronic medical record (EMR) system designed to streamline collection, collation, aggregation, and reporting of patient outcomes within healthcare facilities (HFs). It is built on the OpenMRS platform and customized to track the needs of healthcare providers in resource-constrained settings. In 2020, the coverage and functionality of UgandaEMR in nine districts of Bunyoro were 50% (73/145) and 41% (30/73) respectively.

A root cause analysis revealed infrastructural gaps, inadequate data personnel at some facilities, and capacity gaps among Health Information assistants (HIAs). Thus, we describe the process taken to improve coverage and functionality of the UgandaEMR in Bunyoro.

Description: CDC through Baylor Foundation Uganda, supported acquisition of computers, tablets, Networking equipment, and biometric scanners, to 145 facilities. A total of 102 data and medical records assistants (HRH) were recruited and attached to high-volume facilities. Working with the DHOs, Biostatisticians, facility in-charges, clinicians, HIAs, and HRH staff were mobilized for comprehensive on-site mentorships at the (114/145) health facilities to enhance their data management skills. Hands-on refresher skills training on data entry and backlog clearance, cleaning, and extraction of patient-level extracts and audit tools were done.

Following the mentorship and skills training, facility teams were assigned daily targets for backlog data entry into the UgandaEMR. Weekly progress reports for extracted

data addressed data calls to districts, MOH, and Donors. The cluster teams leveraged WhatsApp group platforms to track progress of UgandaEMR functionalization.
Lessons learned: Coverage and functionality of the UgandaEMR improved from 50% in 2020 to 79% (114/145) and from 41% to 96% (110/114) respectively by June 2024. SMS client appointment messages were sent to 61,510 clients, and mortality surveillance done to 534 deaths. The turnaround time for managing data calls improved from 5 days to less than 24 hours, hence real-time generation of extracts and client-centered audit tools to guide client-centered care. This has strengthened patient-level service delivery and reporting outcomes at the HIV clinics.
Conclusions/Next steps: Comprehensive on-site mentorship focused on skills building, leadership engagement, and budgeting for UgandaEMR activities at districts will improve the sustainability of digital-health information and accelerate person-centered care.

EP1086

Improving real-time reporting in the Electronic Case-Based TB Surveillance System at 155 health facilities in Bugisu and Bukedi regions using a quality improvement approach

D. Cherotin[1], C. Joshua Brianwong[1], R. Jjuuko[1], P. Ntege Nahirya[1], E. Okwir[1], F. Nghania[1], S. Lwanga Zimwanguyizza[1], A. Mugume[1], D. Kiragga[1]
[1]Baylor Foundation Uganda, Kampala, Uganda

Background: In 2020, the Ugandan Ministry of Health, using partner support, developed an Electronic Case-Based TB Surveillance System (eCBSS) to monitor patient management, reporting, and surveillance of TB and Leprosy across all levels of service delivery. By December 2023, eCBSS had been scaled up to 155 Bugisu/Bukedi region health facilities. However, only 23% of the trained facilities reported TB cases into eCBSS in real-time. The team implemented quality improvement (QI) strategies to improve real-time eCBSS reporting at the 155 Diagnostic and Treatment Units (DTUs) in the Bugisu/Bukedi sub-regions.
Description: A root cause analysis conducted in January 2024 identified several challenges, including undefined roles for data teams in supporting daily TB data entries, insufficient data bundles, limited data triangulation with the weekly HMIS 033b surveillance report, and back-log of TB patients' data. The strategies implemented to address these issues included:

- Revising and defining data team roles to include targets for daily data entry.
- Providing each DTU with 7.5GB of internet data bundles to facilitate daily data entry.
- Developing a phone and email directory of trained personnel.
- Initiating weekly reminders through online platforms such as SMS One, email, and WhatsApp.
- Orienting and assigning 2 eCBSS mentors per district to support weekly follow-up and data triangulation.
- Co-opting additional human resources to support backlog entry in DTUs with high TB cases at the district health office.

Lessons learned: By December 2024, reporting in the weekly HMIS 033b surveillance report to the eCBSS in real-time had improved from 23% to 98%. This integration significantly enhanced the eCBSS's sensitivity in notifying drug-susceptible TB patients, with a total of 1,124 TB patients notified in real-time including persons living with HIV. Over time, it has enhanced the management of individuals living with HIV and TB co-infection by improving drug refill monitoring and treatment success rate from 88% in January 2024 to 93% in December 2024.
Conclusions/Next steps: Implementing QI strategies significantly improved real-time reporting in the eCBSS in the Bugisu and Bukedi regions. This has led to better decision-making and more effective tuberculosis and HIV control efforts in these areas.

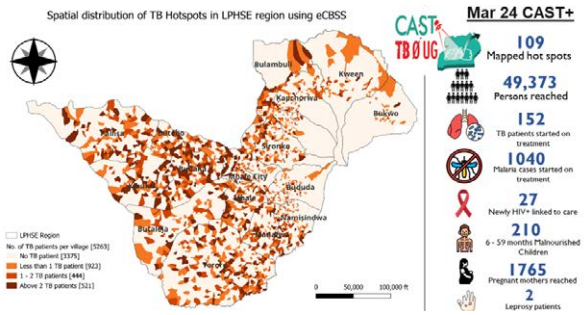
EP1087

Leveraging eCBSS data for geospatial mapping of tuberculosis hotspots and optimizing the integrated TB case finding (CAST+) intervention in Eastern Uganda

J. Clark Brianwong[1], D. Cherotin[1], L. Ssekiswa Z.[1], J. Bakyawa[1], E. Okwir[1], F. Nghania[1], R. Jjuuko[1], P. Nahirya[1], A. Mugume[1], D. Kiragga[1]
[1]Baylor Foundation Uganda, Kampala, Uganda

Background: The Ugandan Ministry of Health developed the CAST+ strategy to find missing TB patients through 5-day biannual door to door community screening for TB, leprosy, HIV, malaria, malnutrition, antenatal care and immunization status. The first nationwide campaign was conducted September 2022, covering all villages. However, this intervention has proven costly with variable results. In 2020, Uganda adopted the electronic case-based surveillance system (eCBSS) for TB surveillance and program reporting that provides patient level data and place of residence. We describe how eCBSS data was used to develop geospatial maps to define TB hotspots for targeted CAST + Campaigns.
Methods: Prior to the CAST+ campaign in March 2024, USAID LPHS-E scaled up eCBSS to 93% (166 out of 178) of the Diagnostic and Treatment Units (DTUs) in the Bukedi and Bugisu regions and supported entry to 103% (6992 out of 6860) of the patient backlog. This data was then used to map TB hotspots using Geographic Information System technology, which were prioritized and actively screened during the CAST+ campaign in March 2024. A hotspot was defined as any village with more than two TB patients in the past year (March 2023 to February 2024).
Results:

- There was a 41% drop in unit cost of identifying a TB patient from $66 in September 2022 to $37 in March 2024.
- The March 2024 campaign cost $5,783, a significant reduction from the $50,678 spent in the September 2022 campaign.
- During the March 2024 CAST+ campaign, 155 TB patient from the 109 mapped hotspots were diagnosed and started on treatment, compared to 764 TB patients identified in all villages in Sept 2022 with similar yield of 2.0% and 1.9% respectively.



Conclusions: Utilizing eCBSS data for geospatial mapping enables TB programs to accurately identify hotspots, pinpoint high-burden areas, and effectively guide resource allocation for targeted community TB interventions.

EP1088

Evaluating the impact of gamified Monitoring & Evaluation training on knowledge retention among community-based organizations

N. Tshuma[1], T.M. Ndhlovu[1], M. Malahlela[1]
[1]Best Health Solutions, Public Health, Johannesburg, South Africa

Background: Community-based organizations (CBOs) often encounter significant barriers in adopting robust Monitoring & Evaluation frameworks due to limited technical capacity and resource constraints. These challenges impede data-driven decision-making and program optimization in health service delivery.

This study aimed to assess the impact and acceptability of a gamified M&E training intervention designed to enhance knowledge retention, skills application, and confidence among CBO personnel. The intervention was implemented to evaluate differential outcomes and scalability.

Description: The intervention was conducted over six months in 13 community sites across Gauteng province, targeting CBO staff engaged in HIV, TB, and STI programs. The training utilized gamification principles to simplify M&E concepts, incorporating interactive simulations, role-playing, and competitive challenges. Key M&E competencies covered included indicator selection, data flow management, and reporting frameworks.

Pre and post-training assessments were conducted across age groups (18-29, 30-39, 40-50) to measure improvements in knowledge retention and skills application. Data were analyzed using paired t-tests and logistic regression models to determine the intervention's effectiveness.

Lessons learned: Statistical analysis revealed a significant improvement in M&E knowledge retention across all age groups. Post-training assessment scores improved by an average of 48% ($p<0.001$), with the highest gains observed in the 30-39 age group (OR=2.3, 95% CI: 1.8-2.9) compared to the baseline. The odds of achieving high competency levels post-training were 3.1 times greater among participants aged 40-50 (OR=3.1, 95% CI: 2.4-4.0), indicating a strong association between age and knowledge uptake. Engagement levels, measured through training participation rates and qualitative feedback, showed a 76% satisfaction rate, with 82% of participants reporting increased confidence in applying M&E concepts. Common challenges included difficulties in translating theoretical concepts into practice, particularly among younger participants (OR=0.8, 95% CI: 0.6-1.1).

Conclusions/Next steps: The gamified approach to M&E training demonstrated significant improvements in knowledge retention and practical application across diverse CBO settings. These findings underscore the potential of gamification in enhancing technical capacity-building initiatives.

Future recommendations include refining the intervention by integrating adaptive learning modules and real-time data analysis tools to sustain long-term engagement and application. Scaling the intervention nationally could further strengthen CBOs' capacity for data-driven decision-making, ultimately improving health service delivery outcomes.

EP1089

Utilizing simple clinical decision support system to improve viremia management interventions in people living with HIV on antiretroviral therapy in a high-volume facility in Kenya

K. Mutai[1], R. Kamau[1], E. Mundia[1], S. Wahome[1]
[1]Kenyatta National Hospital, Nairobi, Kenya

Background: Implementation programs have focused resources to meet the UNAIDS goal of achieving 95% HIV viral suppression among people living with HIV (PLHIV) on antiretroviral therapy. HIV guidelines in Kenya stipulate that PLHIV with high viremia undergo three sessions of intensive adherence counselling to address treatment barriers.

Tracking the intervetions in a high-volume facility is challenging resulting in missed opportunities. We enhanced a viremia management monitoring tool with clinical decision support system (CDSS) features and evaluated its effectiveness in enabling timely interventions.

Methods: This involved high viremia clients being followed up in Kenyatta National Hospital, a national referral hospital in Kenya between Oct 2022 to Sep 2024. The standard manual viremia management register was designed as a sharable Google sheet tool for multiple adherence counsellors.

The enhanced register was implemented in Jan 2024 as a longitudinal version with the capability of documenting multiple viral loads over the follow-up period. CDSS features were incorporated to enable alerts by automatically highlighting records with unique colours based on the due dates for specific interventions.

The main outcome was the duration taken to initiate and complete interventions presented in median days. A comparison of median durations between standard (pre-Jan 2024) and the enhanced (post-Jan 2024) tools was done using Mann Whitney U test.

Results: Out of the 753 high viral loads documented in the period, more than two-thirds (68.3%) were >1000 copies per mL. Those managed using the enhanced register

were 395 (52.5%) while the comparison group was 358 (47.5%). The median duration to initiation of interventions was significantly shorter, 39 days (IQR 28-62 days), after the introduction of the enhanced register compared to 56 days (35-91 days) in the previous period (p<0.001). The overall duration taken to completion of intensive adherence counselling sessions improved significantly to a median of 109 days (IQR 69-154 days) compared to a previous delay of up to 149.5 days (IQR 111-186 days), p<0.001.

Conclusions: Digital solutions are essential in tracking high viremia clients in high-volume settings due to the intensity and multiplicity of interventions. Simple CDSS features incorporated into open-source tools enhance the efficiency of services with little demand for resources.

EP1090

HIV vaccine trial experiences: lessons for upcoming HIV, gonorrhea and chlamydia vaccine research

W. Dunda[1], G. Kuffour[2], A. Bula[1], M.C. Hosseinipour[3], M. Matoga[4]
[1]UNC Project Malawi, Qualitative, Lilongwe, Malawi, [2]Howard University College of Medicine, Washington DC, United States, [3]University of North Carolina at Chapel Hill, Division of Infectious Diseases, School of Medicine, North Carolina, United States, [4]UNC Project Malawi, Sexually Transmitted Infections, Lilongwe, Malawi

Background: Vaccine hesitancy remains a significant barrier to global vaccine trial participation and acceptance, potentially worsened by failed trials. Following an unsuccessful HIV vaccine trial and hesitancy towards COVID-19 and Cholera vaccine campaigns in Malawi, it is unclear if Malawian communities would participate in future vaccine trials or campaigns for upcoming HIV, gonorrhea, and chlamydia vaccines.

This study aims to understand the perceptions, experiences, barriers, and facilitators influencing vaccine uptake and trial participation for upcoming STI vaccines among women who participated in the HIV vaccine trial, as well as the cholera and COVID-19 vaccine campaigns in Lilongwe, Malawi.

Methods: Using purposive sampling, we recruited 28 women for in-depth interviews, divided into four groups: those who received both COVID-19 and Cholera vaccines, those who declined both vaccines, those who received the Cholera vaccine but declined the COVID-19 vaccine, and those who received the COVID-19 vaccine but declined the Cholera vaccine. Interviews were conducted in Chichewa, audio-recorded, transcribed, and translated into English. Data was coded using NVivo 14 and analyzed using thematic analysis.

Results: Women who accepted both vaccines did so for self-protection. However, some women took the COVID-19 vaccine under duress, in order to function as citizens when a COVID-19 vaccine certificate was required. Those who declined the vaccines cited community misconceptions, such as the belief that vaccines are linked to satanism, that people get sicker after receiving the vaccine, that the vaccine causes infertility, and that there are government depopulation efforts.

In addition to these misconceptions, the lack of information about the level and duration of efficacy of different vaccines posed a significant barrier. For instance, some participants refused vaccination because they believed people could still get infected or die despite being vaccinated.

However, most women indicated that they would have no problem participating in vaccine trials if they were properly informed, as this would allow them to contribute to society.

Conclusions: Major barriers to vaccine acceptance in Malawi include misconceptions, lack of accurate efficacy information, and low risk perception. Increasing vaccine awareness is crucial for improving acceptance, with many women likely to participate in HIV/STI vaccine trials due to high-risk perception.

EP1091

Efficiency of the electronic data management system in HIV prevention intervention: lessons from the e-first platform in selected districts of Zimbabwe, 2024

E. Mugariri[1], T. Masoka[1], H. Mafaune[1], D. Dhakwa[2], K. Yogo[2], F. Mudokwani[2], F. Mudzengerere[3], E. Tachiwenyika[3], T. Tapfuma[2], T. Bhatasara[4], B. Madzima[5], B. Nyamwanza[5], R. Yekeye[6], M. Mutseta[7]
[1]Zimbabwe Health Interventions, Strategic Information, Harare, Zimbabwe, [2]Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, [3]Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, [4]USAID, Programs, Harare, Zimbabwe, [5]National AIDS Council, Programs, Harare, Zimbabwe, [6]National AIDS Council, Operations, Harare, Zimbabwe, [7]Ministry Of Health and Child Care, DREAMS, Harare, Zimbabwe

Background: The Determined, Resilient, Empowered, AIDS-free, Mentored and Safe (DREAMS) HIV prevention program is a fully community-based intervention with ample obligations aimed at reducing HIV among adolescent girls and young women (AGYW) The program puts great value to a functional Monitoring and Evaluation system to enable the organization track, collect, and report high-quality data. The Zimbabwe Health Interventions(ZHI) DREAMS program transitioned from paper based to android based data entry to strengthen the efficiency of data management by going e-first on the screening and enrolment tools that are used to identify and enrol girls into the program.

Description: E-first utilises the android version of the online database DHIS repository. The Community Program Facilitators mobilise and enrol girls at point of data generation in the community. The e-first improves accuracy and reduces the turn-around time for data collection and reporting.

We assessed 65535 (paper-based) AGYW aged 10-24 years enrolled into the DREAMS program between October 2023 and September 2024 and those enrolled between December 2024 and January 2025 (6628efirst) from 11 DREAMS districts under ZHI in Zimbabwe. E-first was introduced

November 2024. Comparison of turnaround time was conducted using SPSS generating descriptive statistics for the 2 periods. This assessment was covered by Medical Research Council of Zimbabwe approved non-research determination protocol (MRCZ/E/216).

Lessons learned: The mean turnaround time for the paper based system was 28 days whilst that for the android version went down to 5 days in cases where data syncing was delayed. This shows a 23-day reduction in time taken between data generation and when it can be utilised. The android version proved to have a statistically significant high efficiency in terms of turnaround time (p=<0.001).

A cost reduction of 82 cents per individual screened & enrolled on paper-based system was realised in terms of cost of paper tools and centralised data entry.

Conclusions/Next steps: The Android data management system is 5 times more efficient than the paper based method. It also saves on scarce resources that can be channelled to reach out to more girls or provide more interventions. We recommend the scale up of e-first data management processes and gradual phase out of the paper-based system.

EP1092

Optimizing HIV testing data reported through Ukraine's Information System for Monitoring Socially Important Diseases (IS MSSD) to facilitate enhanced data use for decision making

S. Leontieva[1], N. Roman[1], T. Gaborets[1], K. Gamazina[1], O. Kurdus[1], O. Gvozdetska[2], L. Hetman[3]

[1]PATH Ukraine Country Program, Kyiv, Ukraine, [2]Center of Public Health of the Ministry of Health of Ukraine, Kyiv, Ukraine, [3]Center of Public Health of the Ministry of Health of Ukraine, HIV Management and Response Department, Kyiv, Ukraine

Background: Health information systems are crucial for data-driven clinical care. Ukraine's national HIV testing module, embedded in IS MSSD, lacked the functionality to allow health care providers (HCPs) to access, enter, and/or analyze regional and national-level HIV testing data disaggregated by sex, age, testing modalities, results, population groups, and health care facilities (HCFs).

The USAID PATH-led REACH 95 project worked with the MOH's Center of Public Health (CPH) to update the HIV testing module to enable greater data use by HCFs to optimize HIV testing efforts.

Description: REACH 95 advocated nationally for IS MSSD improvements in September 2023. The project supported identification of required changes to align reporting with international recommendations and include missing disaggregations:

1. Fields to report data by HIV testing modalities, key populations, and facilities;
2. Age and sex disaggregations to the index testing cascade.

To strengthen HCP capacity to use IS MSSD, REACH 95 developed detailed instructions and trainings for 619 HCPs across 238 HCFs on entering and using data in the updated HIV testing module for analysis and programmatic decision making. 92% of the project-supported HCFs (247 out of 268) and 715 users gained access to the HIV testing module.

Lessons learned: By December 2024, HCPs at 233 HCFs entered 84,051 HIV results into the HIV testing module, including 2,628 HIV-positive results. Implementation challenges--including lack of HCP motivation for data entry, war-related electricity and Internet shortages, lack of computer equipment, and training needs—led to incomplete/low-quality data being entered into the system. Managers now use data in IS MSSD to make management decisions to improve effectiveness of HIV testing initiative, e.g., analyzing the testing data in IS MSSD, managers realized that in 122 out of 247 HCFs need to increase HIV testing quality and coverage through HCPs training and quality control programs.

Conclusions/Next steps: REACH 95-supported enhancements to the IS MSSD testing module led to the creation of a unique HIV testing database specifying all testing results allowing to use data at the regional and national level for improved decision making. The project will continue supporting HCFs on data completeness and quality, analysis, and advocacy to increase system access.

EP1093

Revolutionizing client feedback to improve HIV care retention: insights from SatisfApp implementation in Haiti

M.A. Bien Aime[1], B. Shaw[2], N.R. Labbe[1]

[1]Georgetown University, Center for Global Health Practice and Impact, Port au Prince, Haiti, [2]Georgetown University, Center for Global Health Practice and Impact, Washington, United States

Background: Dissatisfaction with healthcare services is a primary reason for interruptions in HIV treatment in Haiti. Addressing client satisfaction became crucial for improving retention in care, requiring significant reforms to the existing client satisfaction system. Traditionally, complaints were conveyed via suggestion boxes, leading to disengagement from care.

To ensure consistency and standardization across all departments, the program introduced SatisfApp, a user-friendly survey tool for clients to share their opinions and experiences anonymously.

Description: SatisfApp, an electronic questionnaire launched in 2021 by TIDE-Haiti, a PEPFAR-funded initiative, is an electronic questionnaire designed to improve HIV care retention, developed through extensive consultations with stakeholders, including clients, authorities, and healthcare professionals.

The questionnaire was developed through focus group discussions to understand interruptions in HIV treatment and refined using feedback from clients, associations, and specialists. It includes open-ended comment boxes, multiple-choice questions, and 5-point Likert scale questions with smiley face icons for improved comprehension to improve comprehension based on user feedback. After piloting with four PLHIV associations and three CSOs, adjustments were made to refine the tool. The SatisfApp

is currently is accessible via the National Federation of PLHIV Associations' website, QR codes on promotional flyers, and links shared in PLHIV chat groups, enabling effective client feedback on welcoming, staff services, waiting times, and stigma.

Lessons learned: Initial participation in SatisfApp was limited due to clients' fear of retaliation. However, after assurances of anonymity, engagement increased significantly. By January 2023, 8,247 forms had been completed by PLHIV from 112 facilities nationwide.

Key findings highlighted issues such as perceived stigma, long waiting times, and poor sanitation as major barriers to retention. In response, PEARS conducted visits to facilities and held discussions with implementing partners, resulting in actions like staff training, developing a stigma and discrimination curriculum, and promoting differentiated service delivery models.

Conclusions/Next steps: The adoption of SatisfApp has provided critical insights into factors affecting retention in HIV care, emphasizing the importance of client satisfaction. Continued use of tools like SatisfApp can drive improvements in service quality and retention. This approach holds potential for expansion across Haiti's broader healthcare system, fostering person-centered care nationwide.

EP1094

Digital assistance tools improves timely access to tuberculosis preventive therapy: a retrospective cohort study in southern Nigeria

U. Akpan[1], E. Nwanja[1], M. Umunike[1], O. Esosuakpo[1], O. Ogheneuzuazo[1], C. Okolo[1], U. Omo-Emmanuel[2], R. Eneogu[2], D. Kimanga[2], M. Katbi[2], D. Ogundehin[2], C. Obiora-Okafo[2], A. Idemudia[2], B. Adebobola[3], E. James[2], J. Pius[2], O. Oyelaran[2], O. Onyedinachi[1], A. Adegboye[2], A. Eyo[1]

[1]Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, [2]Office of HIV and TB, United States Agency for International Development, Abuja, Nigeria, [3]National AIDS, STI and Viral Hepatitis Control Program, Abuja, Nigeria

Background: In January 2023, the Accelerating Control of Epidemic (ACE5) project, with funding from PEPFAR/USAID developed a digital assistance tool (DAT) to serve as a TPT initiation reminder system for health care worker.

This study examines the time to TPT initiation after the introduction of the tool.

Methods: This retrospective cohort study included PLHIV who did not receive TPT at ART initiation due to delays for TB testing, across 225 health facilities in Akwa Ibom and Cross River States, Nigeria. DAT was designed to pull aggregate data from DHIS2 at scheduled intervals.

This data was linked to Power BI using direct API (Application Programming Interface) connections. Healthcare providers used the tool to visualise TPT initiation gaps arising from a confirmed negative TB test real-time, triggering a tracking process to provide TPT to the client.

Data on ART initiation dates and TPT initiation dates were collected over 12 months before (January-December 2022), and (July 2023 to June 2024) after the roll-out of the tool. Only PLHIV on ART until June 2024 were included. Time to TPT initiation (weeks between ART initiation and TPT initiation) was analysed by site type (TB diagnostic hub or non-TB diagnostic hub), age group (children 0-14years, or adult), and client residence. All data were analysed using STATA 14.

Results: A total of 8,975 and 9,300 PLHIV initiated ART pre- and post-digital tool roll-out respectively, with 37.3% (3351/8975) and 16.0% (1486/9300) PLHIV not receiving TPT at ART initiation respectively. Within the 12 months follow-up, TPT initiation among those who missed TPT was 88.6% (2969/3396) and 68.3% (1015/1496) pre- and post-digital tool roll-out respectively. The mean time to TPT initiation was 5 weeks (SD±10.2) pre-roll-out and 2 weeks (SD±6.4) post-roll-out (p<0.001). Mean time to TPT initiation reduced significantly by 4 weeks among children (7 weeks vs 3 weeks) compared to 3weeks among adults (p<0.001).

PLHIV Characteristics	Child	Adult	Initiated ART at TB diagnostic hub	Initiated ART at Non-TB diagnostic hub	Resident in same Local Government as health facility	Resident in different Local Government from health facility
Time to TPT initiation (Pre-intervention)	7 weeks (SD:±14)	5weeks (SD:±10)	8 weeks (SD=±12	5 weeks (SD:±10)	5weeks (SD:±10)	5weeks (SD:±11)
Time to TPT initiation (Post-intervention	3weeks (SD:±8)	2 weeks (SD:±6)	2 weeks (SD:±7)	2 weeks (SD:±6)	2weeks (SD:±6)	2 weeks (SD:±7)

Conclusions: The use of a digital assistants showed that while reducing TPT initiation time improves efficiency, identification gaps may remain. Closing linkage gaps in treatment programs should adopt a multifaceted approach and interventions adjusted dynamically.

EP1095

Driving sustainability through integration: Nigeria's experience from integrating pre-exposure prophylaxis monitoring and supportive supervision

O. Sowale[1], N. Otubu[1], O. Abudiore[1], I. George[1], U. Amalu[1], O. Olumilua[1], D. Resar[2], A. Mwamelo[2], P. Mohammed[3], C. Okorie[3], T. Olakunle[3], I. Dada John[3], O. Fasawe[1]

[1]Clinton Health Access Initiative, Abuja, Nigeria, [2]Clinton Health Access Initiative, HIV Prevention, Boston, United States, [3]National AIDS, Viral Hepatitis and STI Control Programme, Abuja, Nigeria

Background: Pre-exposure prophylaxis (PrEP) service delivery in Nigeria began in 2017, targeting key populations and serodiscordant couples, as part of a package of prevention interventions, to reduce the risk of HIV transmission. Monitoring these services is crucial to support evidence-based decision-making and program management; however, quality monitoring mechanisms have historically been siloed by intervention and limited geographically due to funding constraints.

With increasingly constrained HIV budgets, establishing efficient, integrated program management mechanisms is essential for ensuring effective program stewardship,

sustainability, and high-quality services for clients. This paper examines the lessons from integrating PrEP service quality monitoring into the biannual integrated supportive supervisory visits (iMSV) coordinated by the national program.

Description: In March 2024, Government and partners in the HIV program reviewed the electronic iMSV tool to include new indicators for PrEP including knowledge of healthcare workers (HCWs), availability of data collection tools. The iMSV teams were constituted and trained to administer the updated tool and mentor HCWs on PrEP services. The revised tool was administered to HCWs across selected facilities during the two cycles of the iMSVs conducted in 2024.

Lessons learned: The PrEP-specific monitoring and supportive visits covered only 17 sites across three states in the fourth quarter of 2023, which represents 1% of facilities offering PrEP services. In cycle one of the iMSV, 121 facilities across 16 states were visited, while in cycle two, 290 facilities across 36 + 1 states were assessed. This represents 30% of the facilities providing PrEP services nationwide. Key gaps identified include sub-optimal knowledge of PrEP interventions among approximately 50% of HCWs.

To address this gap, on-the-job mentoring was provided, equipping HCWs with the necessary knowledge and skills to deliver comprehensive PrEP services. Similarly, 20% of facilities lacked documentation tools for PrEP service delivery, and this was escalated for action.

Conclusions/Next steps: Integration of PrEP indicators into the iMSV process increased the facility coverage and impact of PrEP monitoring, and enabled large-scale troubleshooting of service delivery gaps, supporting quality improvement and strengthening HCWs' capacity compared to previous siloed approaches. This integrated approach represents an effective model for ensuring quality monitoring across diverse settings.

EP1096

VIP card: A smartcard solution for enhancing HIV care access and continuity for mobile populations in Haiti

E. Emmanuel[1], D. Lauture[1], J.W. Domerçant[1]
[1]Institut pour la Santé, la Population et le Développement (ISPD), Pétion-Ville, Haiti

Background: Internal migration poses significant challenges to the continuity of HIV care, particularly in settings affected by instability and displacement. In Haiti, internal displacement due to gang violence has led to widespread disruptions in healthcare services.

The USAID-funded BRIDGE project, implemented by ISPD, aims to improve access to and continuity of HIV care for mobile populations.

Description: To address the challenges of maintaining uninterrupted HIV care for mobile populations, BRIDGE developed and implemented a novel approach utilizing a smartcard system. This innovative solution facilitates the seamless transfer of medical information across healthcare facilities, enabling continuity of care for individuals who may need to access services at different locations.

In collaboration with Solutions, ISPD developed a secure and user-friendly smartcard platform in December 2020. This platform allows healthcare providers to access and securely share critical clinical information, including treatment history, laboratory results, and medication regimens, across participating healthcare facilities. The platform offers several key functionalities like access to a consolidated medical file with data from previous visits across participating sites; real-time data entry and sharing for medication refills, laboratory assessments, and clinical consultations; automated alerts to the client's primary care provider at their original site of care to update their medical records.

The system is available through both web-based and mobile platforms for easy access and data entry. A toll-free number is available to assist mobile populations in locating nearby healthcare facilities equipped with the smartcard system.

Lessons learned: As of December 2024, 52 healthcare sites have implemented the smartcard system, with 7,676 clients registered (4683 females and 2969 males) and 790 cross-site service deliveries documented. These services include 353 laboratory assessments, 337 medication renewals, and 100 medical consultations.

The smartcard system has proven effective in facilitating continuity of care for traveling and displaced clients, reducing wait times, and streamlining the client registration process.

Conclusions/Next steps: The smartcard system has been expanded to support the continuity of care for pregnant women seeking labor/delivery services after receiving prenatal care at different facilities. Ongoing efforts are underway to explore the potential for binational use of the smartcard system for Haitian migrants accessing healthcare services in the Dominican Republic.

EP1097

Using eLABS, a digital health mobile application implemented to strengthen the clinic-laboratory interface by monitoring the sample value chain and improve HIV viral load suppression rates in Zambia in 2023

K. Chigudu[1], M. Mweemba[2], N. Mwansa[2], P. Choonga[3], T. Machila[3], S. Kanyika[4], C. Kakombo[5], N. Ntlangeni[1], A. Mudau[1], M. Marumule[1], V. Thipe[1], B. Gorogodo[1], L. Stewart-Isherwood[1], W.S. Stevens[1]
[1]Wits Diagnostic Innovation Hub, Johannesburg, South Africa, [2]Ministry of Health, Lusaka, Zambia, [3]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [4]Right to Care Zambia, Lusaka, Zambia, [5]Private Agencies Cooperating Together, Lusaka, Zambia

Background: eLABS, a digital health mobile application aimed at strengthening the clinic-laboratory interface was implemented in 9/10 provinces in Zambia. The application had a phased implementation from 2017 in 1287 PEPFAR-supported facilities for HIV viral load (VL) testing. Its main purpose is to monitor the entire sample value chain and enhance access to laboratory results and improve client care by means of alerting healthcare workers

(HCWs) of critical results allowing for faster action. The objective of this study was to assess the impact of implementing eLABS on HIV viral load suppression and results turn around times (TAT) in Zambia by analysing data from eLABS facilities and non-eLABS facilities.

Methods: HIVVL turn around times (TAT) and VL suppression (<1000cp/ml) data were collected for analysis for the period January-December 2023. The data set was obtained from eLABS digital health system and DisaLAB laboratory information system (LIS) and distinguished as data for eLABS facilities (n=1287) and non-eLABS facilities (n=1141).

To have the same comparison, TAT was calculated based on sample collection time to sample tested time for both eLABS and non-eLABS records. A paired sample t-test was performed on the mean TAT and VL suppression rates for eLABS and non-eLABS facilities.

Results: HIVVL test volumes for eLABS and non eLABS facilities for the analysis period were 499,172 and 549,403, respectively. Mean VL suppression rates for eLABS facilities (91.13%) were significantly higher than non-eLABS facilities (86,85%) ($p<0.001$ at $\alpha = 0.05$). However, there was no significant difference between mean TAT for eLABS facilities (5,24 days) and for non-eLABS facilities (7,91 days).

Conclusions: The findings demonstrate the positive impact of implementing eLABS on HIV program performance. Visibility of the entire sample value chain through eLABS enables near real-time monitoring of diagnostic processes and allows for immediate interventions for improved client management. Whilst HIVVL suppression has a direct correlation with client antiretroviral therapy adherence; the use eLABS which includes acknowledgement of unsuppressed test results by HCWs, were associated with higher VL suppression rates in facilities utilizing this tool.

EP1098

Using machine learning and geospatial clustering to identify hotspots for targeted HIV testing and prevention services in Kenya

K. Muthoka[1], G. Onzere[1], L. Nyaga[2], J. Mwangi[3], J. Njenga[3], J. Muthusi[3], S. Jonnalagadda[3]

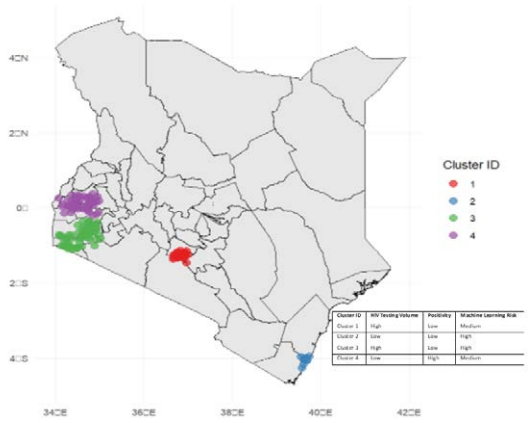
[1]Palladium Kenya, Strategic Information, Nairobi, Kenya, [2]National AIDS and STI Control Programme (NASCOP), Ministry of Health (MOH), Strategic Information, Nairobi, Kenya, [3]U.S. Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV and TB, Nairobi, Kenya

Background: Kenya is nearing HIV epidemic control. As such, traditional hotspot identification methods based on aggregate data can overlook facility-level nuances. A case surveillance approach is therefore necessary for identifying gaps in the HIV response for targeted resource allocation and interventions. We leveraged machine learning (ML) model predictions and routine case-level data to identify precise geographic hotspots and map clusters of HIV acquisition. Outputs were presented in epidemic intelligence maps to inform tailored public health interventions.

Methods: We analyzed 206,992 case-level data from 1,480 facilities in Kenya's national data warehouse for July 2024, with ML-predicted HIV risk category (very high to low) derived from clients' demographic and behavioral characteristics and facility's catchment population's risk profiles. Clustering was performed using Density-Based Spatial Clustering of Applications with Noise (DBSCAN) algorithm, creating composite scores weighted by ML-predicted HIV risk categories, number tested, number positive, and positivity rates. Clustering was based on 20 kilometers maximum radius and minimum five facilities. Using percentiles, composite risk scores were stratified into low (<25th), medium (25th–75th) and high (>75th) categories. High-risk clusters were identified as hotspots.

Results: Four types of hotspots with the following characteristics were identified:

1. Thirty-four facilities with 1.9% positivity from 11,893 HIV tests and moderate ML-predicted risk;
2. Ten facilities with 2.4% positivity from 1,732 HIV test and high ML-predicted risk;
3. Sixty-one facilities with 2.2% positivity from 10,001 HIV tests and high ML-predicted risk, and;
4. Fifty-seven facilities with 3.3% positivity from 6,706 HIV tests and medium ML-predicted risk.



Conclusions: This analysis identified distinct HIV hotspots. High ML-predicted risk but low positivity might suggest undertesting/emerging transmission trends; medium-risk hotspots with high positivity could indicate opportunities for prevention. These findings indicate the potential for ML-based identification of case surveillance signals to enhance HIV case finding and prevention in high-risk areas.

EP1099

Diagnostic trends and outcomes of cervical biopsy specimens analyzed at Chinsali General Hospital: a retrospective cross sectional study in Muchinga Province, Zambia

A. Maleti[1], D. Silweya[2], A. Nyirenda[3], F. Mwale[4], M. Mapipo[5], A. Mumbi[2], J. Nzilla[5], L. Nyirenda[1], P. Daka[5], C. Mwampanja[4], P. Mwala[6], S. Kanyika[6], P. Mutambo[7], D. Chisompola[8]
[1]USAID Action To HIV, Laboratory, Chinsali, Zambia, [2]Provincial Health office, Ministry Of Health, Chinsali, Zambia, [3]Histopathology, Laboratory, Chinsali, Zambia, [4]USAID Action To HIV, Chinsali, Zambia, [5]Ministry of Health, Laboratory, Chinsali, Zambia, [6]USAID Action To HIV, Lusaka, Zambia, [7]Ministry of Health, Chinsali, Zambia, [8]Ministry of Health, Laboratory, Ndola, Zambia

Background: This study aimed to investigate the diagnostic trends and outcomes of cervical biopsy specimens examined at Chinsali General Hospital in Zambia. The primary objective was to address the knowledge gap on cervical pathology prevalence and diagnostic trends in Muchinga Province, particularly considering the increased efforts in cervical cancer screening. The research seeks to contribute valuable insights into cervical pathology, focusing on demographic and pathological distribution.
Methods: A retrospective cross-sectional study was conducted at Chinsali General Hospital, Muchinga Province, Zambia, from July 2023 to October 2024. During this period, all 290 examined cervical biopsy samples were included in the study. To determine cervical biopsy diagnostic trends and outcomes, data analysis was done, and descriptive statistics were reported
Results: Out of 290 results obtained, high-grade squamous intraepithelial lesions (HSIL) were the most prevalent pathology, identified in 78 cases (27%), while adenocarcinoma was the least frequent, with 6 cases (2%). Notable findings included 61 cases of chronic cervicitis (21%), 52 cases of squamous cell carcinoma (SCC) (18%), 39 cases of low-grade squamous intraepithelial lesions (LSIL) (13%), and 54 cases (19%) categorized under other pathologies. Age-specific prevalence analysis revealed a higher incidence among females aged 37–56, with HSIL (53%) exhibiting the greatest diagnostic prevalence in this age group. Monthly trends indicated a consistent increase in biopsy volumes, peaking at 59 specimens (16%) in August 2024.
Conclusions: The study's findings highlightthe importance oftargeted interventions and surveillance for cervical cancer prevention, particularly in high-prevalence age groups. The high rates of HSIL, SCC, and LSIL emphasize early detection's critical role, while chronic cervicitis and adenocarcinoma cases require continued monitoring.
This research provides valuable baseline data for evaluating prevention programs and shaping community interventions, with future efforts focused on refining strategies to reduce cervical cancer burden in affected areas.

EP1100

Community HIV testing: a complementary approach for Liberia to achieve the 95-95-95 HIV global goals

J.K. Tonorlah[1], R. Lyimo[1], P. Varney[1], J. Freeman[1], T. Dolo[1], N.F. Clement[1], J. Flomo[2], M. Tobii[2], C. Akolo[3], G. Kamanga[1]
[1]FHI 360/EpiC Project, Monrovia, Liberia, [2]National AIDS and STI Control Program, Monrovia, Liberia, [3]FHI 360, Washington, DC, United States

Background: The Meeting Targets and Maintaining Epidemic Control (EpiC) project in Liberia supports the National AIDS Control Program (NACP) to achieve the UNAIDS 95-95-95 global targets. In 2022, Liberia's progress toward the global target was 66-93-76. To address some of the gaps in achieving the first 95, the FHI 360-led EpiC project strengthened community outreach and testing approaches to complement facility testing to improve HIV case finding.
Description: From October 2022 to September 2024, EpiC engaged 26 PEPFAR-supported health facilities and 10 civil society organizations (CSOs) to implement dynamic community outreach and testing initiatives.
These facilities and CSOs collaborated to map areas with potential increases in sexual activities, including Jorbu sites (where at-risk females operate), hubs where tricycle riders and commercial drivers congregate, dedicated safe spaces for at-risk, and busy marketplaces. Peer educators and peer navigators were assigned to raise awareness and facilitate HIV testing, conducted by health facility staff in the community.
We used routine service data and t-tests to analyze the difference in case finding between facility- and community-based testing methods.
Lessons learned: Facilities tested 191,583 recipients of care (ROC) and identified 7,721 HIV cases (4.03%) (Figure 1).

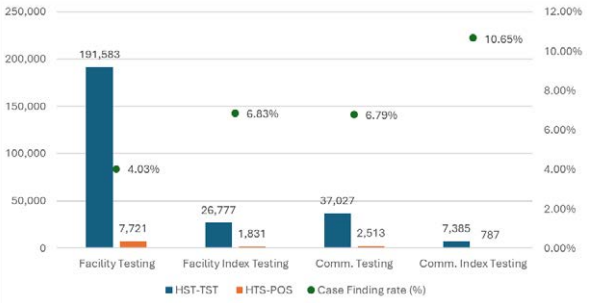

Figure 1.

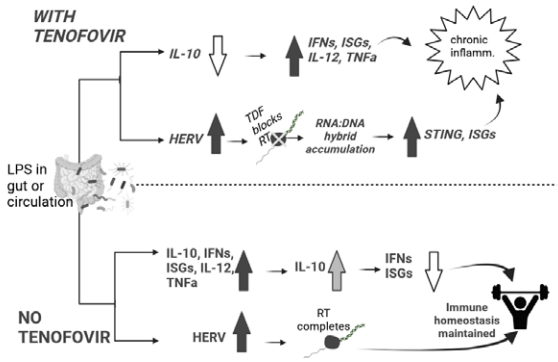
Community outreach efforts tested 37,027 ROC and identified 2,513 cases (6.79%), demonstrating statistically higher case-finding rates (point estimate of difference=2.8%, CI: 2.5%–3.0%, p<0.001).
HIV case finding for index testing was also higher for community vs. facility testing (point estimate of difference=3.8%, CI: 3.0%–4.6%, p<0.001), with 7,385 individuals tested in the community compared with 26,777 at facilities, and HIV case finding was 787 (10.7%) and 1,831 (6.8%), respectively.
Conclusions/Next steps: Integrating community-based HIV testing with facility-based approaches significantly improves overall HIV case finding. EpiC, in collaboration with NACP, will continue to support CSO partners to further refine and scale up these interventions.

EP1101

In vitro modeling of interferon system stimulation by tenofovir

C. Levy[1], C.M. Cameron[2], H. Lindley[3], B. Richardson[3], S. Hughes[1], C. Celum[4,5,6], B. Tamilselvan[3], M. Cameron[3], J. Lingappa[4,6,7], F. Hladik[1,8,6], R. Mackelprang[1], Partners in Prevention HSV/HIV Transmission Study Team & the Partners PrEP Study Teams
[1]University of Washington, Obstetrics and Gynecology, Seattle, United States, [2]Case Western Reserve University, Department of Nutrition, Cleveland, United States, [3]Case Western Reserve University, Department of Population and Quantitative Health Sciences, School of Medicine, Cleveland, United States, [4]University of Washington, Department of Global Health, Seattle, United States, [5]University of Washington, Department of Epidemiology, Seattle, United States, [6]University of Washington, Department of Medicine, Seattle, United States, [7]University of Washington, Department of Pediatrics, Seattle, United States, [8]Fred Hutch Cancer Center, Vaccine and Infectious Disease Division, Seattle, United States

Background: Many PLWH on ART have elevated inflammation despite undetectable viral loads. We and others showed that this inflammation centers on upregulation of interferon stimulated genes (ISGs), and, independently, that the nucleotide analogue reverse transcriptase inhibitor (NRTI) tenofovir induces such ISGs after both oral and topical treatment in the absence of HIV infection.
Here, we established an *in vitro* model to study the mechanisms of this ISG activation by NRTIs.
Methods: We stimulated PBMCs from 33 donors with 100 ng/µL lipopolysaccharide (LPS) without or with 25 µM tenofovir disoproxil fumarate (TDF) for 24 hours, followed by mRNA sequencing.
We repeated this setup with PBMCs from 5 more donors, adding three doses of the immunomodulator interleukin-10 (IL10) (1E2, 1E3 and 1E4 pg/mL), and measured mRNA expression of ten ISGs, as well as IL10 and IL12B, by digital PCR. In 2 donors, we also measured IL10 and IL12B protein in culture supernatants. We used mixed effects modeling to describe ISG changes as a function of recombinant IL10 concentration.
Results: mRNA sequencing in 33 donors showed concordance of gene expression changes with our previous *in vivo* findings on TDF, especially upregulation of ISGs and IL12B, and downregulation of IL10. Using PCR, we corroborated this TDF effect in 5 separate donors and found that adding IL10 reversed ISG expression in a dose-dependent manner. In 2 donors, we confirmed IL10 down- and IL12B upregulation by TDF at the protein level.



Conclusions: Our work provides an *in vitro* model to study the mechanisms of ISG activation by tenofovir and other NRTIs, specifically that tenofovir treatment suppresses immunoregulatory IL10 and activates ISGs (for hypothetical mechanisms, see Figure 1).
Our results are consistent with other recent data and suggest that PLWH might benefit from medically mitigating tenofovir-induced chronic ISG activation.

EP1102

Predictors of hepatitis B infection among children and adolescents living with HIV at a pediatric center of excellence in Cameroon

A.-A. Mbouche Kamgueng[1], J. Fokam[2], G. Ekanga[1], G.R. Nsenga Djapa[3]
[1]Université des Montagnes, Bangangte, Cameroon, [2]Université de Buea/CNLS, Yaoundé, Cameroon, [3]Université de Dschang, Dschang, Cameroon

Background: Hepatitis B virus (HBV) remains a global health challenge with about 350 million chronic carriers worldwide. Among people living with HIV, HBV coinfection is high with 8.3% prevalence in Cameroon. Of note, HBV infection at infancy leads to 90% risk of developping hepato-cellular carcinoma in adulthood especially in case of HIV coinfection. The scarcity of evidence on HBV among children and adolescents living with HIV (CALHIV) requires investigation for context specific decision-maiking.
We sought to ascertain the prevalence and predictors of HBV among CALHIV within the health system of Cameroon.
Methods: A facility-based study was conducted among CALHIV at the pediatric centre of excellence in Ebolowa Regional Hospital, South region of Cameroon, from June-September 2024. From every consenting CALHIV, socio-demographic and clinical features were collected on standard sheets; whole blood was collected on EDTA tubes; overt-HBV was tested by HBs Ag rapid diagnostic test targeting 5 biomarkers (HBs Ag, Anti-HBs, Anti-HBc, Anti-HBe, HBe Ag) and occult-HBV was tested by stan-

dard-PCR on anti HBc+/HBs Ag- samples. Data were analysed using a multivariate logistic regression for predictors of HBV, with p<0.05 considered statistically significant.

Results: Out of 100 CALHIV on site, 86 were enrolled. Mean-age was 12.41±4.79 years, 55.81% female, 65.12% residing in rural-settings, 48.84% with a primary educational level, all were receiving ART with 97.67% being on dolutegravir-containing regimens, 75.58% were ART-adherent and 69.77% had achieved undetectable viral-load (<50 copies/mL). Of the 13 reactive to anti-HBc (15.12%), three were positive for overt-HBV and no case of occult-HBV was detected, giving an overall HBV prevalence of 3.49% (3/86). Interestingly, 2/3 HBV-positive cases were viremic, from one HBV-negative and 2 HBV-unknown status mothers, 3/3 HbeAg-negative and 1/3 elevated-ALT.

Following multivariate analysis, only history of blood transfusion (OR=5.56 [1.30-23,72], p=0.02) and sexual intercourse (OR=5.77[1.22-27.41], p=0.03) were independently associated with HBV-infection among these CALHIV.

Conclusions: Despite HBV high-endemicity in adult-populations, its burden appears low (<5%) among ART-experienced CALHIV within the Cameroonian health system, driven essentially by overt-HBV in the frame of antiretrovirals treating HIV/HBV.

Hence, eliminating HBV among CALHIV in care requires focusing on those sexually active or with history of blood transfusion in settings like Cameroon.

EP1103

Identifying heterogeneity in HIV risk among Pastoralist youth in Southern Ethiopia using a latent class analysis

S.H. Hebo[1,2], F. Schneider[3], M. Spigt[2,4]

[1]Arba Minch University, Reproductive Health, Arba Minch, Ethiopia, [2]Maastricht University, Family Medicine, Maastricht, Netherlands, the, [3]Maastricht University, Health Promotion, Maastricht, Netherlands, the, [4]UiT the Arctic University of Norway, Community Medicine, Tromso, Norway

Background: Despite ongoing efforts, new HIV acquisition among youth aged 15 to 24 years continues to rise in sub-Saharan Africa, largely due to risky sexual behaviors drived by underlying social and structural risk factors. Understanding the diverse risks faced by youth and identifying those most at risk is essential for effective HIV prevention. However, there are limited person-centred approaches to identify and target the highest-risk groups.

Primarly, the objective of this study was to identify heterogenity in HIV risk among pastoralist youth based on their exposure to soial and structural HIV risk factors.

Additionally, it seeks to examine the association between heterogenious HIV risk sub-groups and their engagement in risky sexual behaviors/HIV preventive practices.

Methods: This study employed a cross-sectional design among pastoralist youth (15-24 years) in pastoralist districts of southern Ethiopia from April 1 to May 29, 2024. We collected data from 638 randomly selected participants through interviewer-administered surveys. Latent class analysis was utilized to identify the distinct HIV risk sub-groups and their association with risky sexual and preventive behaviors were assessed using binary logistic regression.

Results: The analysis identified three sub-groups of youth with varying HIV risk: high-risk (39.7%), precarious-risk (42.0%), and low-risk (18.3%) sub-groups. The high-risk group had significantly higher odds of engaging in risky behaviors such as having multiple sexual partners (AOR=4.63; 95% CI=2.53-8.50), transactional sex (AOR=2.94; 95% CI=1.22-7.08), inter-generational sex (AOR=2.06; 95% CI=1.07-3.99), and alcohol use before last sex (AOR=6.09; 95% CI=2.61-14.21) compared to the low-risk group.

The precarious-risk group also had elevated risk behaviors compared to the low-risk group. However, the high-risk group had higher odds of HIV testing (AOR=1.98; 95% CI=1.18-3.32) than the precarious-risk group. Precarious-risk group had no significant difference in HIV testing status compared to the low-risk group (AOR=0.60; 95% CI=0.27-1.37).

Conclusions: The findings highlight the diverse and nuanced HIV risk profiles among pastoralist youth, suggesting that a one-size-fits-all approach to HIV prevention is insufficient. The highest-risk group should be prioritized due to their pronounced risk experience and behaviors, but the precarious group also requires attention, as they remain less likely engaged in preventive behaviours despite their elevated risk.

EP1104

Bridging gaps in access to oral HIV pre-exposure prophylaxis (PrEP): implementation outcomes of a pharmacy-led PrEP service delivery model in Klang Valley, Malaysia

Y.N. Gan[1,2], I. Azwa[3,4], S.A. Hafidzar[4], F.L. Altice[5,6,7], S.H. Lim[1,4], R. Ahmad Zaki[1,8]

[1]Universiti Malaya, Department of Social & Preventive Medicine, Kuala Lumpur, Malaysia, [2]Ministry of Health Malaysia, Malaysian Health Technology Assessment Section, Putrajaya, Malaysia, [3]Universiti Malaya, Infectious Diseases Unit, Department of Medicine, Kuala Lumpur, Malaysia, [4]Universiti Malaya, Centre of Excellence for Research in Infectious Diseases and AIDS (CERiA), Kuala Lumpur, Malaysia, [5]Yale School of Medicine, Section of Infectious Diseases, Department of Internal Medicine, New Haven, United States, [6]Yale School of Public Health, Department of Epidemiology of Microbial Diseases, New Haven, United States, [7]Yale University, Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States, [8]Universiti Malaya, Centre for Epidemiology and Evidence-based Practice (CEBP), Kuala Lumpur, Malaysia

Background: Oral HIV pre-exposure prophylaxis (PrEP) is available for free in public clinics, but uptake remains low (<5,000 users) in Malaysia, potentially due to stigma, long waiting times, and limited clinic hours. To address this, we piloted a pharmacy-led PrEP service delivery model.

Methods: We conducted a single-arm prospective study at six private pharmacies in urban Klang Valley between October 2023 and October 2024. Pharmacists assessed

PrEP eligibility for participants aged 18-49 using digital checklist-based tools, facilitated oral-fluid HIV self-testing, provided PrEP counselling, coordinated electronic prescriptions with physicians through an existing telemedicine platform, and dispensed PrEP at a participant fee of ~USD $15/month.

Follow-up occurred at month-1, month-4, and month-7 post-initiation. A subgroup (n=30) self-reporting continuing PrEP use and a negative HIV test within three months was followed-up at month-3 and month-6. Implementation outcomes data (acceptability, appropriateness, feasibility, fidelity, and sustainability) were collected through post-study online surveys while adoption/uptake was evaluated via participant records.

Acceptability, appropriateness, and feasibility were measured with a 4-item validated tool; fidelity was based on eight items related to core service components; sustainability was measured by satisfaction and willingness to recommend and continue the service at retail price (~USD $35/month).

Results: A total of 230 participants were enrolled: 211 attended baseline visits, while 19 defaulted. Median age was 30 years (IQR 8), 92% were gay/bisexual men, 37% reported condomless sex in the past three months, 52% were first-time PrEP users, and 65% preferred event-driven PrEP. Initiation rate was 98% (205/208); one was linked to care following a positive HIV test, two had medical contraindications, and three declined PrEP. Retention rates were 82% (169/205) at the first follow-up, 75% (155/205) at the second, and 72% (127/175) at the third, excluding the 30 participants requiring only two follow-ups.

Survey completion was 79% (166/208). Mean scores for acceptability, appropriateness, feasibility, and fidelity were 4.81, 4.77, 4.76, and 4.76, on a 5-point scale. Satisfaction (9.39/10) and willingness to recommend (98%; 164/166) and continue the service (83%; 137/166) were high.

Conclusions: Findings demonstrate high implementation effectiveness and potential for pharmacy-led PrEP services as an alternative access point, supporting broader implementation across Malaysia and similar settings.

EP1105

Barriers to the diagnosis and treatment of tuberculosis in people with and without HIV in Abidjan, Côte d'Ivoire: a qualitative study

N.A. Benzekri[1], E. Komena[2], A. Tohbi[3], P. Gousse[3], A. Jaquet[4], R. Moh[2], T. Ouassa[5], S. Sidibé[6], O. Marcy[4], E. Messou[3], on behalf of the IeDEA West Africa Collaboration

[1]University of Washington, Departments of Medicine (Infectious Diseases) and Population Health, Seattle, United States, [2]PAC-CI Research Program, Abidjan, Côte d'Ivoire, [3]CePReF, Abidjan, Côte d'Ivoire, [4]University of Bordeaux, National Institute for Health and Medical Research (INSERM) UMR 1219, Research Institute for Sustainable Development (IRD) EMR 271, Bordeaux, France, [5]CEDRES, Abidjan, Côte d'Ivoire, [6]Programme National de Lutte contre la Tuberculose, Abidjan, Côte d'Ivoire

Background: Tuberculosis (TB) remains a leading cause of morbidity and mortality in West Africa. We sought to identify barriers to the diagnosis and treatment of TB from the participants' perspective in Côte d'Ivoire, West Africa.

Methods: We conducted a qualitative sub-study within the TB-Sentinel Research Network of IeDEA at the CePReF clinic in Abidjan, Côte d'Ivoire. Individuals ≥18 years of age who had received treatment for pulmonary TB within the preceding 12 months were interviewed. We collected and analyzed qualitative data using the Classic Grounded Theory approach. Descriptive analysis of quantitative variables was performed.

Results: Interviews were conducted with 40 participants (median age 35 [IQR 25-46] years), including 19 (47.5%) women and 9 (22.5%) people living with HIV (PLHIV). Participants experienced a substantial delay between symptom onset and TB diagnosis despite the presence of active TB symptoms and persistent care seeking.

They sought care a median of 3 [IQR 2-5] times before TB testing and experienced a median diagnostic delay of 4 [IQR 3-6] months between symptom onset and TB diagnosis.

The patient care pathway consisted of three distinct phases:

i. Care-seeking,

ii. Diagnosis, and;

iii. Treatment.

Seven categories emerged across the three phases, each representing a potential barrier to the diagnosis and treatment of TB: delayed TB diagnosis (sub-categories: prolonged care-seeking, financial burden, and turning to sorcery), fear of TB, TB-associated stigma, financial distress, food insecurity, enduring isolation (sub-categories: psychological distress and social setbacks), and adherence anxiety.

Each of these barriers was exacerbated among PLHIV. In particular, PLHIV feared that the TB diagnosis would cause others to suspect them of having HIV, and result in inadvertent status disclosure and further stigmatization.

Conclusions: To our knowledge, this is the first qualitative study to explore barriers to the diagnosis and treatment of TB in Côte d'Ivoire. Throughout each phase of the care pathway, individuals with TB persist and persevere de-

spite enormous challenges. There is a need for strategies to alleviate their burden, to improve the early recognition and diagnosis of TB, and to address TB-associated stigma. Research to develop and implement social protection strategies for individuals diagnosed with TB should be prioritized.

EP1106

Prevalence of HIV drug resistance among clients on dolutegravir-based regimens with viral non-suppression – Tanzania, 2023

F. Msafiri[1], A. Mganga[1], A. Wang[2], C. Festo[1], A. Ismail[2], W. Mauka[1], C. Mahende[3], H. Msuya[2], T. John[2], W. Maokola[4], D. Kamugumya[2], V. Mushi[1], D. Temba[1], B. Jullu[1], D.-P. Zheng[3], S. Pals[3], M.J. Mahande[1], N. Aitcheson[3], M. Swaminathan[2], S. Porter[2], D. Sando[1]

[1]Management and Development for Health, Strategic Information and Research, Dar es Salaam, Tanzania, the United Republic of, [2]U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, [3]U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, [4]National AIDS, STIs and Hepatitis Control Programme (NASHCoP), Dodoma, Tanzania, the United Republic of

Background: Introduced in 2019, now over 90% of HIV clients receive DTG-containing antiretroviral regimens. Monitoring emerging resistance to DTG is important for the long-term efficacy of DTG-containing regimens.

We report interim findings from the first laboratory-based HIV drug resistance (HIVDR) surveillance activity in Tanzania among children and adults with unsuppressed HIV viral load (VL) conducted between April-September 2023.

Methods: Remnant plasma specimens from routine HIV VL tests were collected from nine purposively selected, high-volume reference laboratories throughout Tanzania. All specimens from clients with unsuppressed HIV VL (≥1,000 RNA copies/mL) taking DTG-containing regimens for ≥9 months during the surveillance period were eligible for genotyping.

Client demographics and clinical history were extracted from a national HIV clinical database. HIV-1 protease and reverse transcriptase (PRRT) and integrase (IN) genes were amplified and genotyped using ThermoFisher HIV-1 Genotyping Kit with Integrase; sequences were interpreted using the Stanford HIV Drug Resistance Database (v9.5.1).

We report proportions of clinically significant HIVDR among children (<15 years) and adults (≥15 years) with completed INT and PRRT genotypes, weighted to account for incomplete genotype data in this interim analysis.

Results: A total of 388 eligible pediatric samples and 919 eligible adult samples were identified during the surveillance period. Among 207 (53.4%) children with a completed IN genotype, 6.2% (95% confidence interval (CI): 13.6-10.4) had DTG resistance.

Among 56 (14.4%) children with a completed PRRT genotype, 34.2% (95% CI: 22.6-48.1) had NRTI-class resistance, 35.5% (95% CI: 23.7-49.5) had NNRTI-class resistance, and 3.5% (95% CI: 0.9-13.3) had PI-class resistance. Among 381 (41.5%) adults with a completed IN genotype, 5.3% (95% CI: 3.4-8.1) had DTG resistance.

Among 244 (26.6%) adults with a completed PRRT genotype, 6.9% (95% CI: 4.4-10.8) had NRTI-class resistance, 21.4% (95% CI: 16.6-27.0) had NNRTI-class resistance, and 3.8% (95% CI: 2.1-7.0) had PI-class resistance. Mutations identified affecting DTG efficacy included E138A/K, G118R, Q148K/R, G140A, R263K, S147G, T66A/I/K, and N155H.

Conclusions: Interim analysis showed that prevalence of DTG resistance among children and adults with unsuppressed HIV VL was low and comparable to other countries in sub-Saharan Africa. Our findings indicated DTG-containing regimens remain effective in treating HIV in Tanzania.

EP1107

Determinants of communities' access to HIV health services in rural Zimbabwe: evidence from community led monitoring programme in Zimbabwe

M. Chinoona[1]

[1]FACT Zimbabwe, Health and Wellbeing, Mutare, Zimbabwe

Background: This paper analyses the determinants of people's access to immunodeficiency virus (HIV) health services in rural Zimbabwe where Global Fund to Fight AIDS, Tuberculosis and Malaria (GF) funded CLM program is implemented since 2021. FACT Zimbabwe as a sub recipient (SR) of GF and its partners are among the pioneers of CLM in Zimbabwe. District selection was on the basis of inclusivity in terms of geographical representation and implementing partner.

Description: About, 1.3 million Zimbabweans were living with HIV in 2021 amid declining prevalence rate in the general population. However, rural communities, women and key populations remain disproportionately burdened by HIV. In this context FACT Zimbabwe is implementing community led monitoring (CLM) to foster access improvements, accountability and advocacy. CLM data is collected from service users by community health monitors and is analyzed to draw insights on barriers to HIV health services quarterly. Findings are shared at facility and district levels with resolutions and action points for improvements. Any unresolved issues at facility and district levels are escalated to provincial and national levels.

Lessons learned: Access to HIV services in rural Zimbabwe comes with hidden costs such as transport costs and walking long distances with 44.2% reported traveling over 5km to health facilities. Distance decay is more pronounced with HIV testing services (HTS). The longer the distance the less likely that people will seek HTS services compromising early diagnosis and treatment. This is compounded by opportunity cost arising from long waiting time due to inadequate staff.

Furthermore, key populations such as sex workers and men who have sex with men (MSM), also have limited access to quality services due to elevated stigma and discrimination in rural settings.

Conclusions/Next steps: Access to HIV services in rural Zimbabwe is fraught with hidden costs that discourage services seeking like transport cost, long distances, opportunity costs and elevated discrimination of PLHIV and key populations. Low availability and frequent stockouts of medicines and commodities further compromise access to HIV health services.

Next Steps

- Advocate for increased human resources and uninterrupted supply of medicines.
- Advocate for decentralization of health centres and HIV testing points to increase accessibility of the services.

EP1108

Towards precision public health in HIV prevention: Leveraging smartphone GPS data to understand activity spaces for young adults in rural KwaZulu-Natal, South Africa

K.H. Tram[1], E. Okango[2], T. Mathenjwa[2], A. Nitschke[3], F. Egersdörfer[3], T. Bärnighausen[3,2,4], A. Dobra[5], F. Tanser[2,6]
[1]University of Washington, Department of Medicine, Seattle, United States, [2]Africa Health Research Institute, Durban, South Africa, [3]Heidelberg Institute of Global Health, Heidelberg, Germany, [4]Harvard T.H. Chan School of Public Health, Harvard University, Department of Global Health and Population, Boston, United States, [5]University of Washington, Department of Statistics, Seattle, United States, [6]Stellenbosch University, School of Data Science and Computational Thinking, Stellenbosch, South Africa

Background: Precision public health approaches aim to deliver targeted, personalized public health interventions. Given persistently high HIV rates in rural South Africa, we used time-stamped and contextually-linked, ultra-high resolution smartphone GPS data to evaluate the activity spaces of young adults in an HIV hyper-endemic setting, with the goal of developing precise HIV prevention interventions.

Methods: Between 2021-2023, the study enrolled a random sample of young adults aged 20-30 years from the AHRI population-based cohort. Participants received a smartphone with the study app or installed the app on their own devices, which recorded GPS locations at regular intervals over the six-month study period.

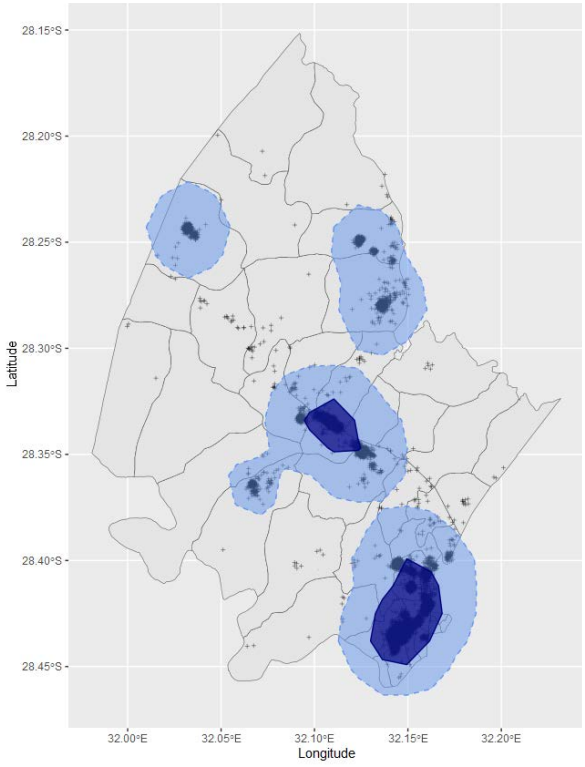
Location data was analyzed to construct individual 'activity spaces', conceptualized as the individual's home range and represented by the utilization distribution (UD), derived using kernel density estimation. UD is a spatial probability density function used to estimate the probability of finding an individual at a particular location within their home range.

We estimated home range sizes at the 50%, 95%, and 99% contour levels and calculated the degree of spatial overlap between each participant's UD and high HIV prevalence areas.

Results: In total, 202 individuals contributed a median 74,865 (IQR 28,410 – 183,672) locations.

Median home range area was 1.5 km^2 (IQR 0.3-4.5) at 50% contour, 15.5 km^2 (5.0–39.8) at 95% contour, and 39.6 km^2 (18.5–105.1) at 99% contour.

Spatial overlap of the 95% home range with a geographic area of high HIV prevalence was found for pver one third of participants (39.1%).



Conclusions: Activity spaces, analogous to home ranges in ecology, can be quantified at granular detail using smartphone GPS. Understanding dynamic patterns of movement and time spent in certain locales, coupled with ecological momentary assessments, can help design HIV prevention interventions through behavior, social or structural support that is precise in time, space, and epidemiological context.

OAA01 Targeting the HIV reservoir: Emerging discoveries and novel interventions

OAA0106LB

Defective HIV-1 proviruses recombine to restore infectious virus: a new barrier to cure

H. Imamichi[1], T. Imamichi[2], F. Scrimieri[2], B.T. Sherman[2], W. Chang[2], H.C. Lane[1]

[1]National Institute of Allergy and Infectious Diseases, Bethesda, United States, [2]Frederick National Laboratory for Cancer Research, Frederick, United States

Background: Recent studies have shown that "defective" HIV-1 proviruses are capable of transcription and translation into proteins. This study was designed to directly investigate whether these "defective" proviruses can recombine to regenerate replication-competent virus.

Methods: We established a model system using two defective HIV-1 proviruses derived from a person with HIV (PWH), each containing distinct large internal deletions: a 3'-deleted provirus with a 3.8 kb internal deletion missing the *vif*, *vpr*, *vpu*, *tat*, *rev*, *env*, and *nef* regions, and a 5'-deleted provirus with a 3.3 kb deletion missing the *gag* and *pol* regions.

Notably, the precursor frequency of full-length intact HIV-1 proviruses in the PWH was 1 in 697 sequences (~0.1%), based on analysis of autopsy tissue specimens. Primary CD4+ T cells from HIV-negative donors were co-transfected with pNL4-3 plasmids containing synthesized inserts representing the 3'- or 5'-deleted HIV-1 proviruses.

Viral production was assessed by measuring p24 antigen levels and examining viral particle morphology via transmission electron microscopy (TEM).

HIV-1 infectivity was evaluated through four rounds of *in vitro* passaging. Single-genome amplification (SGA) and full-length HIV-1 sequencing were used to characterize recombination events.

Results: We demonstrate for the first time that two defective HIV-1 proviruses can recombine to regenerate a fully replication-competent virus. Co-transfection resulted in robust p24 production (1,100 ng/mL at day 7 post-transfection) and successful infection of primary CD4+ T cells (9,900 ng/mL at day 7 post-infection). Sequence analysis revealed recombination events restoring intact open reading frames and correcting deleterious large internal deletions. Critically, the emergent viruses replicated with kinetics comparable to wild-type HIV-1.

These findings show that defective proviruses, once thought to be biologically inert "dead-end" products, can actively contribute to viral persistence and reservoir replenishment.

Conclusions: Recombination between defective HIV-1 proviruses represents a novel and active mechanism of viral evolution, with direct implications for cure strategies, and may help explain the source of delayed viral rebound in some rare cases following ART interruption. Strategies for HIV-1 eradication must consider the potential for defective genomes to recombine and regenerate infectious virus, posing a new and significant barrier to achieving durable remission.

OAA03 Advances in HIV vaccine platforms

OAA0306LB

Cross-clade HIV-1 neutralizing antibodies with characteristics of bNAbs in pediatric populations of humans and rhesus macaques

R. Tuck[1], A. Nelson[2], Y. Chen[1], S. Holmes[1], S. Rohr[1], M. Berry[1], A. Eaton[1], R.J. Edwards[1], K. Mansouri[1], T. Spence[1], M. Clark[1], D.N. Chaturbhuj[3], P.J. Klasse[3], M.S. Seaman[4], D.C. Montefiori[1], K. Wiehe[1], G. Fouda[2], W. Williams[1]

[1]Duke University School of Medicine, Duke Human Vaccine Institute, Durham, United States, [2]Weill Cornell Medicine, Pediatrics, New York, United States, [3]Weill Cornell Medicine, Microbiology and Immunology, New York, United States, [4]Harvard Medical School, Beth Israel Deaconess Medical Center, Cambridge, United States

Background: Induction of HIV-1 envelope (Env)-reactive broadly neutralizing antibodies (bNAbs) is a primary goal of a prophylactic HIV-1 vaccine. There is a dearth of bNAbs from pediatric populations that may be used to inform immunogen design for their induction and maturation in infants and children through vaccination.

Methods: We assessed HIV-1 neutralization breadth in 13 young rhesus macaques (RMs) following clade C SHIV infection during infancy and 47 children with perinatally acquired clade B HIV-1.

We isolated Env SOSIP-trimer reactive B cells from blood of representative subjects with broad and potent responses. Recombinant monoclonal (m) Abs with paired variable heavy (V_H) and light (V_L) genes per B cell were functionally characterized and visualized for Env-interaction via negative stain electron microscopy.

Results: Of 13 SHIV-infected RMs, 62% developed plasma heterologous HIV-1 NAbs. We isolated two clonally-related mAbs (DH1518.1 and DH1518.2) that used V_H4-NL-22 (17 amino acid (aa) complementarity-determining-region-3/HCDR3) and V_K2-X from one RM at month 14 post-infection. The DH1518 mAbs neutralized ~13% of 119 difficult-to-neutralize/ tier 2 multiclade HIV-1 strains (Geometric mean, IC50: ~8-11µg/ml) and mapped to a discontinuous epitope partially occluded by glycans and span V2-apex, V3-glycan and CD4-binding site (BS) bNAb epitopes.

Additionally, 34% of children with HIV-1 showed heterologous tier 2 HIV-1 NAbs. We isolated two mAbs, DH1668 and DH1669, from B cells sampled at 3.5 years-of-age of a child who developed neutralization breadth at one year-of-age. The mAbs DH1668 used V_H3-21 (28aa-long HCDR3) and V_K1-33, and DH1669 used V_H3-33 (5aa-long HCDR3) and V_L4-69, and mapped to CD4BS and V3-glycan bNAb

epitopes, respectively. Compared to DH1668, DH1669 had maximal neutralization activity against 37% (11/30) of multiclade isolates (Geometric mean, IC50: 0.25µg/ml), and neutralized 40% (4/10) of breastmilk-derived clade C isolates. All isolated mAbs were derived from subdominant B cell subsets in subjects studied.

Conclusions: We defined pediatric cross-clade HIV-1 NAbs that target bNAb epitopes, thus implicating that they may be matured over time with appropriate vaccine immunogens.

Ongoing studies will identify additional NAbs in infant RMs and humans to inform immunogen design for early-life prophylactic bNAb-inducing HIV-1 vaccines—a potential strategy for ending the HIV-1 pandemic.

OAA04 From cells to systems: The power of omics in HIV research

OAA0406LB

Increased systemic inflammation and plasmacytoid dendritic cells in people living with HIV with history of cured pulmonary TB

M. Ward[1], Y. Joseph[2], D. Lespinasse[2], P. Zumbo[1], A. Apollon[2], E. Dumont[2], D. Fitzgerald[1], J. Pape[2,1], K. Dupnik[1]
[1]Weill Cornell Medicine, New York, United States, [2]GHESKIO, Port au Prince, Haiti

Background: In Haiti, people living with HIV who have history of TB have increased all-cause mortality despite virologic suppression and TB cure (Joseph, 2021). Our objective was to assess for the post-TB immunologic profile in people living with HIV.

We hypothesized that people with history of TB have enduring elevated inflammatory cells and cytokines which contribute to worse outcomes after TB.

Methods: Peripheral blood mononuclear cells were collected from people living with HIV who participated in an observational study on TB recurrence at GHESKIO Centers in Port au Prince, Haiti between 2019 and 2023.

We completed Cellular Indexing of Transcriptomes and Epitopes by Sequencing (CITE-Seq) of peripheral blood mononuclear cells (PBMC) of people living with HIV with (n=6) or without (n=3) TB history. Analyses of CITE-Seq data included differential gene expression, principle components analyses, and pathways analyses.

We completed confirmatory dendritic cell subtyping with flow cytometry and plasma cytokine quantification using an 18-plex Th1/Th2 panel on an expanded group of people (n=29).

Results: There were more than 40 differentially expressed genes in the T lymphocyte, B lymphocyte, natural killer cell, and dendritic cell populations. In each of these immune subtypes, the Hallmark gene set "regulated by NF-kB in response to TNF" was over-represented.

In the dendritic cell subset there was over-representation of pathways important for response to TB: response to hydrogen peroxide, oxidative stress, and reactive oxygen species in the 68 differentially expressed genes. In the expanded cohort of 29 people with HIV, there was a larger percentage of plasmacytoid dendritic cells by flow cytometry and increased plasma IL-6, IL-12p70, IL-15, IL-2, IFN-alpha, and TNF in the TB history group (n=18) compared to people with no history of TB (n=11).

These findings remained statistically significant when assessed with Mann-Whitney non-parametric tests and with tobit logistic regression to account for left censoring with and without sex included as a covariate.

Conclusions: A pro-inflammatory milieu and immune cell gene expression changes mediated by TNF persist after TB cure for people living with HIV. If the differences are preexisting risk factors or establish during the natural history of HIV and TB is still to be determined.

OAA05 Basic science highlights: Cutting-edge research and implications

OAA0506LB

Impact of AGT103-T on the HIV proviral reservoir: insights from a modified IPDA in a phase 1 study

G. Canepa[1], L. Xiao[1], A. Jain[2], M.-L. Liou[1]
[1]American Gene Technologies, Discovery, Rockville, United States, [2]American Gene Technologies, Rockville, United States

Background: HIV cure research is challenged by the persistence of the replication-competent proviral reservoir. Our hypothesis is that AGT103-T, a gene therapy designed to protect and boost HIV-specific immune cells, reduces this reservoir.

To accurately assess this effect, we developed a modified Intact Proviral DNA Assay (IPDA) that distinguishes HIV sequences from the AGT103 lentiviral vector.

Methods: In our FDA-approved Phase 1 study, HIV-positive subjects received AGT103-T infusions. Longitudinal peripheral blood samples were collected before and after infusion, including during analytical treatment interruptions (ATIs) that allowed evaluation of viral rebound dynamics in a clinical setting. Our modified IPDA, using primers and probes targeting conserved HIV regions absent in the AGT103 lentiviral vector, quantified both intact and defective proviral DNA in CD4+ T cells.

Results: In all evaluable subjects (n=5), our modified IPDA demonstrated a significant reduction in intact proviral DNA following AGT103-T treatment. For example, one subject's baseline intact proviral level of approximately 1,664 copies per million CD4+ T cells decreased to undetectable levels by 500 days post-infusion, with suppression sustained for up to two years.

Notably, while intact proviral DNA declined markedly, defective proviral DNA levels remained unchanged throughout the study. All subjects underwent ATI, which provided valuable insights into the suppression of viral rebound.

Conclusions: These early findings suggest that AGT103-T therapy may reduce the replication-competent HIV reservoir in people living with HIV. While promising, these re-

sults should be interpreted with caution given the study's limitations (small sample size and variability in ATI timing among participants). Additional trials with larger populations and optimized ATI timing are necessary to further evaluate the clinical efficacy of this immune-regulatory strategy.

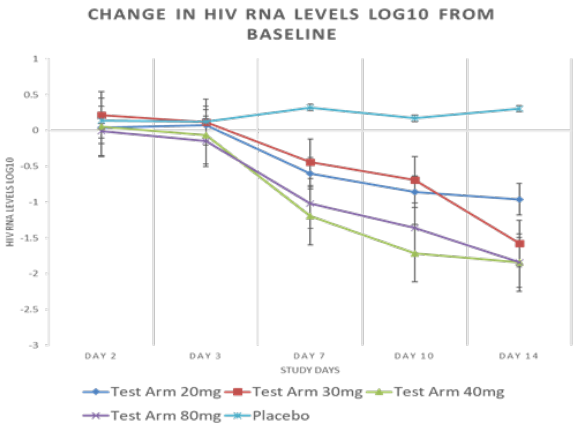
OAB01 ART strategies

OAB0105LB

Promising new therapeutic option for HIV - next generation HIV-1 investigational protease cleavage site (maturation) inhibitor, HRF-10071 - phase 2 results

N. Kumarasamy[1], B. Parthasaradhi Reddy[2], A. Panduranga Reddy[2], K. Ratnakar Reddy[2], D. Shubhadeep Sinha[2], S. Sreenivasa Chary[2], P. Thakur[2], D. Shashidhar Reddy[2], T. Sravan[2], S.K. Tripathi[3]
[1]VHS Infectious Diseases Medical Centre, CART Clinical Research Site, Chennai, India, [2]HETERO LABS LIMITED, Hyderabad, India, [3]Jagannath Gupta Institute of Medical Sciences & Hospital, Clinical Pharmacology, Kolkata, India

Background: HRF-10071 is a new generation protease cleavage site inhibitors that inhibit viral maturation by blocking cleavage of the Gag capsid (CA) precursor, CA-SP1, to mature CA protein. Dose escalating studies (single ascending dose & multiple ascending dose) evaluated in healthy adult human participants. HRF-10071 exposures (C_{max} and AUC) were dose proportional (linear) from 20mg to 160mg and found to be safe and well tolerable. Here we report the outcome of the Phase 2 Proof of Concept study carried out among PLHIV.
Methods: Phase 2 (Proof of Concept) study conducted at 15 sites across India. This study was a double blind, parallel, placebo-controlled study evaluated antiviral effect, safety and tolerability of HRF-10071 20mg, 30mg, 40mg and 80mg dose levels over 14 days of treatment period.



Results: Overall, 30 people (25 males & 5 females) with baseline BMI of 22.4 - 25.3 kg/m², median viral load of 31923 - 89632 copies/mL and CD4 count of 397 - 495 cells/mm³ enrolled. HIV RNA levels decreased significantly from Day 7 onwards in all dose levels. HRF-10071 doses 20mg, 30mg, 40mg & 80mg have shown -0.98, -1.56, -1.84, -1.76 HIV RNA Log10 change from baseline to Day 14 respectively.
The change in HIV RNA levels was statistically significant compared with placebo. Pharmacokinetic profile in study participants is similar to that of healthy people (dose proportional) with steady state reaching between 7-10 days on QD regimen.
Overall, 10 adverse events (9 grade 1 & 1 grade 2) reported in this study were not related to tested compound. No grade 3 or 4 or Severe AEs reported. No patient discontinued due to AE/SAE.
Conclusions: HRF-10071 is a novel potent protease cleavage site inhibitor. Study results have shown significant viral load reductions. This could be a future treatment option for people living with HIV along with other anti-retroviral agents.

OAB0106LB

Systematic review and meta-analysis of the efficacy of intermittent antiretroviral therapy dosing: a crisis response to the sudden cuts in USAID and PEPFAR funding

A. Hill[1], C. Fairhead[2], S. Manalu[3], F. Venter[4], S. Collins[5], R. Landman[6], A. Pozniak[7], E. Martinez[8,9]
[1]University of Liverpool, Department of Pharmacology and Therapeutics, Liverpool, United Kingdom, [2]Royal Free Hospital, Acute Medicine, London, United Kingdom, [3]Universitas Indonesia, Oxford University Clinical Research Unit Indonesia, Faculty of Medicine, Jakarta, Indonesia, [4]Wits Ezintsha, University of the Witwatersrand Faculty of Health Sciences, Johannesburg, South Africa, [5]HIV i-Base, London, United Kingdom, [6]Assistance Publique – Hôpitaux de Paris, Hospital Bichat service des maladies infectieuses et tropicales, Paris, France, [7]Chelsea and Westminster Hospital NHS Foundation Trust, London, United Kingdom, [8]Hospital Clínic de Barcelona, Barcelona, Spain, [9]Instituto de Salud Carlos III, CIBER de Enfermedades Infecciosas (CIBERINFEC), Madrid, Spain

Background: Antiretroviral therapy (ART) shortages due to sudden, severe USAID and PEPFAR funding cuts are predicted to cause millions of HIV-related deaths and new acquisitions. We assessed the efficacy of intermittent ART dosing, which could extend supplies and mitigate this crisis.
Methods: We systematically reviewed PubMed, MEDLINE and ClinicalTrials.Gov. Randomised controlled trials (RCTs) comparing intermittent triple ART taken 3-6 days-per-week versus daily ART in people with HIV-1 of any age were included. Studies with high risk of bias were excluded. 48-week efficacy (HIV viral load (VL) >50 copies/mL) was meta-analysed. Highly-sensitive VL; treatment-emergent drug resistance and inflammation (interleukin-6, d-dimer and highly-sensitive C-reactive protein) were descriptively analysed. This was supplemented by a rapid scoping review of observational studies.
Results: Seven RCTs were included; three evaluated INSTI-inclusive regimens. In total 1286 virologically supressed non-pregnant people with HIV without hepatitis B , with

high CD4 counts and no virologic failure or drug resistance history, were included. RCTs investigated 3, 4 and 5 days-per-week intermittent ART. There was no difference in efficacy [Risk Difference -0.00; 95%CI -0.02-0.02; *P*=0.86]: overall 21/643 (3%) experienced HIV RNA >50 copies/mL with intermittent ART versus 22/643 (3%) with daily ART. Viremia was typically low-level, with re-suppression after adherence counselling and/or return to daily dosing. Where evaluated, there was no difference in highly-sensitive VL or inflammation markers, and satisfaction with intermittent dosing was high.

Overall 9/14 (64%) successfully-genotyped participants with VL >50 copies/mL had treatment-emergent resistance with intermittent ART versus 12/16 (75%) with daily ART, predominantly in lower-genetic-barrier regimens. Five observational studies of 3-6 days-per-week triple ART were identified; HIV VL>50 copies/mL occurred in 6/374 (2%) participants at 48 weeks.

RCT	Strategy	ART regimen	HIV RNA >50 copies/mL; intermittent, n/N (%)	HIV RNA >50 copies/mL; daily, n/N (%)	Resistance**; intermittent, n/N	Resistance**; daily, n/N
BREATHER	5 on, 2 off	NNRTI	6/99 (6%)	7/100 (7%)	2/3	5/6
Reynolds et al.***	5 on, 2 off	NNRTI	5/57 (9%)	9/56 (16%)	4/4	5/7
Sun et al.	5 on, 2 off	B/F/TAF	0/30 (0%)	1/31 (3%)	NA	-
QUATUOR	4 on, 3 off	Triple ART	6/318 (2%)	4/318 (1%)	3/6	2/3
ATAD	Alternate	NNRTI	3/99 (3%)	1/98 (1%)	0/1	-
A-TRI-WEEK	3 on, 4 off	NNRTI	0/30 (0%)	0/30 (0%)	NA	NA
BETAF-RED	3 on, 4 off	B/F/TAF	1/10 (10%)	0/9 (0%)	-	NA

ART = antiretroviral therapy; NNRTI = non-nucleoside reverse transcriptase inhibitor; B/F/TAF = bictegravir/emtricitabine/tenofovir alafenamide; NA = not applicable; - = not reported. *When 4 or 5 days per week dosing is employed, continuous ART is given for these days and then no ART for the rest of the week. When 3 days-per-week dosing is used, the days off ART are not continuous but are instead alternate. **Resistance = treatment-emergent drug resistance. Resistance n/N = number of individuals with mutations conferring resistance to study drugs/ number of reported successfully-genotyped individuals with HIV RNA >50 copies/mL.*** Reynolds et al.: The primary endpoint was changed during the study from <50 copies/ml to <400 copies/ml to eliminate the inclusion of low-level viral blips.

Table 1 - Summary of efficacy (assessed through HIV RNA >50 copies/mL at 48 weeks) and treatment-emergent drug resistance in randomised controlled trials of intermittent versus daily triple antiretroviral therapy.

Conclusions: For countries with urgent drug shortages, evidence supports intermittent dosing 4 to 5 days-per-week to extend ART supplies, with clinical benefits for people with HIV and continued population benefits of minimising HIV transmission.

OAB0206LB

A5391: a randomized multicenter 3-arm controlled trial for people with obesity on integrase inhibitors and tenofovir alafenamide switching to doravirine, with or without tenofovir disoproxil fumarate (The DO-IT Trial)

J. Koethe[1], J. Lake[2], A. Kantor[3], L. Smeaton[3], K. Erlandson[4], L. Moran[5], P. Belaunzaran-Zamudio[6], A. Landay[7], P. Debroy[2], J. Bennet[8], J. O'Halloran[9], W. Min Han[10], O. Alli[6], M. Leonard[1], R. Gulick[11], for the ACTG 5391 (Do IT) Trial Team

[1]Vanderbilt University Medical Center, Nashville, United States, [2]University of Texas Health Science Center at Houston, Houston, United States, [3]Harvard T.H. Chan School of Public Health, Boston, United States, [4]University of Colorado, Aurora, United States, [5]ACTG Network Coordinating Center, Bethesda, United States, [6]National Institutes of Health, Bethesda, United States, [7]University of Texas Medical Branch at Galveston, Galveston, United States, [8]University of the Witwatersrand, Johannesburg, South Africa, [9]St. Vincent's University Hospital, Dublin, Ireland, [10]HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [11]Weill Cornell Medical College, New York, United States

Background: Excessive weight gain has been associated with integrase inhibitors (INSTI) and tenofovir alafenamide (TAF). ACTG A5391 evaluated whether switching to doravirine (DOR; a non-nucleoside reverse transcriptase inhibitor) with or without a switch to tenofovir disoproxil fumarate (TDF) would alter weight in people with HIV and obesity on INSTI+TAF regimens.

Methods: A phase IV, 48-week, 3-arm, open-label, multicenter randomized trial to assess whether switch from an INSTI (bictegravir, dolutegravir, or raltegravir) with TAF/emtricitabine (TAF/FTC) to either DOR+TAF/FTC or DOR+TDF/FTC results in a ≥5% point between-group difference in body weight change (a clinically relevant effect), compared to continuing current INSTI+TAF/FTC. We used linear regression, adjusting for sex and race, to estimate treatment effects.

Results: 145 participants in the US were randomized to change to DOR+TAF/FTC (n=47), DOR+TDF/FTC (n=49), or continue current treatment (n=49). At entry, median age was 49 years; BMI 34.9 kg/m^2; time on INSTI+TAF/FTC 3.4 years; 49% were female, 53% Black, and 18% Hispanic/Latino.

Estimated mean change in weight at 48 weeks was -0.47% (95% confidence interval [CI]: -2.09,1.14) for DOR+TAF/FTC, -2.73% (-4.22,-1.23) for DOR+TDF/FTC, and -1.84% (-3.37,-0.30) for continued INSTI+TAF/FTC. The DOR vs. INSTI (both with TAF/FTC) estimated mean difference was +1.36% points (p=0.23), and the DOR+TDF/FTC versus INSTI+TAF/FTC estimated mean difference was -0.89% points (p=0.41; Figure).

Weight treatment difference 97.5% CI limits were < 5% points. There was not evidence that treatment differences varied by subgroups, including by race or sex. For hip bone mineral density, estimated mean differences were

+0.78% points (p=0.19) and -0.64% points (p=0.27), respectively. The observed median change in creatinine clearance was 4.9% in DOR+TAF/FTC, 7.4% in DOR+TDF/FTC, and 0.4% in INSTI+TAF/FTC.

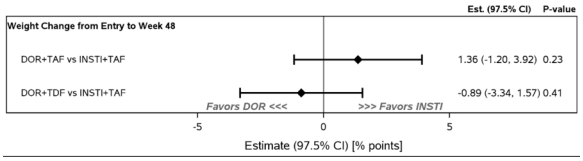


Figure. Treatment difference in body weight change between DOR and INSTI arms at 48 weeks.

Conclusions: In people with HIV and obesity, switching from an INSTI+TAF/FTC regimen to doravirine/FTC with either TAF or TDF did not result in substantial weight change at one year, including among women and Blacks.

Ndlangamandla[2], N. Jeenarain[2], S. Ganesh[2], A. Ramjeith[2], Y. Cazaubon[3], J.P. Moles[3], P. Van de Perre[3], T. Tylleskär[4], P.L. Moore[5,6,7], S. Balla[5,6], N.N. Mkhize[5,6], C. Crowther[5,6], M. Tolazzi[1], S. Dispinseri[1], A. Goga[2,8], on behalf of the PedMAb1 clinical trial team

[1]IRCCS Ospedale San Raffaele srl, Viral Evolution and Transmission Unit, Milan, Italy, [2]South African Medical Research Council, Durban, South Africa, [3]INSERM, University Montpellier, Montpellier, France, [4]University of Bergen, Bergen, Norway, [5]University of the Witwatersrand, SAMRC Antibody Immunity Research Unit, School of Pathology, Faculty of Health Sciences, Johannesburg, South Africa, [6]National Institute for Communicable Diseases, Centre for HIV and STIs, division of the National Health Laboratory Service, Johannesburg,, South Africa, [7]University of KwaZulu-Natal, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [8]University of Pretoria, Department of Paediatrics and Child Health, Pretoria, South Africa

Background: PedMAb aims to develop a promising strategy using broadly neutralising antibodies (bNAbs) to interrupt postnatal HIV transmission via breastmilk, which still contributes significantly to paediatric HIV infections in high HIV-prevalence settings. We report on safety and pharmacokinetic (PK) data of 2 anti-HIV-1 bNAbs, CAP256V2LS and VRC07-523LS, administered concurrently to neonates for the first time at delivery and 3 months.

Methods: Forty HIV-exposed infants born without HIV (HEI) received escalating doses of either CAP256V2LS (arms 1, 2, 3: 5, 10 or 20 mg/kg) or VRC07-523LS (arms 4, 5: 20 or 30 mg/kg) subcutaneously (SC), within 96 hours from birth. Following a safety assessment and PK population analysis 8 infants (arm 6/6b) received a fixed dose of CAP256V2LS (60mg) and VRC07-523LS (90mg) within 96 hours (dose 1) and 120mg of either bNAb at 3 months (dose 2).
Infants were observed for 2-4 hours or 1 hour after each dose in arm 6/6b, and seen at days 1, 3, 14 and 28, then monthly until end of follow-up. Internal and external safety committees reviewed safety and PK data monthly and biannually, respectively.
Results: Reactogenicities at 4 hours and over the first 3 days post-dose were observed in 5/24 and 7/16 infants receiving CAP256V2LS or VRC07-523LS, respectively; and in arm 6/6b in 4/8 and 1/8 infants after dose 1 and 2, respectively. 117 Adverse Events (AEs) were reported in 24 infants receiving CAP256V2LS, 82 in 16 infants receiving VRC07-523LS; 43 and 54 AEs were reported in 8 infants of arm 6/6b after dose 1 and 2, respectively.
Overall, AEs were grade 1 or 2, except for five grade 3 and two grade 4. In arm 6/6b possibly related AEs were low absolute neutrophil count (n=5) and anaemia (n=1), and one probably related case of irritability. All infants were clinically well, and AEs resolved spontaneously.
Conclusions: CAP256V2LS and VRC07-523LS are safe when administered alone and in combination to HEI. Phase 2/3 trials are needed to investigate the efficacy of bNAbs to interrupt vertical HIV transmission, thus increasing the armamentarium against postnatal HIV transmission and creating an HIV-free paediatric population. Progress has been hampered by current global development.

Foetal growth in pregnant women living with HIV: longitudinal analysis of serial ultrasound measurements in South Africa

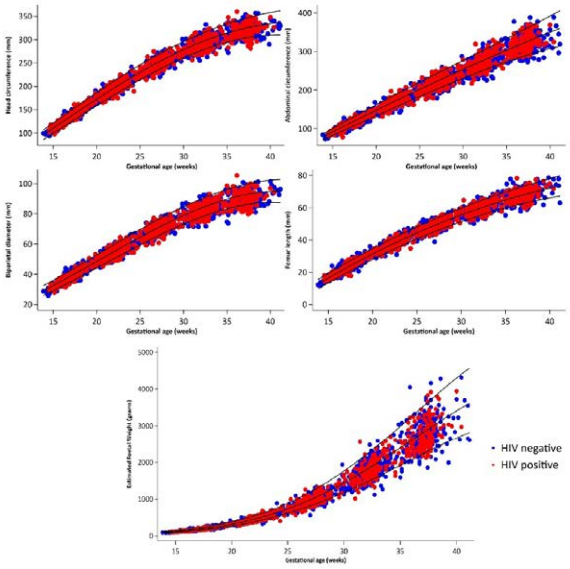
D.N.K. Darji[1], I. INTERBIO-21st Consortium[2,3], S. Norris[4], E. Ohuma[5], J. Hemelaar[1]

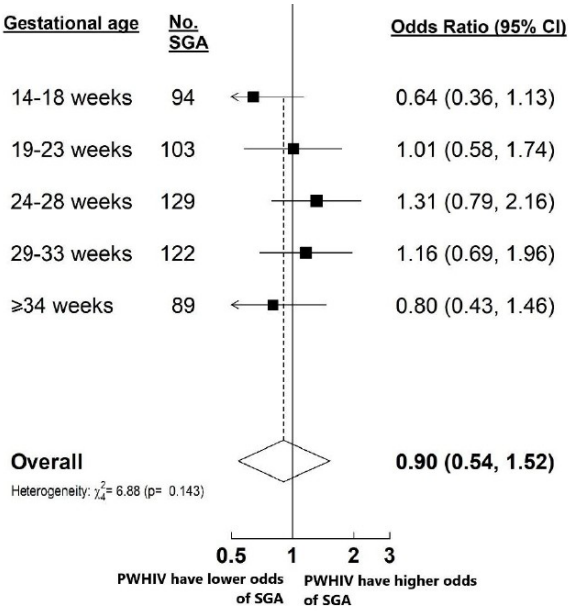
[1]University of Oxford, Nuffield Department of Population Health, Oxford, United Kingdom, [2]Oxford Maternal & Perinatal Health Institute, Green Templeton College, Oxford, United Kingdom, [3]University of Oxford, Nuffield Department of Women's & Reproductive Health, Oxford, United Kingdom, [4]University of Witwatersrand, MRC-Wits Developmental Pathways for Health Research Unit, Johannesburg, South Africa, [5]London School of Tropical Medicine and Hygiene, c Centre for Maternal, Adolescent, Reproductive, and Child Health, London, United Kingdom

Background: Pregnant women with HIV (PWHIV) are at increased risk of delivering babies that are small for gestational age (SGA). We aimed to determine the antenatal foetal growth trajectories of pregnant women with HIV (PWHIV), compared to HIV-negative women.

Methods: In a prospective pregnancy cohort study in Soweto, South Africa, in 2013-2016, serial ultrasound measurements of head circumference (HC), biparietal diameter (BPD), abdominal circumference (AC), and femur length (FL). Multivariable linear mixed effects models were used to estimate differences in mean foetal growth measures and mean foetal growth velocity increments according to maternal HIV status. Z-scores and centiles for all parameters were calculated according to the INTERGROWTH-21st standards for foetal growth. Multivariable mixed effects logistic regression was used to examine the association of maternal HIV acquisition with in-utero SGA and very SGA.

Results: Ultrasound measurements of 228 PWHIV receiving ART and 384 HIV-negative pregnant women, with a median of five antenatal ultrasound scans per women, were analysed.





There were no significant differences in mean foetal growth measures and growth velocity increments between foetuses of PWHIV and HIV-negative women. The prevalence of SGA ranged between 14.2-26.4% for PWHIV and 18.5-24.1% for HIV-negative pregnant women during different gestation windows. There was no significant association between maternal HIV acquisition and in-utero SGA or VSGA.

Conclusions: Maternal HIV acquisition treated with ART was not associated with altered foetal growth, foetal growth velocity, or in-utero SGA, compared to HIV-negative women. Our findings support international clinical guidelines recommending ART for PWHIV to improve maternal health and reduce vertical HIV transmission.

[1]London School of Hygiene and Tropical Medicine (LSHTM), Clinical Research Department, London, United Kingdom, [2]Infectious Diseases Institute, Kampala, Uganda, [3]University of Minnesota, Division of Biostatistics and Health Data Science, School of Public Health, Minneapolis, United States, [4]Mbarara University of Science and Technology, Department of Medicine, Mbarara, Uganda, [5]City St George's University of London, Institute for Infection and Immunity, London, United Kingdom, [6]University of Exeter, MRC Centre for Medical Mycology, Exeter, United Kingdom, [7]University of Minnesota, Division of Infectious Diseases and International Medicine, Department of Medicine, Minneapolis, United States, [8]London School of Hygiene and Tropical Medicine (LSHTM), Department of Infectious Disease Epidemiology and International Health, London, United Kingdom

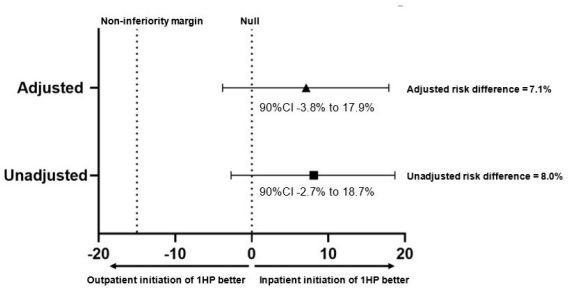
Background: Tuberculosis preventive therapy (TPT) coverage for persons with advanced HIV disease is poor. Due to advanced immunosuppression, adults with cryptococcal meningitis have 12-month mortality following hospital discharge up to 78%; tuberculosis (TB) is common and preventable, and likely contributes to poor patient outcomes. Innovative delivery strategies to increase TPT provision and uptake are needed for this high-risk population.

Methods: In this phase-3, multi-site, open-label, non-inferiority randomised controlled strategy trial, we randomised adults with HIV-associated cryptococcal meningitis and no evidence of active TB disease in a 1:1 ratio to inpatient initiation of 1HP (one month of daily rifapentine plus isoniazid) prior to hospital discharge, or outpatient initiation at 6-weeks (standard of care).

The primary end point was TB-disease free survival and 1HP treatment completion at 18-weeks, based on a 15% noninferiority margin and one-sided 95% confidence interval (CI).

Results: Of 205 randomised participants, 69.9% (72/103) with inpatient 1HP initiation had TB-disease free survival and 1HP treatment completion at 18-weeks vs. 61.8% (63/102) in the outpatient 1HP arm (adjusted risk difference 7.1% 95%CI -5.9% to 20.1%). No significant differences existed in any secondary endpoints when comparing inpatient vs. outpatient 1HP initiation, including: grade 3 or higher and serious adverse events (risk difference -2.4% 95%CI -15.8% to 11.0%); drug induced liver injury (risk difference 0.4% 95%CI -to -7.9% to 8.7%); incident TB disease (risk difference -5.4%, 95%CI -13.4% to 2.6%); and 18-week survival (adjusted risk difference 1.9%, 95%CI -8.0% to 11.8%).

Risk difference in TB disease free survival and 1HP treatment completion at 18 weeks after cryptococcal meningitis diagnosis



Conclusions: 1HP initiation prior to hospital discharge was non-inferior to outpatient initiation of amongst adults with advanced HIV disease and cryptococcosis. These data indicate that following exclusion of active TB disease, inpatient 1HP initiation is feasible and safe.

OAC01 From PrEP to harm reduction: Scaling up comprehensive HIV prevention strategies

OAC0106LB

PrEP provision in bars *vs*. primary care: a cluster RCT among 780 female bar workers in Dar es Salaam, Tanzania

Background: In many countries in Africa, adolescent girls and young women (AGYW) are disproportionally affected by HIV and may thus benefit from HIV pre-exposure prophylaxis (PrEP). Female bar workers (FBWs) are AGYW who are at particularly high risk of HIV acquisition, because they often engage in transactional sex. However, FBWs, commonly lack easy access to PrEP because of their work schedules, high mobility and stigma.

We report primary outcomes from a cluster-randomized controlled trial (cRCT) of bar-based PrEP vs. the standard-of-care, which is primary care-based PrEP for FBWs in Dar es Salaam, Tanzania.

Methods: 112 bars were cluster-randomized (cR1) to receive PrEP promotion, eligibility screening, initiation, and monthly refills in the bars *vs*. PrEP promotion in the bars but all other PrEP functions in primary care clinics, the current standard-of-care in Tanzania.

All FBWs who initiated PrEP were further individually randomized (R2) to receive *vs*. not receive adherence support through a PrEP champion. We followed up with trial participants monthly over six months, including urine-based Tenofovir disoproxil fumarate (TDF) testing at months 2 and 6.

We report the proportion of FBWs who took up, adhered to, were lost to follow-up and dropped out of PrEP in each trial arm. We used modified-Poisson regression to calculate risk ratios (RR) and 95% confidence intervals (CI). The trial was registered with the German Clinical Trials Register (DRKS00018101).

Results: Of the 1,017 FBWs in the participating bars, 780 agreed to be screened and 439 were eligible and consented to participate in the trial. When offered PrEP, initiation was 75% in the bar-based vs. 27% in the primary care-based arm (RR 2.79, 95%CI: 2.26-3.47).

Adherence, loss to follow-up, and drop-out were not significantly different between the trial arms over the follow-up period of six months.

Conclusions: Bar-based PrEP provision for FBWs substantially boosted PrEP uptake. Once FBWs received care, their adherence and retention did not differ between the trial arms. Offering PrEP in bars, and similar workplaces, should be considered as a policy in Tanzania and other countries in Africa to increase PrEP uptake among key populations in the HIV response.

OAC02 Destination zero new acquisitions: Hailing a CAB to PrEP success

Evaluating CAB-LA concentration and breastmilk transfer in postpartum PrEP: results from the Tshireletso PK substudy

M. Yoseph[1], J. Momper[2], E. Shava[1], B. Oguttu[1], K. Shambira[1], S. Silarszka[3], T. Mohammed[1], S. Moyo[1], J. Makhema[1], G. Masheto[1], C. Morroni[4,1], S. Lockman[5,1], R. Shapiro[6,1], E. Capparelli[2], R. Zash[7,1]

[1]Botswana Harvard Health Parnership, Gaborone, Botswana, [2]University of California San Diego, San Diego, United States, [3]Harvard University, Boston, United States, [4]University of Edinburgh, Edinburgh, United Kingdom, [5]Brigham and Women's Hospital, Boston, United States, [6]Harvard TH Chan School of Public Health, Boston, United States, [7]Beth Israel Deaconess Medical Center, Boston, United States

Background: Initiating long-acting cabotegravir (CAB-LA) for pre-exposure prophylaxis (PrEP) on the maternity ward after delivery is an efficient strategy to engage young women and prevent HIV in mothers and breastfeeding infants.

However, there is a paucity of data on the pharmacokinetics (PK) of CAB-LA started immediately post-partum and infant exposure through breastfeeding.

Methods: ‚Tshireletso' evaluated the implementation and safety of CAB-LA PrEP within 14 days of delivery. CAB-LA was injected IM at enrollment, 1 month, then every two months. Samples were collected just before the 1 month injection (1m), 1 week later (1m+1wk), just before the 5 month injection (5m) and 1 week later (5m+1m). Plasma and whole breastmilk concentrations of CAB were measured using a liquid chromatography-tandem mass spectrometry (LC-MS/MS) assay. Relative infant dose (RID) [estimated infant dose via breastmilk (mg/kg/day)/adult dose (mg/kg/day)] was calculated using average milk intake of 150 mL/kg/day, observed breastmilk concentrations, adult IM CAB dose (600mg q56d) and measured maternal and infant weights.

	1 month (trough) median (range)	1 month + 1 week (peak) median (range)	5 month (trough) median (range)	5 month + 1 week (peak) median (range)
Maternal Plasma CAB concentration (ng/mL)	941 (322,6980)	1980 (580,9820)	1875 (1030,3050)	2480 (1800,7080)
Breastmilk CAB concentration (ng/mL) *quantitative limit (QL) for breastmilk = <0.977ng/mL	14.6 (2.5,89)	29.8 (6.7,143)	27.4 (10.8,129)	36.1 (17.2,108)
Infant Plasma CAB concentration (ng/mL) *quantitative limit (QL) for plasma =<39ng/mL	33.2 (16 below QL, 638)	69.2 (5 below QL, 933)	85.3 (5 below QL, 226)	92.1 (1 below QL, 365)
Relative infant dose of CAB (% of maternal dose, mg/kg/day)	1.6% (0.2%,6.3%)	2.8% (0.6%,10.1%)	2.2% (1.1%,9.5%)	3.3% (1.7%,7.7%)

Table 1. Cabotegravir concentrations in maternal, infant and breastmilk samples over time after initiation of maternal CAB-LA injections for PrEP.

Results: Data from 27 lactating women and their breastfed infants with all specimens from ≥two time points were included. Median maternal plasma, breastmilk and infant plasma CAB concentrations at 1m, 1 m+1wk, 5m and 5 m+1wk were highly variable and increased over time (Table 1). Seventy-four percent of maternal CAB concentrations were >4x PA-IC90 (664ng/mL) at 1m, and all but 1 (from 1m+1wk) exceeded this threshold at all other timepoints. Median (IQR) breastmilk to plasma ratio of CAB was 1.4% (1.1%, 1.9%). Infant CAB concentrations were greater than 1x PA-IC90 (166ng/mL) in 13.7% of samples. The overall median (IQR) RID was 2.5% (1.6%, 4.5%).

Conclusions: CAB reached protective levels within 1 week after the second dose in nearly all breastfeeding mothers. Breastmilk concentrations of CAB-LA were low, with estimated median RID below the <10% threshold, and all infant levels less than 1000 ng/mL. These findings support the safety of CAB-LA use during breastfeeding, reinforcing its potential as a viable PrEP strategy in the postpartum period.

OAC04 The emerging landscape of PrEP choice

OAC0406LB

The impact of long-acting lenacapavir on adolescent girls and young women in Kenya: a mathematical modeling study

S. B. Klein[1], C. L. Hathaway[1,2], J. Heitner[1], M. Onono[3], N.R. Mugo[4,5], R. V. Barnabas[1,6,7]

[1]Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, [2]University of Washington, School of Medicine, Seattle, United States, [3]Kenya Medical Research Institute, Center for Microbiology Research, Kisumu, Kenya, [4]University of Washington, Department of Global Health, Seattle, United States, [5]Kenya Medical Research Institute, Center for Clinical Research, Nairobi, Kenya, [6]Harvard Medical School, Department of Medicine, Boston, United States, [7]Harvard School of Public Health, Department of Epidemiology, Bostonunit, United States

Background: Current oral pre-exposure prophylaxis (PrEP) for HIV has not achieved its full potential, largely due to challenges with adherence and consistent use. To improve uptake and effectiveness, alternative delivery methods are needed. Lenacapavir, a long-acting injectable administered twice yearly, offers a promising solution.

We used modeling to assess the potential impact of lenacapavir on HIV outcomes among high-risk adolescent girls and young women (AGYW) in Kenya.

Methods: We used a deterministic transmission-dynamic compartmental model of HIV infection calibrated to Kenya to simulate PrEP implementation scenarios. Oral PrEP, introduced in 2018, was assumed to be used exclusively by HIV-negative girls aged 15–24 at high risk (≥5 partners/year) reaching 4.6% coverage by 2025.

Starting in 2026, we assumed a national switch in Kenya to long-acting injectable lenacapavir with 5 possible trajectories: (1) maintaining 2025 coverage levels, or increasing to (2) 15%, (3) 30%, (4) 45%, or (5) 57% coverage by 2030.

We also modeled a comparator scenario in which there is no switch to lenacapavir and no scale-up beyond 2025 oral PrEP coverage levels. Oral PrEP was assumed to be 75% effective and lenacapavir 100% effective in preventing HIV infection. We assessed the median and interquartile range (IQR) of new HIV cases and cumulative cases averted over 30 years across the 25 best-fitting parameter sets.

Results: The greatest impact of lenacapavir among AGYW was observed at higher coverage levels. At 57% coverage, lenacapavir was estimated to avert 11,904.93 (9,293.73 -17,027.33) new HIV cases, representing an 18.82% (18.34%–19.62%) reduction compared to oral PrEP.

However, switching to lenacapavir alone without scaling up coverage had minimal effect—at 4.6% coverage, the percent reduction in HIV acquisition was only 0.58% (0.57%–0.61%). A modest increase to 15% coverage averted 2,974.52 (2,322.97 - 4,274.46) HIV cases, while scaling to 30% averted approximately 6,445.65 (5,036.58 - 9,248.84) cases.

Conclusions: These results emphasize the importance of not only transitioning to long-acting PrEP but also expanding coverage to achieve meaningful reductions in HIV incidence among AGYW. Lenacapavir has the potential to significantly reduce the burden of HIV among adolescent girls and young women if coverage can be effectively scaled up.

OAD0106LB

Effectiveness of the TENDAI integrated therapy for depression and adherence to HIV medication delivered by lay adherence counsellors in Zimbabwe: results from a randomized controlled trial.

T. Bere[1], C. O'Cleirigh[2], K. Goldsmith[3], P. Nyamayaro[1], R. Jopling[4], S. Cross[3], S. Marquez[2], P. Ganguli[4], A. Stanton[5], D. Gudyanga[1], J. Lee[2], D. Chibanda[1], S. Safren[6], B. Barrett[4], W. Mangezi[1], M. Abas[7]

[1]University of Zimbabwe, Mental Health Department, Harare, Zimbabwe, [2]Massachusetts General Hospital, Behavioral Medicine Program, Department of Psychiatry, Boston, United States, [3]King's College London, Department of Biostatistics & Health Informatics, London, United Kingdom, [4]King's College London, Health Service and Population Research Department, London, United Kingdom, [5]Boston University, Dept. of Psychological & Brain Sciences,, Boston, United States, [6]University of Miami, Center for HIV and Research on Mental Health, Miami, United States, [7]King's College London, Centre for Global Mental Health, London, United Kingdom

Background: Depression increases the risk that people will have poor adherence to antiretroviral therapy (ART) and HIV viral non-suppression. It is unknown if psychological interventions delivered by lay counsellors can improve mental health and HIV outcomes.

We conducted a 2-arm parallel-group randomized controlled trial testing whether the TENDAI psychological intervention was effective for addressing viral non-suppression, depression, and ART adherence.

Methods: 280 adults living with HIV aged ≥18 years with probable depression (Patient Health Questionnaire, PHQ-9, ≥10) and viral non-suppression (≥1000 HIV copies per ml) were recruited from rural and urban clinics in Zimbabwe and randomized. People in the intervention arm received TENDAI, a culturally adapted 6-session problem-solving and motivational intervention, combining depression treatment with focus on adherence, delivered by lay adherence counsellors.

People in the control arm received enhanced usual care (EUC). TENDAI versus EUC comparisons were estimated using logistic regression (viral suppression), linear mixed-effects models (PHQ-9 and Wilson self-report adherence), and generalized estimating equations (GEE) logistic regression (second-line ART use, a post hoc outcome). Cost-effectiveness was estimated using Quality-Adjusted Life-Years (QALYs) derived from the EQ-5D-5L.

Results: Retention at 12 months was 91%. PHQ-9 depression scores were 4.3 points lower in the TENDAI arm compared to EUC at 4 months (95% CI -5.4, -3.2, p<0.001) and 2.2 points lower at 12 months (95% CI -3.3, -1.2, p<0.001). Self-reported adherence was significantly higher in the TENDAI arm at 4 months (mean difference 5.2 points, 95% CI 2.5, 7.9, p<0.01) and at 12 months (mean difference 4.2 points, 95% CI 1.2, 7.2, p<0.01).

There was no significant difference in viral suppression between TENDAI and EUC arms. However, TENDAI participants had 70% lower odds of being prescribed second-line ART at 12 months (OR 0.3, 95% CI 0.1, 0.7, p<0.01). QALYs were significantly higher, and costs lower, in the TENDAI arm, providing evidence of cost-effectiveness.

Conclusions: This is the first trial demonstrating that an intervention delivered by lay adherence counsellors achieved sustained improvements in depression symptoms and self-reported adherence. People receiving TENDAI were more likely to remain on first-line ART. These promising results, including favorable cost-effectiveness, support implementing TENDAI in routine HIV care in low-resource settings.

OAD02 Health equity in challenging times: Threats and opportunities

OAD0206LB

Redressing resource inequities and advancing the right to health: a rights-based approach to HIV, TB and STI service access in South Africa

M. Mbasa[1]

[1]Civil Society Forum, People Living with HIV, Johannesburg, South Africa

Background: Section 27(1) of the South African Constitution guarantees every person the right to access healthcare services, including reproductive health services. Yet systemic inequities, especially in public health financing, supply chain continuity and service delivery persist as structural barriers. With 87% of the population reliant on an underfunded public system that receives less than half of the national health budget, rights violations are entrenched.

This abstract presents lessons from community and civil society-led initiatives advocating for equitable access to HIV, TB and STI services through a human rights-based lens.

Description: This analysis draws on qualitative inputs from multisectoral advocacy meetings, service delivery audits, and structured community dialogues conducted between 2022 and 2024 across five under-resourced districts in South Africa. Facilitated by coalitions of civil society, healthcare users and frontline providers, the dialogues explored gaps in supply chains, viral load monitoring, medicine stockouts and systemic delays in clinical service delivery.

These findings were triangulated with public expenditure data and civil society-led shadow budget reviews, emphasizing youth, key populations and people living with HIV.

Lessons learned: Persistent underfunding and fragmented planning in public health have undermined HIV/TB/STI service delivery, particularly affecting continuity of ARV supply and viral load monitoring. Disparities in healthcare financing where 51% of expenditure benefits only 14% of the population have deepened inequality. Community-led monitoring exposed critical data gaps, while civil society advocacy pushed for greater accountability in budget allocation. Deprivation-linked stigma further alienates vulnerable groups from accessing care. Yet, community organizations remain underfunded, threatening the sustainability of their work.

Conclusions/Next steps: A human rights-based health response must include structural reforms to financing, improved transparency, equitable resource distribution, and integration of deprived communities into planning processes.

Scaling community-led accountability, policy advocacy, and investment in grassroots actors are essential to make rights to health not only aspirational but real. Public-private parity in resource allocation must be central to closing the treatment gap.

OAD03 Innovative community approaches to HIV prevention, care and rights

OAD0306LB

Enhancing PrEP uptake through stigma reduction: results from the PrEPUp! quality improvement collaborative in Malawi

S. Likumbo[1], E. Moses[2], M. Enock[2], G. Kawalazira[3], Y. Kamgwira[4], D. Kasale[4], R. Birchard[5], D. Hoege[6], S. Allinder[7], C. Holmes[7], J. Murungu[8], B. Agins[9]

[1]Blatyre District Health Office, Blantyre, Malawi, [2]HEALTHQUAL, University of Carolina San Francisco, Lilongwe, Malawi, [3]Blantyre District Health Office, Blantyre, Malawi, [4]Malawi National Aids Commission, Blantyre, Malawi, [5]HEALTHQUAL, University of Carolina San Francisco, San Francisco, United States, [6]Georgetown University, Centre for Innovation in Global Health, New York, United States, [7]Georgetown University, Centre for Innovation in Global Health, Washington DC, United States, [8]HEALTHQUAL, University of Carolina San Francisco, Harare, Zimbabwe, [9]HEALTHQUAL, University of Carolina San Francisco, New York, United States

Background: While stigma toward People Living with HIV (PLHIV) is well documented, limited research addresses stigma associated with pre-exposure prophylaxis (PrEP). As part of a quality improvement collaborative (QIC) within the Blantyre Prevention Strategy, PrEPUp! implemented provider and client assessments of PrEP-related stigma and identified drivers of low uptake to inform targeted quality improvement (QI) interventions.

Methods: An 11-item standardized tool, developed by Blantyre Department of Health and UCSF HEALTHQUAL, assessed domains including privacy, respect, clinic environment, fear of HIV labeling, and PrEP decision-making. Sample sizes for nine public facilities were calculated based on outpatient volume, with systematic sampling used to select participants. Hospital ombudsmen and

Health Surveillance Assistants administered surveys using REDCAP. QI coaching facilitated data use for design of stigma-reduction strategies.

Results: Between June–December 2024, 797 clients (64% of projected sample) completed the survey. Most clients reported comfort discussing PrEP with providers (91%) and no discrimination from providers or staff (91%). However, 89% were counselled to be monogamous, 22% had to initiate PrEP discussions themselves, and 17% feared stigma associated with PrEP use. All clients described clinics as welcoming and providers as respectful; nevertheless, 10% reported receiving inadequate health information. Significant variation was observed across facilities related to routine offering of PrEP.

Conclusions: Findings reveal persistent stigma and inconsistent PrEP service delivery in Blantyre. While many facilities offer supportive environments, many patients are required to initiate PrEP discussions and monogamy is promoted, reflecting ongoing need for provider sensitization to enhance patient engagement.

Interventions are needed to standardize offering of PrEP within public health facilities; stigma-related barriers need to be addressed. Embedding stigma reduction within QI processes offers a practical approach to reducing stigma and strengthening PrEP uptake.

OAD04 Climate change, mobility and HIV

OAD0406LB

The intersection of climate change and health: investigating the association of drought and HIV prevalence in Kenya

G. Kangogo[1], T. Loux[2], K. Li[2], M. Teni[2], K. Trout[1], E. Shacham[3]
[1]University of Missouri, Department of Health Sciences, Columbia, United States, [2]Saint Louis University, Department of Epidemiology and Biostatistics, Saint Louis, United States, [3]Saint Louis University, Department of Behavioral Science and Health Equity, Saint Louis, United States

Background: The intersection of climate change and public health, including the impacts of droughts, floods, high temperatures, and migration, is a critical yet underexplored area, particularly in the context of HIV/AIDS. Limited findings have associated droughts with adverse health outcomes and disruptions to public health programs.

The aim of this study was to examine the relationship between climate-induced droughts and HIV prevalence in Kenya.

Methods: This study utilized nationally representative data including biomarker testing for participants from the 2019 Kenya Population-Based HIV Impact Assessment (KENPHIA) survey. Drought conditions were quantified using precipitation data from the Climate Hazards Group InfraRed Precipitation with Station Data (CHIRPS). The association between drought and HIV prevalence as measured by biomarker testing was analyzed using weighted binary logistic regression models, accounting for the complex survey design and weights.

Results: The analysis included 31,032 participants examining sociodemographic factors, sexual behaviors, and climate variables. Nearly half of the respondents (47.2%) had experienced drought.

The majority of participants who tested positive for HIV (58.2%) resided in drought-affected areas compared to those in non-drought areas. Those who resided in drought-affected areas had significantly higher odds of testing positive compared to those who had not experienced drought.

High-risk sexual behaviors such as transactional sex and intergenerational partnerships were significantly associated with HIV prevalence. Lower educational attainment and food insecurity were significantly associated with increased odds of testing positive for HIV.

Conclusions: We found that participants who had experienced droughts were more likely to test positive for HIV. This may be because droughts exacerbate socio-economic vulnerabilities, such as food insecurity and migration, which can increase high-risk behaviors and reduce access to healthcare services.

In light of this, these findings underscore the compounded risks of climate change on public health, emphasizing the need for integrated strategies that address both climate adaptation and HIV prevention.

OAD05 "I will not lower my voice": Experiences from trans and gender-diverse communities

OAD0506LB

Mpox awareness and access barriers among transgender and intersex communities in Kenya

C. Njuguna[1]
[1]ALISON, Nairobi, Kenya

Background: In early 2025,Kenya confirmed Mpox cases across multiple conties. Mpox is rarely discussed in the context of gender diverse communities. Transgender and intersex communities already facing systemic stigma and healthcare discrimination were potentially at high risk due to overlapping vulnerabilities and limited access to accurate health information.

This project is aimed to assess Mpox knowledge and health seeking behaviour among these populations.

Description: Around February to March 2025, series of grassroot led Mpox sensitisation session were conducted in Nairobi's informal settlements targeting transgender and the intersex persons.

Activities included peer led group discussions, one on one outreach both in person and digital platforms. Special attention was given to correcting misinformation, recog-

nising Mpox symptoms and how different they are to the other health conditions and addressing barriers to seeking care particularly fear of judgement and prior negative experiences in health facilities.

Lessons learned: After the surveys it was revealed that 85% of the participants had never received Mpox related information and many confused with other skin related conditions common among people living with HIV. Intersex too expressed heightened fear due to social invisibility and legal misrecognition despite Kenya's 2022 legal recognition of intersex as a gender. Peer led education improved trust significantly, knowledge uptake and willingness to discuss symptoms openly. However, access to Mpox screening and referrals through county level outreaches remains limited and were often perceived as unsafe due to integration with general services.

Conclusions/Next steps: Community specific Mpox interventions must be integrated into national health responses using rights based and inclusive frameworks. Health workers need training on gender diversity to reduce stigma in service provision.

Future steps include scaling up safe space outreaches, decentralising Mpox information materials and including the transgender and intersex voices in preparedness planning and surveillance efforts.

OAD06 Harnessing technology: Digital health applications

OAD0606LB

Co-designing trust: community voices in building an AI companion for HIV prevention

S. Cooper[1], S. Frade[2], N. Maricich[2], R. Mendonca[1], S. Morris[1], C. Govathson[3], A. Spyrelis[4], S. Stafford[4], P. Matambanadzo[5], S.T. Chabata[5], S. Musemburi[5], B. Chingombe[5]

[1]Audere, Seattle, United States, [2]Audere Africa, Johannesburg, South Africa, [3]HE2RO Indlela, Johannesburg, South Africa, [4]Shout-It-Now, Johannesburg, South Africa, [5]CeSHHAR, Harare, Zimbabwe

Background: Adolescent girls and young women (AGYW), Female Sex Workers (FSW), and individuals who sell sex but do not self-identify as sex workers (i.e. on the edge of sex work (EoSW)) in southern Africa face persistent barriers to HIV prevention and care. Digital health solutions using artificial intelligence (AI) offer promise, but their effectiveness depends on user trust, relevance, and meaningful engagement.

This abstract shares formative and summative findings from the participatory design and testing of the "Self-Care from Anywhere" (SCFA) Companion—an AI-powered conversational tool co-created with AGYW, FSW, and EoSW to support HIV prevention and care, and explores how a priority populations'–driven design process contributed to an accessible, trustworthy, and engaging tool.

Description: In South Africa, co-design included structured focus groups with AGYW during a workshop, followed by informal conversations and mini-feedback sessions at mobile service points, such as clinics. These engagements validated concepts and informed refinements to content, tone, and features. Insights from both phases guided iterative usability testing.

Summative methods included structured observations and usability surveys with 90 AGYW aged 15–24. In Zimbabwe, a two-day workshop worked with FSW, EoSW, clinicians, peer microplanners, and government officials to inform early-stage design for EoSW and FSW. At both sites, participants shaped chatbot tone, content, language, and privacy features.

Lessons learned: Co-design through interactive workshops and real-time prototype engagement led to significant improvements in design and functionality. In South Africa, repeated feedback loops refined tone, navigation, and privacy features (e.g., emojis, fake names), contributing to a System Usability Scale score of 88.1. In Zimbabwe, early engagement identified core needs like local language support and stigma-free referrals. Importantly, co-design extended beyond initial development.

Continuous monitoring and updates based on user interactions continue to enhance usability and trust. This ongoing co-design approach now includes live demos, embedded feedback capture, and localized content updates as standard practice.

Conclusions/Next steps: Sustained, inclusive co-design is essential for digital tools that resonate. There is strong demand for trusted, context-aware AI companions sup-

porting HIV and SRH. Next steps include ongoing feedback loops, engagement tracking, regional language support, and adapting workflows to diverse contexts.

OAE01 Advancing equity in the HIV response: Key populations, human rights and quality intervention

OAE0106LB

Empowering young female sex workers in coastal Kenya: a community-led approach to HIV prevention through peer education and digital reminders (2023–2024)

R. Gachiri[1], S. Kamiri Thuo[2]
[1]KANCO, Programs, Nairobi, Kenya, [2]Kenya Red Cross Society, Global Fund Program Unit, Nairobi, Kenya

Background: In Kenya's coastal counties of Mombasa, Kwale, and Kilifi, young female sex workers (YFSWs) are at high risk for HIV/AIDS due to stigma, economic instability, and limited healthcare access. In 2023, a strategic initiative integrated digital health systems with peer-led programs.

The new platform includes a calendar for quarterly screening reminders and facilitates ongoing peer education, aiming to improve healthcare access and continuity for high-risk groups.

Description: The initiative helped young female sex workers (YFSWs) access HIV prevention services through a digital platform that sent quarterly screening reminders, addressing forgetfulness and logistical barriers. Peer educators provided ongoing education via messaging apps on topics like condom use and PrEP, fostering trust and engagement. Support networks allowed YFSWs to connect and share experiences, empowering them in managing their health and promoting sustainable health-seeking behaviors.

Lessons learned: The integration of digital tools with peer-led HIV prevention strategies has significantly benefited young female sex workers (YFSWs) in Kenya's coastal counties, particularly Mombasa, Kwale, and Kilifi. By the end of the program, over 78% of YFSWs accessed HIV testing regularly, and 60% reported consistent condom use.

A digital reminder system improved health screening adherence, with peer educators using WhatsApp and Facebook to provide culturally relevant education, leading to an 80% increase in knowledge about HIV prevention.

However, challenges in digital access remained, as only 80% had reliable mobile data, despite 98% owning phones. Collaboration with local health systems was crucial, resulting in 85% of YFSWs receiving effective referrals to clinics for follow-up care, highlighting the effectiveness of combining digital tools with health services.

Conclusions/Next steps: This peer-led, digitally enabled approach has improved HIV prevention among young female sex workers by enhancing service continuity and community engagement. Mobile reminders and peer education have increased access to health services and reduced stigma.

Future goals include scaling the model, improving digital access, and expanding engagement in various spaces. Real-time data systems will aid responsive programming. With ongoing funding, this model is a cost-effective strategy for equitable, community-led HIV prevention, contributing to efforts to end AIDS as a public health threat.

OAE02 No retreat, no surrender: Sustaining the HIV response in times of turmoil

OAE0204LB

Assessing the impact of USG funding cuts on Zambia's HIV programming: a retrospective review of PrEP and VMMC uptake (2024–2025)

M. Silondwa[1], B. Longwe[1], C. Phiri[2], M. Mulenga[1], A. Mwamelo[1], J. Drakes[3], D. Resar[3], P. Haimbe[1], H. Shakwelele[1], L. Mulenga[2]
[1]Clinton Health Access Initiative, Lusaka, Zambia, [2]Ministry of Health, Lusaka, Zambia, [3]Clinton Health Access Initiative, Boston, United States

Background: Zambia has made strides in reducing the HIV burden with incidence having declined from 0.61% in 2016 to 0.31% in 2021 among the general population aged 15-49 years (ZAMPHIA).

Zambia's commitment to curb HIV has seen roll-out of programs such as Voluntarily Medical Male Circumcision (VMMC), oral and injectable Pre-exposure prophylaxis (PrEP). These programs have expanded rapidly largely due to the support from the United States Government (USG). This analysis assesses the impact of USG funding disruptions on PrEP and VMMC in Zambia.

Description: A retrospective analysis of secondary data from DHIS2, the Ministry of Health's national data system, was conducted to assess uptake in oral PrEP and VMMC services, comparing Q1 2024 to Q1 2025.

The analysis focused on quarterly changes in uptake across geographies with cross-tabulations and trend analysis used to identify performance implementation gaps and emerging patterns.

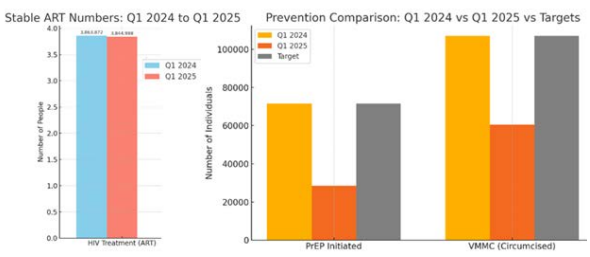

Figure.

Lessons learned: The HIV treatment program showed stability compared to the sharp declines in prevention. Between January-March 2024 and the same period in 2025, the number of individuals on ART declined marginally by just 0.5% (from 3,863,872 to 3,844,998).

In contrast, oral PrEP initiations dropped from 71,608 in Q1 2024 to 28,230 in Q1 2025, a 60.6% decrease. This performance was 51% below the quarterly target of 58,120. VMMC services saw a similar drop from 107,034 individuals in Q1 2024 to 60,546 in Q1 2025, a 43.4% decline, achieving just 49.5% of the quarterly target of 144,589.

Conclusions/Next steps: USG funding cuts have disrupted Zambia's HIV prevention programs, particularly in USAID-supported provinces, leading to reduced uptake of PrEP and VMMC, threatening broader epidemic control. Urgent action is needed to assess the full impact of the disruptions to inform government-led efforts to sustain services through domestic resource mobilization, reprioritization to ensure continuity, and robust monitoring systems to build resilience against external shocks

OAE0205LB

From vertical to domestic: transition readiness of National HIV responses in 14 countries in Africa

S. Kilonzo[1], The HIV Leadership Forum- a community of practice of Director Generals of AIDS Commissions
[1]*Yemaya Health Group, Nairobi, Kenya*

Background: Following the halt of U.S. government funding in January 2025, the HIV Leadership Forum—comprising Director Generals of 40 national AIDS commissions—conducted a rapid transition readiness survey across 24 sub-Saharan African countries to gauge service continuity, systems resilience and available transition assets. Fourteen countries (58%) responded by mid-April, via a 46-indicator Microsoft-Forms assessment, analyzed descriptively in Excel.

Description: *Service-delivery:* All countries reported operational public-health facilities and governments quickly integrated antiretroviral (ART) dispensing into OPD departments. PMTCT services remained functional in 83% of nations. However, 75% of NGO/community sites closed, disrupting 90% of prevention programs.

Systems: All countries reported data interruptions in facility and national health information tied to NGO-managed servers or licenses. ART client transfers occasionally occurred without records. Laboratory networks faced similar vulnerabilities.

Commodities: While 65% of countries had nine-month ARV and testing commodity stocks, half held <6-months of prevention-specific ARVs or condoms. Supply chain disruptions varied, though 8 countries indicated internal distribution breakdowns.

Human Resources: Donor-funded staff attrition totaled 123,668 across 12 countries, including 60% frontline clinical workers (nurses, doctors, lab staff) and 44,502 community volunteers. Contractual complexities hindered retention efforts.

Governance: Governments issued service-continuity directives, repurposing HIV clinics and initiating domestic funding. Countries with partial control over procurement, logistics, and data systems experienced milder disruptions.

Transition assets identified: embedding HIV services in universal health coverage schemes, leveraging private/faith facilities for co-payment models, expanding data interoperability, aligning community-social services, and strengthening AIDS commissions stewardship.

Lessons learned: Decades of significant HIV systems investments collapsed, underscoring the fragility of donor-dependent structures and the protective role of integrated national platforms. Public facilities struggle with sudden ART client influxes amid system disruptions. The attrition of 60% frontline health workers risks care quality, while prevention collapses demand urgent cross-sector models targeting at-risk populations. Reported commodity stocks are residual from pre-January shipments, thus, urgent domestic investments are needed.

Conclusions/Next steps: Governments demonstrated rapid adaptation and now transition stewardship is required. Immediate priorities include: ecosystem audits to resolve client data gaps; revised commodity forecasts reflecting new client distributions; redesigned, cross-sector prevention models; partnerships with PLHIV networks and private sector; workable HR retention solutions; and sustained political advocacy for domestic resources

OAE03 Zero AIDS-related deaths: Scaling up advanced HIV disease response

OAE0306LB

Examining unmet PrEP need and PrEP equity among young people using pooled data from three African countries, October 2023-September 2024

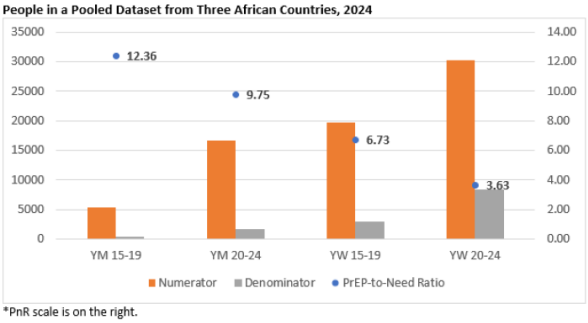
S. Wallach[1,2], W. Reidy[1,2], R. Fayorsey[2], J. Franks[3,2], S. Saito[1,2]
[1]*Mailman School of Public Health, Columbia University, Department of Epidemiology, New York City, United States,*
[2]*ICAP - Columbia University, New York City, United States,*
[3]*Mailman School of Public Health, Columbia University, Department of Sociomedical Sciences, New York City, United States*

Background: HIV disproportionately affects young women (YW) compared to men (YM) ages 15-24 in eastern and southern Africa (ESA), with YW incidence 2-4 times that of YM. To examine HIV pre-exposure prophylaxis (PrEP) access relative to need for young people, we measured PrEP-to-Need (PnRs) and PrEP Equity Ratios (PER) pooled across three countries in ESA.

Methods: We used aggregate data from 345 ICAP-supported facilities, October 2023-September 2024. PnR numerators reflect PrEP access and denominators approximate PrEP need; lower PnRs indicate more unmet need. PERs assess equity of PrEP access relative to need between groups, with PER=1 indicating equity. PnRs were operationalized using PEPFAR monitoring and reporting indicators as [annual PrEP_NEW (new PrEP initiations) + Q1 PrEP_CT (PrEP continuations)]/annual HTS_TST_POS (new HIV diagnoses) disaggregated by sex and age. PERs were PnRs for YW divided by YM and 20-24 divided by 15-19.

Results: YW PnRs (15-19: 6.73; 20-24: 3.63) were lower than YM's (15-19: 12.36; 20-24: 9.75) suggesting YW had less PrEP access relative to need. The sex PER=0.42, demonstrating a 58% gap in PrEP access relative to need for YW compared to YM. PnRs were lower for 20-24-year-olds compared to 15-19-year-olds, suggesting less PrEP access relative to need in this older group. The age PER=0.63, demonstrating a 37% gap in PrEP access relative to need for 20-24-year-olds compared to 15-19-year-olds.
While YW PrEP access (PnR numerator) was greater for each age group, the larger YM PnRs were driven by lower new HIV diagnoses (denominator). Larger 15-19 PnRs were also driven by lower new diagnoses.

Figure 1. PrEP-to-Need Ratios and PrEP-to-Need Ratio Numerators and Denominators for Young People in a Pooled Dataset from Three African Countries, 2024



*PnR scale is on the right.

Conclusions: In this pooled data, YW have 58% less PrEP access relative to need than YM, and 20-24-year-olds had 37% less PrEP access relative to need than 15-19-year-olds. We recommend increased efforts to provide PrEP for YW and 20-24-year-olds. PnRs and PERs are important metrics for evaluating PrEP scale-up.

Methods: *PrEPared to Choose* (PtC) is a phase 3b study nested within the *FASTPREP* implementation study in Cape Town, South Africa. It evaluates uptake of oral pre-exposure prophylaxis (tenofovir disoproxil fumarate/emtricitabine), the dapivirine vaginal ring, and CAB-LA among AGYW aged 15–29 years and their male partners. At enrolment, participants selected one of the available PrEP options. BMI was measured at baseline to guide CAB-LA needle selection (21G, 2-inch for BMI ≥30; 23G, 1.5-inch for BMI <30). BMI was categorised using WHO definitions and described by age, sex, and PrEP choice. Among participants who received ≥2 CAB-LA doses, mean BMI change over seven months was calculated. Multivariate regression was used to assess associations between baseline BMI and PrEP choice, and to evaluate BMI change over time.
Results: Over half of participants (56%, 657/1,164) were overweight or had obesity at baseline (BMI ≥25 kg/m²), including 30% classified as having obesity (BMI ≥30 kg/m²). Among those with elevated BMI, 76% were female and 81% were under 29 years of age.
The proportion of female participants increased with obesity severity: 74% in class I, 87% in class II, and 93% in class III. Baseline BMI was not associated with PrEP product choice (aOR 1.23; 95% CI: 0.76–2.01). Among 612 participants who received at least two CAB-LA doses, mean BMI decreased slightly over seven months (mean change -0.021; 95% CI: -0.034 to -0.009; p=0.001), while no meaningful change was observed in those who received fewer or no doses.
Conclusions: Short-term CAB-LA use was not associated with weight gain. The high baseline burden of obesity underscores the opportunity to integrate obesity care into HIV prevention platforms.

OAE04 Accelerating integration in a new operating environment

OAE0406LB

Investigating adolescent-friendly HIV prevention platforms as novel spaces for obesity interventions

C. Pike[1], C. Bondarchuk[2], K. Lebelo[1], E. Rousseau[1], P. Macdonald[1], P. Mapukata[1], L.-G. Bekker[1], N. Chandiwana[1]
[1]Desmond Tutu Health Foundation, Woodstock, South Africa, [2]Harvard Medical School, Boston, United States

Background: South Africa has built strong youth-focused HIV prevention platforms through sustained investment. In contrast, research and services addressing obesity remain limited despite rapidly rising rates, particularly among adolescent girls and young women. This overlap presents an opportunity to leverage HIV prevention platforms for integrated interventions addressing both HIV and obesity.
We describe the baseline prevalence of obesity in a real-world PrEP programme for young people and evaluate the short-term impact of long-acting cabotegravir (CAB-LA) on body mass index (BMI).

OAE06 Revolutionizing HIV: AI, equity and the next frontier

OAE0606LB

Building a safe, accurate AI companion: lessons from the Field

S. Morris[1], N. Maricich[2], S. Frade[2], R. Mendonca[1], S. Cooper[1], A. Spyrelis[4], S. Stafford[4], D. Simpson-Cupido[1], D. Jaravani[1], N. Moremi[1]
[1]Audere, Seattle, United States, [2]Audere Africa, Johannesburg, South Africa, [3]Shout-It-Now, Johannesburg, South Africa, [4]CHAPS, Johannesburg, South Africa

Background: "Self-Care from Anywhere" (SCFA), a multimodal AI tool including large language models (LLMs) and computer vision, is now in the hands of adolescent girls and young women (AGYW) in South Africa. This marks a milestone in a region where stigma, multilevel barriers, and high HIV burden challenge traditional prevention strategies. As similar tools emerge, early field learnings from the SCFA Companion offer valuable insights into performance and value of AI as an efficient way to provide services in an era of drastically shrinking resources for HIV prevention.

Description: SCFA delivers private, on-demand HIV support to AGYW through an AI-powered WhatsApp chatbot that conducts risk assessments and provides tailored education, self-testing guidance, relationship advice, and seamless connection to real clinicians—reducing stigma and closing access gaps. A clinician-facing portal supports care with AI-verified test results,, and outreach tools. The platform was developed through cross-organizational collaboration and supported by human-in-the-loop review, and is designed to be scalable, customizable, and interoperable with existing digital systems. Evaluation areas include youth engagement and priority topics; clinical accuracy and local relevance of LLM outputs; AI-generated, data-rich handoffs to clinicians when needed; clinical support utility; the feasibility of using structured data for ML-based HIV risk models; and early cost-per-interaction analysis.

Lessons learned: Preliminary results show that built-in mechanisms effectively limited AI-generated inaccuracies, though hallucination rate data are still under analysis. Safety triggers were successful in identifying and addressing potentially harmful content. RAG functionality and the inclusion of slang understanding enhanced responsiveness and contributed to contextual accuracy, though further refinement is ongoing.

Third, clinician feedback highlighted that AI-generated summaries and test verification improved triage, though handoff processes between the chatbot and clinician will benefit from further streamlining, as many client requests for a human could have been handled by the chatbot.

Ongoing costs are outweighed by benefits of user trust, interaction quality that provides greater access to care.

Conclusions/Next steps: This early deployment underscores the promise of AI tools like the SCFA Companion as scalable, cost-effective innovations for HIV prevention. Ongoing work will refine safety, accuracy, engagement and adaptability features while evaluating long-term performance and economic outcomes.

OAS0102LB

The impact of the U.S. funding interruption on HIV services and the HIV epidemic in Mozambique

D. Moiana Uetela[1], O. Tiberi[2], R. Muleia[3], P. Ramgi[4], Y. Paulo[2], I. Gaspar[2], N. Scott[5], R. Martin-Hughes[5], N.K. Martin[6]

[1]Instituto Nacional de Saude, Research Program on Diseases with Major Health Impact, Marracuene, Mozambique, [2]Ministry of Health, National STI-HIV/AIDS Control Program, Maputo, Mozambique, [3]Instituto Nacional de Saude, Division of Surveys and Health Observation, Marracuence, Mozambique, [4]Instituto Nacional de Saude, Health and Wellbeing Research Division, Marracuene, Mozambique, [5]Burnet Institute, Melbourne, Australia, [6]University of California San Diego, Department of Medicine, Division of Infectious Diseases and Global Public Health, San Diego, United States

Background: Mozambique has the 8th highest global HIV prevalence. ART is available in 97% of health facilities and serves approximately 2.1 million of the 2.4 PLHIV. However, the country relies heavily on external funds to ensure HIV service provision, with the U.S. covering approximately 93% of the country's expenses, mainly through PEPFAR. In January 2025, the U.S. government issued an executive order suspending almost all foreign aid programmes for 90 days.

We aimed to assess the impact of this order on HIV service provision and predict the impact of potential fund interruption on the HIV epidemic in Mozambique.

Methods: To evaluate the impact of the executive order on HIV service provision, we used the country's district health information system to compare selected health services indicators in February 2024 and February 2025. We analysed the absolute variation and relative change in ART initiation and viral load cascade performance in these time points.

To predict the impact on the HIV epidemic, we used a published dynamic HIV transmission and disease progression model (Optima) calibrated to Mozambique data to compare the trend before January 2025 to a counterfactual scenario with funding interruption, assuming a stagnation in the scenario observed in February 2025. We simulated the impact of funding interruption on HIV incidence and HIV-related mortality until 2030.

Results: Comparing February 2024 to 2025, there was a 25% reduction in ART initiation in adults (>=15 years), from 22,865 to 17,105. Among those on treatment, there was a 38% reduction (37,010) in viral load tests performed, a 37% reduction (27,656) in test results received, and a 33% reduction (22,043) in viral suppression.

In children (<15 years), these indicators were 44%, 71%, and 43%, respectively, showing a disproportionate impact on paediatric population.

The funding interruption was estimated to cumulatively increase 90,522 (23% more than the status quo) new HIV infections and 28,631 (33%) HIV-related deaths by 2030.

Conclusions: The findings highlighted the immediate negative impact of the U.S. funding freeze on HIV service outcomes and the potential alarming effect on the HIV epidemic, in case the funding interruption is sustained. Funding is urgently needed to mitigate these negative impacts.

OAS0103LB

Modelling the impact of cuts in PEPFAR funding for HIV pre-exposure prophylaxis among key populations in sub-Saharan Africa

J. Stone[1], K. Kipkoech[1], A. Artenie[2,1], R. Silhol[3], M.-C. Boily[3], J. Ratevosian[4], C. Beyrer[4], P. Vickerman[1]
[1]University of Bristol, Bristol, United Kingdom, [2]Université de Montréal, Montreal, Canada, [3]Imperial College London, London, United Kingdom, [4]Duke University, Durham, United States

Background: In January 2025, the US government issued a directive, pausing all foreign aid programmes. This included a 90-day pausing of all US President's Emergency Plan for AIDS Relief (PEPFAR) funding for HIV pre-exposure prophylaxis (PrEP) except for pregnant women, with a return to funding for key populations (KPs) looking increasingly pessimistic. We estimated the impact of a funding pause for PrEP among KPs in Sub-Saharan Africa (SSA).
Methods: We developed a HIV transmission model incorporating PrEP, parameterised using systematic reviews of population size estimates, HIV prevalence and incidence. We used PEPFAR reporting on numbers of each KP returning for PrEP in Jul-Sep 2024 as the estimated number using PrEP provided by PEPFAR. For each country and KP, we estimated the proportion of HIV-negative KPs receiving PrEP through PEPFAR and modelled the relative and absolute increase in new HIV infections resulting from removing this PrEP over the next year.
Results: By late 2024, 191,541 KP individuals across 27 SSA countries received PrEP funded through PEPFAR. The estimated proportion of HIV-negative KP individuals receiving PrEP through PEPFAR ranged from 1.3% (95% credibility interval: 1.0-1.8) among people who inject drugs (PWID) to 5.5% (4.5-6.6) among female sex workers (FSW). Stopping PEPFAR's provision of PrEP could lead to 4,577 (3,398-5,757) additional new HIV infections over 1-year; 2,215 (1,367-2,866) among men who have sex with men (MSM), 1,838 (1,198-2,763) among FSW, 350 (186-617) among transgender women (TGW), and 154 (53-232) among PWID. This corresponds to relative increases in new HIV infections of between 0.7% (0.2-1.1) among PWID to 3.1% (1.9-4.0) among MSM, with country-level increases estimated to exceed 5% in 7 countries for MSM, 2 countries for PWID, and 6 countries for TGW and FSW.
Conclusions: Mitigation measures, including funding through alternative international donors or domestic government budgets, are needed to prevent the detrimental impact of PEPFAR's funding cuts for PrEP, particularly in high coverage countries.

OAS0104LB

Short cycle antiretroviral therapy (ART) with weekends off is inferior to continuous ART in adolescents living with HIV receiving tenofovir disoproxil fumarate/lamivudine/dolutegravir (TLD) in sub-Saharan Africa: BREATHER Plus 96-week results

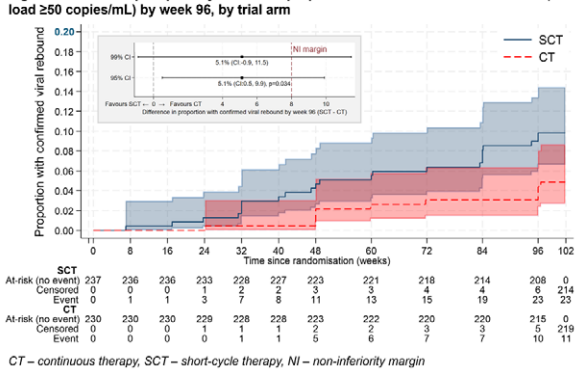
A. Kekitiinwa[1], A. Jennings[2], M. Bwakura Dangarembizi[3], C. Kityo[4], A. Siika[5], M. Archary[6], L. Jafta[7], G. Akabwai[1], M. Chitsamatanga[3], S. Nakabuye[4], C. Kiilu[5], R. Mngqbisa[6], A. Green[2], J. Seeley[8], H. Mugerwa[4], S. Walker[9], N. Apoto[1], D. Burger[10], S. Salomone[2], A. South[2], C. Giaquinto[7], A. Bamford[2], M. Thomason[2], D. Ford[2], S. Pett[2], BREATHER Plus trial team
[1]Baylor College of Medicine, Department of Pediatrics, Kampala, Uganda, [2]Medical Research Council Clinical Trials Unit at University College London (UCL), London, United Kingdom, [3]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [4]Joint Clinical Research Centre, Kampala, Uganda, [5]Moi University Clinical Research Centre, Eldoret, Kenya, [6]University of KwaZulu-Natal, Department of Paediatrics and Children Health, King Edward VIII Hospital, Enhancing Care Foundation, Durban, South Africa, [7]Fondazione Penta ETS, Padova, Italy, [8]Medical Research Council/ Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine Uganda Research Unit, Entebbe, Uganda, [9]University of York, Centre for Health Economics, York, United Kingdom, [10]Radboud University Medical Center Nijmegen, Department of Pharmacy, Nijmegen, Netherlands, the

Background: Short-Cycle Therapy (SCT) with 4/5 sequential days-on ART, 2/3 days-off ART has previously shown non-inferior virological outcomes versus daily ART. Most data are in adults with frequent real-time viral load (VL) testing; dolutegravir-based SCT data are limited.
Methods: BREATHER Plus was a non-inferiority, 96-week trial in Kenya/South Africa/Uganda/Zimbabwe. Adolescents (12-19years), suppressed (VL<50copies/mL) on tenofovir disoproxil fumarate/lamivudine/dolutegravir (TLD), with no prior treatment failure, were randomised to continue daily ART (CT) or switch to SCT (5 days-on, 2 days-off). The primary outcome was the adjusted Kaplan-Meier estimated proportion with confirmed VL ≥50copies/mL by week 96. The non-inferiority margin and significance level depended on the CT event rate (8% margin, 99%CI for 5% event rate). Routine 6-12 monthly VLs were used for participant management; SCT participants with real-time confirmed VL ≥50copies/mL returned to CT. Additional 8-12 weekly VLs were measured retrospectively. A MEMScap sub-study (n=210) in Uganda/Kenya captured ART bottle openings across weeks 8-32 and 48-72. We present 96-week data.
Results: 470 (239 SCT, 231 CT) participants were enrolled [263(56%) female, median age 16.5years (IQR:14.6-18.1), prior ART duration 11.8years (IQR:8.6-14.1)]. At week 96, 98% remained in follow-up. 23(10%) SCT vs. 11(5%) CT participants had confirmed VL ≥50copies/mL, difference SCT-CT 5% (99%CI: -0.9,11.5); an 8% higher rate of virological rebound in SCT was not rejected (Figure).

At the 5% significance level, SCT was inferior to CT (p=0.034). 1 SCT and 2 CT participants changed ART regimen for AEs. Proportions with cross-sectional VL<50copies/mL at week 96 were similar [215(93%) SCT, 211(93%) CT]. 14 SCT and 14 CT participants experienced ≥1 SAE (p=0.938).

In the MEMSCap sub-study, 93% and 92% of expected tablets were taken in SCT and CT respectively, although in both groups only 71% of weeks were fully adherent to strategy.

Figure: BREATHER plus primary outcome - proportion with confirmed viral rebound (viral load ≥50 copies/mL) by week 96, by trial arm



CT – continuous therapy, SCT – short-cycle therapy, NI – non-inferiority margin

Conclusions: TLD-based SCT cannot be recommended for adolescents living with HIV, using 6-12 monthly VL monitoring.

OAS0105LB

Long-acting cabotegravir and rilpivirine in adults with suboptimal HIV control in sub-Saharan Africa: the IMPALA trial 48-week results

[1]MRC/UVRI-LSHTM Uganda Research Unit, Entebbe, Uganda, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Brighton and Sussex Medical School, Global Health and Infection, Brighton, United Kingdom, [4]University of Nairobi, Nairobi, Kenya, [5]CAPRISA, Durban, South Africa, [6]Desmond Tutu Health Foundation, Cape Town, South Africa, [7]Infectious Diseases Institute, Kampala, Uganda, [8]Joint Clinical Research Centre, Fort Portal, Uganda, [9]Jomo Oginga Odinga Teaching and Referral Hospital, Kisumu, Kenya, [10]Joint Clinical Research Centre, Lubowa, Uganda, [11]Johnson and Johnson, Lagos, Nigeria, [12]Johnson and Johnson, Accra, Ghana, [13]Johnson and Johnson, Beerse, Belgium, [14]Johnson and Johnson, Cape Town, South Africa

Background: In sub-Saharan Africa, 1.3 million people taking oral antiretroviral therapy (ART) are not virally suppressed. Long-acting (LA) treatment may benefit those with adherence challenges. We investigated the efficacy and safety of LA cabotegravir (CAB) and rilpivirine (RPV) in a population previously non-adherent to oral ART.

Methods: IMPALA (NCT05546242) is a multicentre, open-label, randomised, non-inferiority trial in Uganda, Kenya and South Africa. Participants had recent HIV-1 viral load (VL) >1000 copies/ml or poor engagement in care. Viral suppression (<200 copies/ml) on dolutegravir-based therapy was required prior to randomisation. Participants were randomised 1:1 to receive 2-monthly CAB+RPV-LA or to continue oral therapy.

The primary endpoint was the proportion with VL <50 copies/ml at 48-weeks in the intention-to-treat-exposed population (by FDA snapshot algorithm, -10% non-inferiority margin).

Secondary endpoints included confirmed virological failure (CVF, two consecutive VLs ≥200 copies/ml, 4% non-inferiority margin; a single VL >1000 copies/ml was a pre-specified sensitivity analysis).

Results: Of 540 participants, 60.0% were female, median age 40 years (IQR 33-48), 99.6% were Black. At 48-weeks, 91.4% (245/268) on CAB+RPV-LA had VL <50 copies/ml versus 89.2% (240/269) on oral ART (risk difference (RD): 2.3%, 95%CI -2.7% to 7.2%), *Figure 1.*

CVF was infrequent (1.9% (5/268) with CAB+RPV-LA versus 0/269 oral arm; RD: 1.9%, 0.3% to 3.5%). For any VL >1000 copies/ml during follow-up, CAB+RPV-LA was superior (7/268 versus 18/269; RD: -4.1%, -7.7% to -0.6%). All 4/4 with CVF who switched to once-daily dolutegravir-based ART re-suppressed. Safety outcomes were comparable. Of those on CAB+RPV-LA, 93.6% (249/266) preferred injectable therapy.

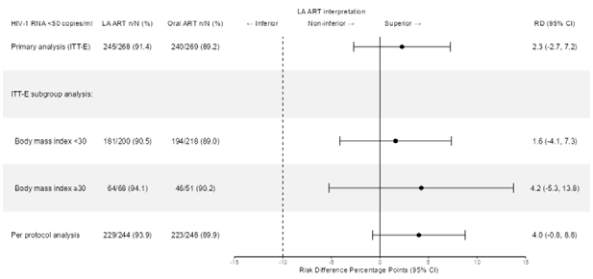

Figure 1.

Conclusions: In people with adherence challenges, CAB+RPV-LA was non-inferior to dolutegravir-based ART for viral suppression and CVF, and performed better when considering any VL >1000 copies/ml, which is relevant for HIV transmission risk. A strong preference for injectable therapy, indicates that CAB+RPV-LA may play a key role for specific populations in the public health approach.

OAS0106LB

Safety and pharmacokinetics of MK-8527 oral once-monthly: a phase 2 study in adults at low risk of HIV-1 exposure

Background: Long-acting options for HIV-1 pre-exposure prophylaxis (PrEP) are needed. MK-8527 is a novel, oral, nucleoside reverse transcriptase translocation inhibitor (NRTTI) with pharmacokinetic properties supporting once monthly (QM) dosing. We studied the safety and pharmacokinetics of MK-8527 oral QM in adults at low risk of HIV-1 exposure.

Methods: In this double-blind, multicenter study (NCT06045507), adults 18–65 years of age were randomized 2:2:2:1 to receive MK-8527 (3, 6, or 12 mg) or placebo QM for 6 months.

Adverse events and laboratory tests were monitored through 8 weeks after the last dose. MK-8527 in plasma was measured for all participants. MK-8527-triphosphate (TP), the active form, in peripheral blood mononuclear cells (PBMCs) was measured in a subset of participants. Pharmacokinetic exposures for MK-8527 and MK-8527-TP were based on non-compartmental analysis of the sparse data collected in the study.

Results: 350 participants were enrolled (58.3% female; median age 28 years; 51.4% White, 41.4% Black/African American, 2.3% Asian) and received at least one dose of study intervention; 328 (93.7%) received all six doses. The incidence of adverse events was similar for MK-8527 and placebo (Table 1). No clinically meaningful changes were seen in laboratory tests, including total lymphocyte and CD4 T-cell counts (Table 1).

N (%) of participants with:	MK-8527 3 mg (N=101)	MK-8527 6 mg (N=101)	MK-8527 12 mg (N=99)	Placebo (N=49)

* AE's causing discontinuation of MK-8527: migraine (n=1) and decreased lymphocyte/CD4 T-cell count (n=1) in 6 mg group; hypoaesthesia (n=1) in 12 mg group.

Table 1. Summary of safety through follow-up week 8.

Pharmacokinetic parameters for MK-8527 and MK-8527-TP were dose proportional (Table 2).

Analyte	Dose	N	$AUC_{0\text{-}tau}$ (h*µmol/L) GM (%GCV)	C_{max} (µmol/L) GM (%GCV)	T_{max} (hr) Median (Range)
MK-8527	3 mg	78	0.129 (81.5)	0.0320 (67.5)	0.55 (0.25 - 4.28)
	6 mg	92	0.404 (37.3)	0.0538 (73.5)	0.56 (0.25 - 4.38)
	12 mg	95	0.836 (55.0)	0.108 (72.5)	0.57 (0.27 - 4.12)
Analyte	Dose	N	$AUC_{0\text{-}tau}$ (h*pmol/10^8 cells), GM (%GCV)	C_{max} (pmol/10^8 cells), GM (%GCV)	T_{max} (hr) Median (Range)
MK-8527-TP	3 mg	20	20.7 (255.5)	0.325 (78.7)	23.44 (3.53 - 27.45)
	6 mg	23	128 (178.6)	0.782 (72.2)	23.55 (3.67 - 47.07)
	12 mg	19	287 (55.9)	1.23 (63.9)	23.10 (3.63 - 26.15)

AUC, area under the concentration time curve; C_{max}, maximum concentration; GCV, geometric coefficient of variation; GM, geometric mean; T_{max}, time to maximum concentration.

Table 2. Summary of pharmacokinetic parameters for MK-8527 in plasma and MK-8527-TP in PBMCs following administration of multiple oral doses of MK-8527.

Conclusions: MK-8527 was well tolerated with a similar safety profile to placebo in adults at low risk of HIV-1 exposure. The pharmacokinetics of MK-8527 and MK-8527-TP support the continued development of MK-8527 oral QM for PrEP.

Late-breaker poster exhibition

LB01

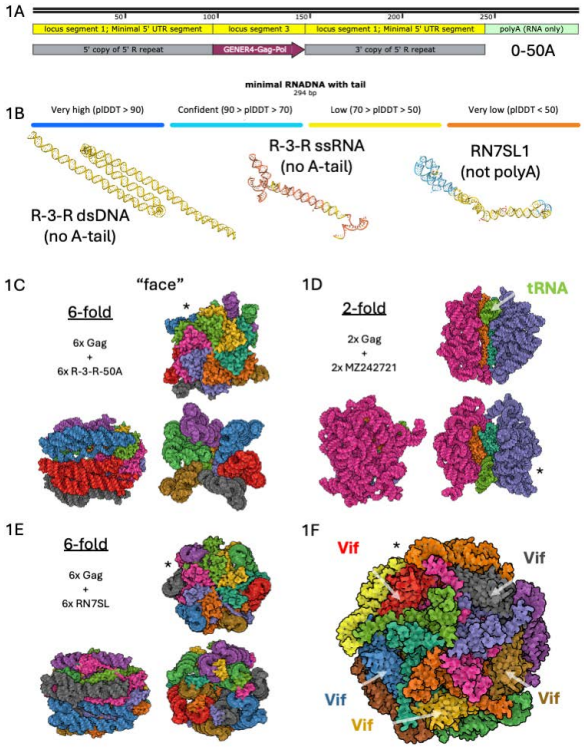
Cargo-bearing Gag+RNA ribonucleoprotein complexes are predicted to form without kissing and independently of host cell membrane seeding

A.R. Gener[1]

[1]Independent, Los Angeles, United States

Background: HIV RNA and protein output remain undercharacterized. Here, I used polyA mapping to update the HIV-1 (NL4-3) mRNA Atlas to version 2.0. This improved Atlas facilitated the design of minimal HIV constructs to investigate higher-order viral structures, such as HIV-1 Gag+RNA ribonucleoprotein (RNP) complex formation.

Methods: I realigned long-read HIV sequencing data to the Atlas reference genome MZ242719 modified with a 300A tail, using optimized Minimap2 parameters (-splice kmer=14). I developed **AtlasWriter** (https://github.com/GenerGener/AtlasWriter) to record polyA mRNAs, and designed a minimal HIV-1 construct (R-3-R-50A; **Figure_1A,1B**) to predict the structures of NL4-3 Gag+RNA complexes using AlphaFold 3/Server constrained by the 5000-token limit.



Results: PolyA mapping revealed alternative transcription start sites and cell type-specific alternative polyA sites. Most HIV polyA tails were between 0-50A. Using minimal RNA constructs, AlphaFold predicted: (**Figure_1C-1F**) Gag RNP complexes ~170-230Å-wide increasingly sequestered N-terminal p17/matrix internally in higher-order complexes with bulkier RNAs (Gag+R-3-R-50A 6-mer shown); (**Figure_1D**) Gag+MZ242721 complexes formed 2-fold symmetric heterotetramers ~200-230Å-wide with HIV mRNA positioned externally, preventing dimerization via "kissing" GCGCGC loop-loop base pairing; Gag multimerization was polyA-independent, though incidental RNA "handshaking" was observed; RNP „pockets" selectively accommodated tRNA (**Figure_1D**), Vif (Gag+RNA+Vif 5-mer shown **Figure_1F**), while excluding APOBEC3G; (**Figure_1E**) Gag+human RN7SL1 complexes closely resembled Gag+R-3-R-50A but with greater N/C-terminal variability. Several retroviruses exhibited similar predicted Gag+RNA multimerization: SIV-Mac239, HTLV-1/2, and Rous Sarcoma Virus.

Conclusions: The updated HIV-1 Atlas predicted novel RNA/protein truncations and enabled the rational design of minimal HIV constructs for structural prediction, providing novel insights into Gag+RNA assembly dynamics. AlphaFold predictions suggest Gag+RNA interactions occur independently of host membrane involvement, possibly before virion assembly/packaging. Gag also formed similar complexes with an abundant host RNA RN7SL1, suggesting at least two Gag RNP pools exist. These predictions extend beyond HIV-1, offering new targets for experimental validation and therapeutics development.

Bypassing the activation of PKC to reverse HIV latency minimizes the transcription-dependent downregulation of the CD4 receptor

U. Mbonye[1], A. Bellomo[2,3], E. Elhalem[2,3], L. Gandolfi Donadio[2,3], M. Julieta Comin[2,3], J. Karn[1]

[1]Case Western Reserve University, Molecular Biology and Microbiology, Cleveland, United States, [2]National Institute of Industrial Technology, Department of Active Ingredients and Biorefineries, Buenos Aires, Argentina, [3]National Scientific and Technical Research Council, Buenos Aires, Argentina

Background: The deliberate reactivation of latent HIV to enable immune recognition and clearance of persisting infected cells requires identifying non-toxic latency-reversing agents (LRAs) that activate P-TEFb, a cellular transcription factor necessary for efficient HIV-1 RNA synthesis. We have recently discovered that natural diacylglycerol (DAG)-mimicking PKC agonists and synthetic DAG mimetics, which bind RasGRP1 potently, can reverse HIV-1 latency by inducing P-TEFb through a PKC-independent RasGRP1-Ras-Raf-MEK-ERK1/2 pathway.

Here, we show that targeting RasGRP1 preferentially over PKC using DAG indololactones is a novel and safe LRA strategy that obviates off-target unwanted effects of T-cell activation and significant downregulation of the CD4 receptor.

Methods: Synthetic DAG indololactones, possessing known differential affinities for PKC and RasGRP1, were evaluated for their ability to stimulate active P-TEFb and modulate the surface expression of CD3, CD4, CD28, CD45-Ro, CD25, and CD69 in memory CD4+ T cells derived from healthy donors. Combinatorial latency reversal studies were conducted in a primary T-cell latency model to assess the effectiveness of DAG indololactones in synergizing with LRAs that stimulate HIV transcription initiation.

LRA combinations deemed effective in the ex vivo model were subsequently tested in memory CD4+ T cells obtained from treated people living with HIV.

Results: DAG indololactones effectively induced active P-TEFb with minimal induction of T-cell activation markers, specifically CD69 and CD25. The DAG indololactone 2A127, which preferentially binds RasGRP1 over PKC by more than 60-fold, synergized with HDAC inhibitors to reactivate latent HIV-1 in primary T cells.

While PKC agonists induced a rapid, selective, and drastic downregulation of CD4 on uninfected memory CD4+ T cells, the combination of 2A127 and an HDAC inhibitor did not alter the expression of any surface receptors examined. Unexpectedly, PKC agonist-induced CD4 loss was effectively reversed by transcription inhibition but not by lysosomal or proteasomal degradation inhibitors.

Conclusions: DAG indololactones enhance P-TEFb expression in memory T cells and can work synergistically with HDAC inhibitors to reverse HIV-1 latency with minimal T-cell activation and disruption of CD4 surface expression.

These findings support the hypothesis that a dual LRA strategy focusing on P-TEFb biogenesis and the epigenetic activation of the HIV-1 promoter can effectively and safely reverse viral latency.

LB03

Microfold (M) cell-related factors reverse HIV latency *in vitro* and *in vivo*

R.L. Creighton[1], M.B. Acharya[2], C.N. Levy[1], S.M. Hughes[1], J.G. Smith[2], E.P. Browne[3], S.A. Lee[4], F. Hladik[1], G.G. Gornalusse[1]

[1]University of Washington, Obstetrics and Gynecology, Seattle, United States, [2]University of Washington, Microbiology, Seattle, United States, [3]University of North Carolina, Medicine, Division of Infectious Diseases, Chapel Hill, United States, [4]University of California, San Francisco, Medicine, Division of HIV, Infectious Diseases & Global Medicine, San Francisco, United States

Background: Transient increases in viremia occur in people living with HIV (PLWH) on antiretroviral treatment (ART). The molecular mechanisms and reservoir sites driving these viral "blips" are not fully understood. The gastrointestinal (GI) tract is the largest HIV reservoir, and its immunophysiology could promote HIV reactivation. We previously found that microfold (M) cells in the intestinal epithelium produce high levels of interferon-stimulated genes (ISGs), with the potential to reactivate HIV.

Here, we used an *in vitro* model and clinical data to test if factors required for M cell differentiation and/or secreted by M cells can reactivate latent HIV.

Methods: Enteroids were cultured from freshly isolated duodenal crypts in an extracellular matrix, and M cells were differentiated by addition of RANKL, retinoic acid, and lymphotoxin $\alpha_2\beta_1$ ($LT\alpha_1\beta_2$).

Expression of M-cell defining genes (*SpiB*, *GP2*, *CCL20*) and ISGs was measured by digital PCR. HIV reactivation was evaluated in J-Lat 11.1 T cell and U1 promonocytic cell lines by measuring GFP expression and polyadenylated HIV-1 mRNA, respectively. We explored correlations of CD4+ T cell lymphotoxin signaling pathway gene expression with cell-associated unspliced HIV-1 RNA (HIV usRNA) in blood samples from 154 virologically suppressed PLWH.

Results:

- Differentiated enteroids had a typical M cell phenotype: increased expression of *GP2* (120-fold), *SpiB* (1,080-fold), *CCL20* (6.3-fold), and *IFI6* (3.1-fold).
- *In vitro*, $LT\alpha_2\beta_1$ reactivated HIV in T cells (7-fold increase in GFP) and in promonocytic cells (10.5-fold increase in polyadenylated HIV-1 mRNA copies).
- Supernatants from flagellin-treated M cell-differentiated enteroids reactivated HIV in the T cell model (1.3-fold over control).
- In an exploratory analysis of blood from PLWH, expression of lymphotoxin A was negatively correlated (r=-0.20, p=0.015) and lymphotoxin B was positively correlated (r=0.23, p=0.008) with HIV usRNA.

Conclusions: We demonstrated that a cytokine required for M cell differentiation ($LT\alpha_2\beta_1$) and factors secreted by differentiated enteroids reactivated HIV *in vitro*.

Furthermore, CD4+ T cell expression of lymphotoxin genes correlated with HIV transcription *in vivo*. These results reveal a role for M cells in shaping the HIV reservoir, with both M cell-differentiating and M cell-secreted factors leading to HIV reactivation.

sc-SQuHIVLa: advancing HIV-1 reservoir quantification through single-cell in situ RT-LAMP amplification and flow cytometric detection

T. Hossain[1], Z. Sinay[1], M. Horwitz[1], B. Kanalmaz[1], S. Rao[2], R.-J. Palstra[1,3], T. Mahmoudi[1,3]

[1]Erasmus MC, Pathology, Rotterdam, Netherlands, the, [2]Erasmus MC, Biochemistry, Rotterdam, Netherlands, the, [3]Erasmus MC, Urology, Rotterdam, Netherlands, the

Background: Despite advances in combination antiretroviral therapy (cART), HIV-1 persists in a latent reservoir within CD4+ T cells, necessitating lifelong therapy and hampering curative strategies. Accurate quantification of the inducible HIV-1 reservoir is critical for evaluating novel interventions but remains challenging due to the extremely low frequency of reservoir cells. We previously developed SQuHIVLa (Specific Quantification of Inducible HIV-1 by LAMP), an RT-LAMP-based assay detecting multiply spliced (ms) HIV-1 RNA, a key biomarker of viral reactivation, followed by limiting dilution and maximum likelihood estimation to quantify reservoir size.

However, this traditional limiting dilution SQuHIVLa approach can yield wide confidence intervals and reduced precision when detecting naturally small or intervention-reduced reservoirs.

To overcome these limitations, we developed sc-SQuHIVLa, a novel single-cell assay enabling direct in situ detection of msRNA-positive cells by flow cytometry, thereby improving sensitivity, scalability, and precision.

Methods: Using the JLat 11.1 HIV-latent cell model, we systematically optimized fixation and permeabilization protocols, comparing paraformaldehyde and metha-

nol-based methods. Probe delivery efficiency was assessed by flow cytometry, while RNA integrity was evaluated using a Bioanalyzer to determine the RNA Integrity Number (RIN), a standard measure where scores above 7 indicate intact RNA.
We further optimized in-situ RT-LAMP conditions, amplification duration, and probe concentration to maximize msRNA-positive cell detection by flow-cytometry. Assay performance was evaluated by quantifying the frequency of msRNA-positive cells and assessing specificity, background signal, and morphology retention.
Results: Methanol provided superior intracellular probe access and morphology preservation. Fixation enabled rapid permeabilization, achieving probe delivery in 100% of cells within 10–15 minutes. Bioanalyzer analysis confirmed excellent RNA preservation, with RIN scores consistently exceeding 7 after fixation and washing steps. Under optimized conditions, sc-SQuHIVLa reliably distinguished msRNA-positive from negative cells with minimal background. Flow cytometry analysis demonstrated clear separation of positive populations, robust amplification, and high single-cell sensitivity, validating the feasibility and reliability of the method.
Conclusions: sc-SQuHIVLa represents a significant advancement over traditional limiting dilution SQuHIVLa by enabling single-cell resolution of inducible HIV-1 msRNA expression. Its enhanced sensitivity, precision, and scalability offer a powerful and resource-efficient tool for monitoring HIV-1 cure strategies, especially in clinical trials and resource-limited settings.

LB05

In-depth longitudinal characterization of the HIV-1 reservoir and immune compartment in PWH diagnosed at non-acute stage

L. de Vries[1], K.S. Hensley[2,3], T. Hossain[1], J. van Osch[4], R. Crespo[1], A.U. Gorska[3,4], J.J. van Kampen[4], T. Mesplède[4], P.D. Katsikis[5], Y.M. Mueller[5], C. Rokx[2,3], S. Rao[6], T. Mahmoudi[1,7,6]
[1]Erasmus MC, Pathology, Rotterdam, Netherlands, the, [2]Erasmus MC, Internal medicine, Rotterdam, Netherlands, the, [3]Erasmus MC, Medical Microbiology and Infectious Diseases, Rotterdam, Netherlands, the, [4]Erasmus MC, Viroscience, Rotterdam, Netherlands, the, [5]Erasmus MC, Immunology, Rotterdam, Netherlands, the, [6]Erasmus MC, Biochemistry, Rotterdam, Netherlands, the, [7]Erasmus MC, Urology, Rotterdam, Netherlands, the

Background: In depth characterization of the dynamics of the HIV-1 reservoir in distinct molecular compartments as well as the immune system in non-acutely diagnosed People with HIV-1 (PWH), who comprise the majority of PWH, is essential for the development of effective cure strategies.
Additionally, PWH who started ART after the acute phase are a heterogeneous group with progressive risk of opportunistic complications when CD4 T-cell counts are under 350 cells/mm^3 (late-stage disease) at diagnosis. With 53% of PWH in the Netherlands diagnosed at a late stage, it is important to stratify this group within studies.
Methods: Here, a cohort of 35 participants diagnosed in a non-acute phase were included and underwent sampling at the start of therapy (week 0), half a year (week 24) and a year (week 52) after starting therapy. The viral reservoir was quantified at week 24 and 52 with methods detecting GagPol RNA (FISH-Flow), multiple spliced RNA (SQuHIVLa), intact/defective DNA (IPDA) as well as p24 protein (Flow-cytometry). Activation-Induced Markers assay was performed detecting HIV reactive T-cells after stimulation with Nef, Gag, Pol, Tat and Env peptides. Additionally, deep immunophenotyping was performed with 45-color spectral flow cytometry at week 0 and week 52 and analysed with several methods including unsupervised clustering.
Results: The cohort consisted of 35 participants, most assigned male sex at birth (85.7%). 16 (46%) participants were diagnosed at a late stage. The most common HIV-1 subtype was B (68%). The median reservoir size measured with SQuHIVLa, p24 flow-cytometry and FISH-Flow was comparable between weeks 24 and 52, as well as between weeks 24 and 52 in late and non-late diagnosis, albeit with large donor-to-donor variability. A decrease in median percentages of CD8+CD69+4-1BB+ T cells/total cells between week 0 and week 52 was observed after stimulation with Gag and Pol peptides. Full spectral deep immunophenotyping at weeks 0 and 52 characterized the immune compartment.
Conclusions: The reservoir at different molecular compartments remained stable between 24 and 52 weeks after start of ART, while a decreasing trend in HIV-specific CD4+ and CD8+ T-cells was observed.

LB07

Effect of the menopausal transition on HIV-1 reservoir outgrowth in a longitudinal cohort in Rakai, Uganda

[1]Western University, Microbiology and Immunology, London, Canada, [2]Western University, Pathology and Laboratory Medicine, London, Canada, [3]Rakai Health Sciences Program, Laboratory, Kyotera, Uganda, [4]National Institute of Allergy and Infectious Diseases, National Institutes of Health, Laboratory of Immunoregulation, Division of Intramural Research, Bethesda, United States, [5]Rakai Health Sciences Program, Data, Kyotera, Uganda, [6]Johns Hopkins University, School of Medicine, Baltimore, United States, [7]Institute of Infectious Disease and Molecular Medicine, University of Cape Town, Cape Town, South Africa, [8]Western University, Department of Epidemiology and Biostatistics, Schulich School of Medicine and Dentistry,, London, Canada

Background: Lifelong antiretroviral therapy is necessary to maintain HIV-1 suppression due to persistence of HIV proviruses integrated into the genomes of host cells. Expression of viral genes can trigger immune responses against these cells, leading to their clearance from the

body. However, the likelihood of reactivation (inducibility) varies significantly between individuals. Females exhibit reduced viral outgrowth upon ex-vivo stimulation despite similar total HIV-1 DNA levels as males, possibly influenced by higher estrogen levels, which can regulate viral latency. Since estrogen levels sharply decline during reproductive ageing, we assessed changes in viral outgrowth after menopause.

Methods: We performed a retrospective analysis nested within a longitudinal cohort of 90 individuals with HIV-1 at the Rakai Health Sciences Program in Uganda. Participants were virally suppressed (<40 copies/ml) for at least one year at enrollment and provided blood samples over a 5-year follow-up (2015- 2020). We determined menopausal status for female participants (n=56) using a collection of self-reported questions. Viral outgrowth from resting CD4 T cells (rCD4) was quantified using the quantitative viral outgrowth assay (QVOA). We analyzed the fold change in viral outgrowth measured in Inf-ectious units per million rCD4 (IUPM) using Bayesian regression model.

Results: At enrollment, median age was 42.5 (IQR: 37.6-47.3) and 10 (17.9%) participants were post-menopausal; 5 additional participants became post-menopausal during follow-up. The median fold increase in viral outgrowth comparing pre- and post-menopause visits was 1.8 (IQR: 1.5 - 2.3 and 95% CI: 0.93-3.68), controlling for ART duration and regimen.

Conclusions: Our findings indicate that menopause is associated with a near doubling of reservoir outgrowth, supporting estrogen's role in maintaining HIV latency. A limitation of this study is the inability of QVOA to differentiate between inducibility vs quantity of intact provirus.

Future studies employing recently adapted methods to quantify intact provirus in non-subtype B HIV-1 are planned to clarify whether reproductive aging affects absolute reservoir size. These results highlight the importance of including females in HIV cure research and underscore estrogen's potential impact on latency reversal strategies.

LB08

Lipoprotein(a) and De Novo coronary artery calcification in aging Thai PLWH: A six-year study

N. Hiranburana[1], S. Ubolyam[1], T. Apornpong[1], S. Kerr[1,2,3], Y. Jarusyingdumrong[1], P. Chattranukulchai[4], M. Tumkosit[5], A. Avihingsanon[1]

[1]HIV Netherlands Australia Thailand Research Collaboration (HIV-NAT), Medical department, Bangkok, Thailand, [2]Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, Biostatistics Excellence Centre, Bangkok, Thailand, [3]The Kirby Institute, University of New South Wales, Sydney, Australia, [4]Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, Division of Cardiovascular Medicine, Bangkok, Thailand, [5]Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, Department of Radiology, Bangkok, Thailand

Background: Elevated lipoprotein(a) [Lp(a)] is a strong genetically determined independent risk factor for atherosclerotic cardiovascular disease (ASCVD). Levels ≥30mg/dL have shown an associaton with an increased risk of cardiovascular events, and this cutoff value has been incorporated into guideline recommendations from several international societies.

However, its role in predicting de novo coronary artery calcification (CAC >0), a marker of subclinical atherosclerosis, in aging people living with HIV (PLWH) on long-term antiretroviral therapy (ART) remains unclear.

Methods: This cohort study enrolled Thai PLWH aged 50–60 years from HIV-NAT in Bangkok, excluding those with prior ASCVD events. Baseline assessments included 10-year ASCVD risk, smoking and alcohol status, metabolic profiles, HIV virologic control, CD4 count, inflammatory markers, and statin use. CAC scans were performed at baseline (2015–2018) and repeated during follow-up (2023–2024).

Participants with a baseline CAC score of 0 were evaluated for progression in repeated CAC scan and tested for Lp(a). Logistic regression was used to assess the association between elevated Lp(a) (>30 mg/dL) and CAC progression, along with other potential determinants.

Results: Among 135 participants with a baseline CAC score of 0, 68 (50%) developed new coronary calcification over a median follow-up of 5.9 years (IQR 5.5-6.8). At baseline, progressors were more likely to be male (65% vs. 33%, p<0.001), current smokers (14.7% vs. 7.5%, p=0.002), alcohol consumers (31% vs. 8%, p=0.001), hypertension (34% vs. 18%, p=0.05), had a higher prevalence of intermediate-to-high 10-year ASCVD risk (44% vs. 20%, p=0.003). Median Lp(a) levels were significantly lower in progressors compared to non-progressors (17.2 mg/dL, IQR 9.1-35.3 vs. 12.2 mg/dL, IQR 5.5-24.3, p=0.03).

In multivariable analysis, BMI ≥25 kg/m² (OR 3.8 95% CI 1.4–10.3 p=0.009), and smoking (OR 2.96, 95% CI 1.04–8.44, p=0.042) were independently associated with CAC progression. Elevated Lp(a) (>30 mg/dL), Inflammatory markers (hsCRP, IL-6), and triglyceride-glucose (TyG) index and were not significantly associated with increased risk.

Conclusions: Half of the participants developed new coronary artery calcification over the follow-up period. Elevated Lp(a) was not an independent risk factor for CAC progression. Prioritizing smoking cessation, weight management, and lipid-lowering strategies is essential for reducing cardiovascular risk in high-risk PLWH populations.

Background: Mortality in infants with advanced HIV disease (AHD) remains unacceptably high, with pneumonia as the leading cause. Autopsy studies identified cytomegalovirus-associated pneumonia and tuberculosis as frequent causes of death. We evaluated whether empirical treatment with valganciclovir and/or tuberculosis therapy improves survival in infants with HIV-associated pneumonia. Hereby, we report the effect of valganciclovir.

Methods: EMPIRICAL (NCT03915366) was an EDCTP-funded, randomized, multicenter, open-label 2x2 factorial trial in infants aged 28 to 365 days with HIV-associated pneumonia, hospitalized in Mozambique, Uganda, Zimbabwe, Zambia, Malawi, and Ivory Coast. Participants were randomized to arms with valganciclovir (16 mg/kg/bid) for 15 days or to arms without valganciclovir. All-cause 15-day mortality was analyzed using multivariable logistic regression (including and excluding deaths within the first 48 hours). Secondary endpoints included days on oxygen therapy and adverse events (AEs).

Results: We analyzed 558 participants enrolled from March 2020 and January 2024: 276 were allocated to arms with valganciclovir and 282 to arms without valganciclovir. The median age was 4.4 months (IQR, 3.2–7.4); 49.1% were female, 25.4% had severe malnutrition, and 60.6% had oxygen saturation <90%.

Overall, 253/558 (45.3%) participants died during the study. A total of 140/558 (25.1%) died within the first 15 days: 64/276 (23.2%) in the arms with valganciclovir and 76/282 (27.0%) in the arms without valganclovir. Sixty-two deaths occurred within the first 48 hours.

There was no interaction between empirical tuberculosis treatment and valganciclovir (-0.53+/-0.7, p=0.450). Participants receiving valganciclovir were 46% less likely to die at 15 days (odds ratio [OR], 0.54; 95% CI, 0.27–1.18), and 64% less likely to die when excluding those who died within the first 48 hours (OR 0.36 (0.15–0.90)). Valganciclovir did not reduce days on oxygen significantly during the first admission (rate ratio, 0.89 (0.61–1.29)). Treatment with valganciclovir did not increase the probability of having any AE (OR 0.90 (0.21-3.89)), or specifically of neutropenia (OR 0.77 (0.44-1.37)).

Conclusions: Empirical valganciclovir is a safe and effective treatment for infants with severe HIV-associated pneumonia. Based on these findings, valganciclovir may be considered for inclusion in the STOP AIDS treatment protocol for infants with AHD.

Bictegravir/emtricitabine/tenofovir alafenamide after virologic failure to cabotegravir/rilpivirine: A case series

P. Giguere[1,2], M. McGuinty[3,4], K. Agtarap[2], C. Touchie[4,3], S. Kravcik[3,5], J.B. Angel[4,3]

[1]University of Ottawa, School of Pharmaceutical Sciences, Ottawa, Canada, [2]The Ottawa Hospital, Department of Pharmacy, Ottawa, Canada, [3]University of Ottawa, Faculty of Medicine, Ottawa, Canada, [4]The Ottawa Hospital, Department of Infectious Diseases, Ottawa, Canada, [5]The Ottawa Hospital, Department of Medicine, Ottawa, Canada

Background: Virologic failure to cabotegravir/rilpivirine with genotypic resistance is rare in clinical trial and cohorts. There remains interest in how best to manage this clinical situation. While various regimens have been used, often including protease inhibitors, this has not been studied systematically.

Methods: This is a single cohort case series of six persons experiencing virologic failure to cabotegravir/rilpivirine with genotypic resistance from January 2022 to March 2025. Methods and early results were published recent-

ly (AIDS 2025,39(6): 777-779). All received bimonthly cabotegravir and transitioned to bictegravir/emtricitabine/tenofovir alafenamide (bictegravir/FTC/TAF). Virologic and immunologic responses are described.

Results: Six individuals experienced confirmed virologic failure with genotypic resistance. Median time to cabotegravir/rilpivirine failure was 389 days (range 178-1317). In the first person, bictegravir/FTC/TAF was initiated before resistance testing was available. Despite mutations associated with integrase inhibitor resistance, this individual achieved virologic suppression.

As a result, subsequent patients with cabotegravir/rilpivirine failure were similarly switched to bictegravir/FTC/TAF. The cohort (aged 24-63 years, four female) had no preexisting rilpivirine or integrase inhibitor resistance-associated mutations (RAMs), though one person had a history of previous treatment failure with an unknown therapy and no documented viral resistance.

Adherence issues leading to injections out of the treatment window were documented in two patients. At failure, all individuals exhibited both integrase and reverse transcriptase RAMs, with mutations in amino acid 148, with or without amino acid 138 in the integrase gene.

Virologic data is available for 5 of the 6 patients. After a median follow-up of 518 days (range: 271–603), all five individuals remained virologically suppressed on bictegravir/FTC/TAF. CD4 count increased by a median of 45 cells/mm³ (range -85 – 417)

Table
Characteristics of six individuals with virologic failure to cabotegravir/rilpivirine and treatment outcome following treatment with bictegravir/emtricitabine/tenofovir alafenamide

Patient	Clade	BMI kg/m2	Treatment before CAB/RPV	Viral load (copies/ml) at CAB/RPV start	Viral load (copies/ml) at CAB/RPV failure	RAM at CAB/RPV failure		Follow-up on BIC/FTC/TAF	
						NNRTI	InSTI	Most recent viral load (copies/ml)	Duration of therapy (days)
1	C	37	RPV/FTC/TAF	<20	3120	101E	148R	<20	562
2	AG	30	DTG/ABC/3TC	<20	91300	138G, 230L	74I, 138E/K, 140A/G, 148K/Q/R, 230R/S	<20	608
3	C	25	BIC/FTC/TAF	<20	9340	181C, 221Y	138K 148R	<20	518
4	A	31	DTG/RPV	32.5	1290	90I 103N	138K, 148K	<20	271
5	D	29	DTG/ABC/3TC	<20	1280	98G, 101E, 181C, 190A	118R	<20	311
6	A/G	63	DTG/ABC/3TC	<40	1100	103N, 188L	138K 140A 148K	NA	NA

BMI: body mass index; CAB: cabotegravir; RPV: rilpivirine; RPV: rilpivirine; FTC: emtricitabine; TAF: tenofovir alafenamide; DTG: dolutegravir; ABC: abacavir; 3TC: lamivudine; BIC: bictegravir; FTC: emtricitabine; RAM: resistant associated mutations; NNRTI: non-nucleoside reverse transcriptase inhibitor; InSTI: integrase strand transfer inhibitor.

Conclusions: Until the management of cabotegravir/rilpivirine failure is systematically studied, clinical judgement will guide therapeutic decision. Bictegravir/FTC/TAF may offer a viable option for achieving virologic suppression in this setting.

LB11

Liraglutide for obesity in HIV (LIROH): a clinical trial evaluating acceptability, impact on cardiometabolic risks & gut immunity of GLP-1 receptor agonists in South Africa

B. Ngundu[1], G. Gasa[1], A. Derache[1], B. Nhlapo[1], S. Khumalo[1], M. Lam[2], S. Mfusi[1], M. Marin[1], K. Bird[1], M. Ali[3], F. Venter[4], M. Siedner[2], L.-G. Bekker[5], N. Chandiwana[5], H. Kloverpris[1], L. Lebina[1], J. Manne-Goehler[6]

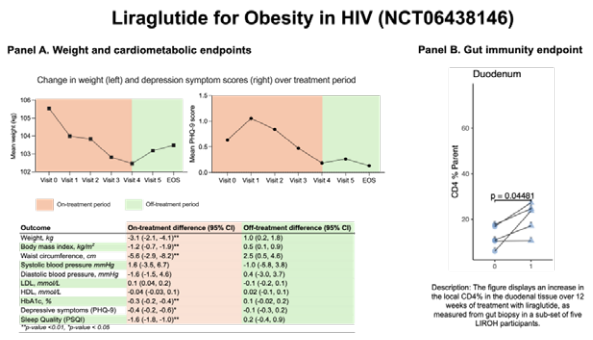
[1]African Health Research Institute, Durban, South Africa, [2]Massachusetts General Hospital, Boston, United States, [3]Emory School of Medicine, Atlanta, United States, [4]Wits Ezintsha, Johannesburg, South Africa, [5]Desmond Tutu Health Foundation, Capetown, South Africa, [6]Brigham and Women's Hospital, Boston, United States

Background: Though obesity is common in people living with HIV (PLWH), GLP-1 receptor agonists (GLP-1RAs) have yet to be trialed in the African region. Here, we evaluated the acceptability, and impact on cardiometabolic risk, depressive symptoms and gut immunity of liraglutide at obesity-dosing for PLWH in South Africa.

Methods: In this open-label, phase IV clinical trial in KwaZulu-Natal, we enrolled 40 PLWH ≥18 years old, suppressed on first-line ART for ≥6 months, with a BMI ≥30 kg/m² and no diabetes. Participants received liraglutide 3.0mg daily plus lifestyle counseling for 12 weeks ("on-treatment") and were followed for 12 more weeks once off-treatment ("wash-out"). Five randomly-selected participants also underwent gut biopsy via endoscopy/colonoscopy at baseline, weeks 12 and 24.

Outcomes included (1) acceptability assessed via enrollment and retention, (2) weight, cardiometabolic risk markers, depressive symptoms, sleep quality at 12 and 24 weeks, and (3) gut immune markers at 12 and 24 weeks.

Results: We screened 51 PLWH from 5/5/24-9/17/24, of whom 43/51 (84%) were eligible, 40/43 (93%) enrolled, and 38/40 (95%) completed treatment. The enrolled group had a mean age of 38, 97% women and mean BMI of 39 [IQR 36, 43].



Liraglutide significantly reduced weight (-3.1kg), waist circumference (-5.6cm), HbA1c (-0.3%), depressive symptoms (-0.4), and improved sleep quality (-1.6) over 12 weeks, though some markers began to worsen again after wash-out (Figure 1).

Gut biopsy revealed significant local CD4 recovery at 12 weeks (p=0.044, additional results forthcoming). Six (15%) participants had adverse effects requiring dose reduction.

Conclusions: Liraglutide was highly acceptable and reduced important cardiometabolic risk markers and depressive symptoms; it also significantly improved local gut immune reconstitution, which may further decrease inflammation-related complications in PLWH. These data demonstrate high potential for unique GLP-1RA benefits in PLWH and support the need for larger trials in PLWH in the African region.

Expanding towards a point-of-care tenofovir-diphosphate enzymatic assay with lateral flow readout for long-term HIV medication adherence detection

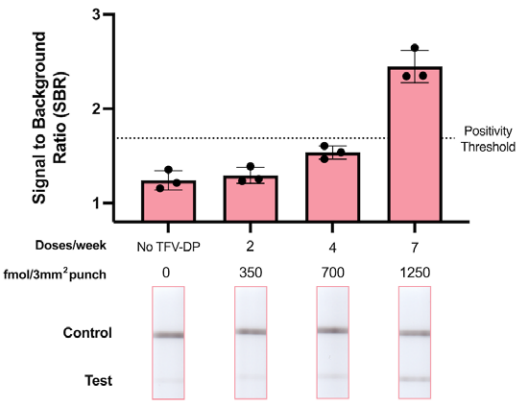
C. Lin[1,2], M. Singh[1], C. Rodgers[1], C. Craig[2], M. Chang[1], A. Olanrewaju[1,2]

[1]University of Washington, Bioengineering, Seattle, United States, [2]University of Washington, Mechanical Engineering, Seattle, United States

Background: Although drug level feedback can improve HIV medication adherence and health outcomes, conventional testing with liquid chromatography tandem mass spectrometry (LC-MS/MS) is arduous and expensive. Urine tenofovir lateral flow assays (LFAs) for measuring adherence are rapid and inexpensive but cannot distinguish between recent (<1 week) and long-term (1-3 month) adherence.

The REverse transcriptase ACTivity (REACT) assay rapidly measures tenofovir diphosphate (TFV-DP) in blood, a biomarker of long-term adherence, based on the drug's inhibition of DNA synthesis by HIV reverse transcriptase (RT) enzyme. REACT results correlate with LC-MS/MS measurements but require instrumentation for fluorescence readout. Here we integrate REACT with CRISPR enzymes and reporters for instrument-free LFA readout.

Methods: We combined CRISPR RNA, Cas12a, DNA template, nucleotides, HIV-RT, biotin-FITC reporters, and spiked TFV-DP concentrations corresponding to 2, 4, and 7 doses/week (350, 700, and 1250 fmol/3mm2 punch) into rehydrated dried blood spots from healthy donors and incubated at 37°C for 60 minutes. Reaction products were visualized on commercially available lateral flow strips were immersed for 10 minutes and scanned to quantify signal-to-background ratio (SBR). We set a positivity threshold 3 standard deviations above the "no TFV-DP" condition mean.



Results: SBR values correlate with TFV-DP levels. LFA signal intensity was significantly different between the "no TFV-DP" condition and 7 doses/week concentrations (p=0.0003). Similarly, we could distinguish between the 2 and 4 doses/week from the 7 doses/week condition (p=0.0002 and 0.0005).

Conclusions: Our enzymatic assay with LFA readout is a step towards point-of-care measurement of long-term HIV medication adherence in resource-constrained settings. Ongoing work will tune the LFA readout to 2 and 4 doses/week and validate these results with clinical samples.

LB13

Understanding causes of death qmong african infants with HIV and pneumonia: A call to address unacceptably high mortality through enhanced in-hospital management and targeted post-discharge care

Gafur[12], B. Nduna[13], R. Varo[2,11], D. Torres-Fernandez[2,11], A. Ballesteros[1], S. Dominguez[1], A. Tagarro[1], C. Moraleda[1], P. Rojo[1,14], Q. Bassat[2,11,15]

[1]Hospital 12 de Octubre Health Research Institute (i+12), Biomedical Foundation of Hospital Universitario 12 de Octubre (FIB-H12O), Innovation in Global Pediatric Infectious Diseases, Madrid, Spain, [2]ISGlobal - Hospital Clínic, Unversitat de Barcelona, Barcelona, Spain, [3]Universidade Eduardo Mondlane, Faculdade de Medicina, Maputo, Mozambique, [4]University of California Los Angeles David Geffen School of Medicine, Los Angeles, United States, [5]Makerere University, Department of Paediatrics and Child Health, School of Medicine, College of Health Sciences,, Kampala, Uganda, [6]Herpez, Lusaka, Zambia, [7]University Teaching Hospitals-Children's Hospital, Lusaka, Zambia, [8]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [9]Malawi-Liverpool-Wellcome Trust Clinical Research Programme, Blantyre, Malawi, [10]Lilongwe Medical Relief Fund Trust, UNC Project Malawi, Lilongwe, Malawi, [11]Centro de Investigação em Saúde de Manhiça (CISM), Maputo, Mozambique, [12]Hospital Central de Nampula, Nampula, Mozambique, [13]Arthur Davidson's Children's Hospital, Ndola, Zambia, [14]Faculty of Medicine, Universidad Complutense de Madrid, Madrid, Spain, [15]ICREA, Pg. Lluís Companys 23, 08010 Barcelona, Spain

Background: Mortality in infants hospitalized with severe HIV-associated pneumonia remains unacceptably high. Beyond the underlying cause, the chain of events leading to the fatal episode remains poorly characterized. We analyzed causes of death (CoD) in the EMPIRICAL trial (NCT03915366), comparing participants who died during the initial hospitalization at trial enrollment with those who died post-discharge during the 12-month study follow-up period.

Methods: EMPIRICAL enrolled infants aged 28-365 days hospitalized with severe HIV-associated pneumonia in Mozambique, Uganda, Zimbabwe, Zambia, Malawi, and

the Ivory Coast. CoD from fatal events occurring from March-2020 to January-2025 were individually determined by two experts integrating antemortem socio-demographic, clinical, and laboratory data prospectively and systematically collected by the study sites, using WHO International Classification of Diseases, 10th Revision (ICD-10) coding. An underlying cause, defined as the condition initiating the chain of events leading to death, was assigned to all deaths.

When more than one condition contributed to death, the chronological chain of events was documented (underlying, comorbid conditions, and immediate causes). A third expert reviewed discrepancies.

Results: Among the 558 participants included, 253 (45.3%) died: 142 (56.1%) died during initial admission at EMPIRICAL enrolment and 111 (43.9%) after initial discharge. Median time to death from enrolment was 3.0 [IQR:2.0;7.0] and 84.0 [IQR:32.5;158.0] days in initial hospitalization and post-discharge deaths, respectively.

A total of 75.7% of children were diagnosed with HIV at the time of enrolment. Baseline median CD4 and HIV viral load were 13.6% [IQR:8.4;20.1] and >10^6copies/mL, respectively. HIV wasting syndrome was the major underlying cause of death (172/253,68.0%), more frequent in post-discharge deaths (54.1% vs. 81.0%, p=0.001).

Pneumonia was the most common immediate cause overall (53.7%), more frequent during admission (64.9% vs. 33.3%, p<0.001), while sepsis was more common postdischarge (12.3% vs. 31.7%, p=0.003). CoD was undetermined in 48/253 (19.0%), mostly among postdischarge deaths outside of a health facility (3.5% vs 38.7%, p<0.001).

Conclusions: In-hospital and post-discharge mortality is high in infants with severe pneumonia and advanced HIV disease. Targeted strategies to prevent and manage underlying conditions, including wasting, optimize treatment of immediate causes of death, including pneumonia and sepsis, and ensure proactive post-discharge follow-up are needed.

LB14

Once-daily dolutegravir–based antiretroviral therapy amongst Ugandan adults with advanced HIV disease receiving 1-month of daily rifapentine and isoniazid for TB preventive therapy: results of a prospective pharmacokinetic cohort study

J. Ellis[1,2], G. Hale[2], A. Buzibye[2], J.F. Ndyetukira[2], A. Sadiq[2], C. Ahimbisibwe[2], S. Nabbaale[2], A. Tukundane[2], W. Bakka[2], A. Kawuma[2], F.V. Cresswell[1,2,3], D.A. Moore[1], D.B. Meya[2,4,5], D.R. Boulware[5], C. Waitt[2,6], J.N. Jarvis[1], M. Nicol[5]

[1]London School of Hygiene and Tropical Medicine (LSHTM), Clinical Research Department, London, United Kingdom, [2]Infectious Diseases Institute, Kampala, Uganda, [3]Brighton and Sussex Medical School, Global Health and Infection, Brighton, United Kingdom, [4]Makerere University, 5. School of Medicine, College of Health Sciences, Kampala, Uganda, [5]University of Minnesota, Minneapolisunite, United States, [6]University of Liverpool, Department of Women's and Children's Health, Faculty of Health and Life Sciences, Liverpool, United Kingdom

Background: 1HP (one month of daily isoniazid and rifapentine) is an efficacious, and well-tolerated TB preventive therapy regimen. 1HP implementation has been slow due to concern about the drug-drug interaction between rifapentine and dolutegravir and limited pharmacokinetic data to inform dolutegravir dosing.

Methods: A single arm, pharmacokinetic study involving 15 adults with advanced HIV disease receiving once daily 50mg dolutegravir-based ART during 1HP therapy, alongside once daily 800mg fluconazole for treatment of cryptococcal meningitis.

Participants underwent intensive pharmacokinetic sampling on day-0, day-5 and day-14 of 1HP therapy; sampling was conducted pre-dose and 2, 4, 8, 24 hours post-dose.

Dolutegravir, rifapentine, and fluconazole plasma concentrations were measured by HPLC mass spectrometry. Dolutegravir and fluconazole pharmacokinetic parameters Cmax, $AUC_{0\text{-}24h}$ and C_{24h} (trough concentration) were described using geometric means and 95% confidence interval (CI).

Parameters on day-5 and day-14 were compared to day-0 using geometric mean ratios (GMR, 90% CI).

Results: Fifteen participants were enrolled, 60% female, median age 37 (IQR 27-41) years, median CD4 count was 11 (IQR 10-25) cells/μL. All 15 participants completed day-0 and day-5 visits, 13 participants completed day-14. Day-14 dolutegravir C_{24h} geometric mean was 0.61 (95%CI 0.32-1.16) mg/L, 9-fold higher than the dolutegravir IC90 of 0.064 mg/L.

Dolutegravir C_{max} and $AUC_{0\text{-}24h}$ did not significantly differ by visit. Day-14 fluconazole C_{max} was reduced by 27% (90%CI 6-43%) compared to baseline, $AUC_{0\text{-}24h}$ was reduced by 33% (7-36%); no cases of cryptococcal meningitis relapse occurred during 18-week follow-up.

Of 14 participants alive at week-12 post 1HP initiation, 11 (78%) had HIV viral load (VL) <200 copies/ml; of 21% (3/14) with an HIV VL ≥200 copies/ml at week-12, two participants had HIV VL <200 copies/ml by week-28 and week-32, and the remaining participant self-discontinued ART.

	PK Visit 1 (Day 0 of 1HP)		PK Visit 2 (Day 5 of 1HP)		Visit 2 vs 1	PK Visit 3 (Day 14 of 1HP)		Visit 3 vs 1
	n	Geometric mean (95% CI)	n	Geometric mean (95% CI)	Geometric mean ratio (90%CI)	n	Geometric mean (95% CI)	Geometric mean ratio (90%CI)
Dolutegravir C_{max} (mg/L)	15	2.93 (1.85-4.65)	15	2.26 (1.08-4.75)	0.85 (0.63-1.15)	14	2.41 (1.70-3.43)	0.81 (0.49-1.34)
Dolutegravir AUC_{0-24h} (mg/L*hr)	15	34.2 (21.1-55.6)	14	25.7 (12.8-51.4)	0.76 (0.57-1.00)	13	31.2 (21.5-45.3)	1.01 (0.61-1.69)
Dolutegravir C_{24} (mg/L)	15	0.94 (0.50-1.74)	14	0.59 (0.31-1.15)	0.64 (0.43-0.95)	13	0.61 (0.32-1.16)	0.76 (0.40-1.46)
Fluconazole C_{max} (mg/L)	15	66.8 (49.8-89.5)	15	63.0 (43.8-90.7)	0.94 (0.42-1.24)	15	48.74 (32.2-73.8)	0.73 (0.57-0.94)
Fluconazole AUC_{0-24h} (mg/L*hr)	15	1072 (749.7-1532.9)	14	993 (661.1-1491.6)	0.89 (0.7-1.12)	13	840.4 (519.2-1360.3)	0.77 (0.64-0.93)
Fluconazole C_{24} (mg/L)	15	32.1 (14.7-70.2	14	24.5 (10.2-59.3)	0.73 (0.30-1.79)	13	34.21 (20.3-57.7)	1.06 (0.63-1.78)

Cmax = Maximum plasma concentration
AUC_{0-24h} = Area Under the Concentration-Time Curve from 0 - 24 hours
C_{24} = Plasma concentration 24 hours post dose (trough concentration)

Table. Dolutegravir and fluconazole pharmacokinetic parameters from non-compartmental analysis.

Conclusions: Despite expected reductions in exposure, once-daily 50mg dolutegravir and 800mg fluconazole dosing may be safe and effective during 1HP.

LB15

Empirical treatment against tuberculosis in infants with HIV-associated pneumonia: a multicenter, open label, randomized factorial clinical trial

Background: Mortality in infants with advanced HIV disease is high. Autopsy studies show that tuberculosis is often missed. Case-fatality rate for severe pneumonia associated with tuberculosis ranges from 4% to 21% in Africa. We evaluated if empirical treatment against tuberculosis (TB-T) and/or cytomegalovirus improve survival in infants with HIV-associated pneumonia. We hypothesized

that even after excluding participants with suspected tuberculosis, empirical TB-T still may be beneficial. Hereby, we report the effect of TB-T.

Methods: EMPIRICAL (NCT03915366) was a EDCTP-funded, randomized, open-label, factorial 2x2 trial in infants aged 28 to 365 days with HIV-associated pneumonia hospitalized in Mozambique, Uganda, Zimbabwe, Zambia, Malawi, and Ivory Coast. Participants were randomized to standard TB-T plus Standard of Care (SoC) or SoC with a enhanced diagnosis strategy at enrolment (Xpert testing of nasopharyngeal aspirate (NPA) and faeces, and testing TB-LAM in urine). Participants in SoC arm received TB-T if tuberculosis was diagnosed post-randomization. All-cause mortality over 1 year of follow-up was analyzed with a multivariable flexible parametric survival model.

Results: We analyzed 558 participants enrolled between March 2020 and January 2024; 276 allocated to TB-T and 282 to SoC + enhanced diagnosis; 134/282(47.5%) participants allocated to arms without empirical TB-T received TB-T post-randomization as part of SoC for suspected or confirmed tuberculosis. The median age was 4.4 months (IQR, 3.2 to 7.4), 49.1% were female, 25.4% had severe undernutrition, and 60.6% had SatO2 <90%. At baseline, 9/479 (1.9%) had Xpert-positive in NPA, 17/520(3.3%) in faeces, 127/493(25.8%) TB-LAM positive, and 1/65(1.5%) positive gastric fluid culture. Globally, 253/558 (45.3%) participants died during the study: 121/282 (42.9%) died in arms without TB-T and 132/276 (47.8%) in arms with TB-T.

There was no interaction between empirical TB-T and valganciclovir (-0.53+/-0.7, p=0.450). We found no significant effect of empirical treatment on the probability of death, (HR 1.07 (95% CI, 0.68-1.69)), in reduction of days of hospitalization over one year (rate ratio 1.03 (0.80-1.33)), in the probability of having any AE (OR 0.86 (0.17-4.01), or specifically of hypertransaminemia (OR 0.73 (0.42-1.27).

Conclusions: After exclusion of possible tuberculosis, empirical TB-T does not improve clinical outcomes in infants with HIV-associated pneumonia, compared to an enhanced diagnosis strategy.

LB16

Is exclusion of tenofovir from antiretroviral regimens safe in Africa: insights on hepatitis B from the switch to DTG/3TC (Sungura) study

L.A. Ombajo[1,2], J. Penner[3], J. Nkuranga[1,2], V. Omodi[1,2], E. Otieno[1,2], M. Kisare[4], S. Wahome[5], F. Ndinya[6], C. Wafula[6]
[1]University of Nairobi, Clinical Medicine and Therapeutics, Nairobi, Kenya, [2]University of Nairobi, Center for Epidemiological Modelling and Analysis, Nairobi, Kenya, [3]University of British Columbia, Family Practice, Vancouver, Canada, [4]ViiV HealthCare, London, United Kingdom, [5]Kenyatta National Hospital, Comprehensive Care Centre, Nairobi, Kenya, [6]Jaramogi Oginga Odinga Teaching and Referral Hospital, Kisumu, Kenya

Background: Tenofovir, the WHO recommended nucleoside reverse transcriptase inhibitor in antiretroviral therapy, is useful for treatment of both HIV and HBV. However, as comorbidities such as kidney and bone disease rise, particularly in older populations, dual drug therapies that exclude tenofovir are increasingly attractive. It is unclear how best to deploy these regimens in contexts with high HBV prevalence and low uptake of HBV vaccination. Reactivation of HBV remains a potential risk in those with previous exposure in whom tenofovir is withdrawn.

Methods: The Sungura study (NCT06444620) is a phase 3 single arm clinical trial at multiple sites in Kenya enrolling participants aged ≥60 years, with VL <50 copies/ml on bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF). Participants with HBsAg + or with evidence of prior infection and no immunity (HBcAb + and HBsAB <10 IU) were excluded. All participants were switched to DTG/3TC at enrollment. Liver chemistries were done at baseline and at week 24. We evaluate the incidence of elevation of liver transaminases at 24 weeks post withdrawal of TAF. The study is continuing to week 96.

Results: Between July and September 2024, 227 participants on B/F/TAF were screened for enrolment into Sungura. Of these, 121 (53.3%) had evidence of prior HBV infection with a positive HBcAb and 29 (12.8%) were excluded due lack of evidence of immunity (1 HBsAg positive, 18 HBsAb <5 and 10 HBsAb 5-<10 IU). 92 participants with HBsAb ≥10 IU were included along with 106 participants with no evidence of previous HBV infection. The median age was 66 years (range 62-81) and 49.2% were female. At week 24, no ALT or AST elevations were observed and there were no incident HBV infections. Additionally, high rates of HIV-1 suppression were observed.

Conclusions: Prior hepatitis B exposure is common in older PWH, majority of whom have immunity and can be safely transitioned to a two-drug regimen that excludes tenofovir. However, HBV serology panels to identify people at risk of HBV reactivation are not routinely available across much of sub-Saharan Africa, and further work is needed to evaluate the necessity of such screening in view of our study findings.

LB17

Efficacy and safety of switching to dolutegravir/lamivudine dual therapy from bictegravir/emtricitabine/tenofovir alafenamide among virally suppressed older adults ≥60 years: week 24 results from the Sungura study

L.A. Ombajo[1,2], J. Penner[3,2], J. Nkuranga[1,2], V. Omodi[1,2,2], E. Otieno[1,2], M. Kisare[4], S. Wahome[5], F. Ndinya[6], C. Wafula[6]
[1]University of Nairobi, Clinical Medicine and Therapeutics, Nairobi, Kenya, [2]University of Nairobi, Center for Epidemiological Modelling and Analysis, Nairobi, Kenya, [3]University of British Columbia, Family Practice, Vancouver, Canada, [4]ViiV HealthCare, London, United Kingdom, [5]Kenyatta National Hospital, Comprehensive Care Centre, Nairobi, Kenya, [6]Jaramogi Oginga Odinga Teaching and Referral Hospital, Kisumu, Kenya

Background: Dolutegravir/lamivudine (DTG/3TC) has demonstrated similar efficacy to three-drug regimens among people without prior virological failure. DTG/3TC minimizes exposure to NRTIs which is particularly relevant for older adults, due to age-related comorbidities and increased likelihood of polypharmacy and drug-drug inter-

actions. DTG/3TC may also potentially cost less than three drug regimens. We evaluated the efficacy and safety of switching older adults from bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF) to DTG/3TC.

Methods: The Sungura Study (NCT06444620) is an open-label, single arm, 96-week study conducted at two sites in Kenya. Eligible participants were adults ≥60 years with HIV-1 viral load <50 copies/mL on B/F/TAF with no prior virological failure and hepatitis B negative; all were switched to DTG/3TC at enrollment. The primary endpoint is the proportion of participants with viral load ≥50 copies/mL at 48 weeks using the FDA snapshot algorithm. We present week 24 results.

Results: Between Jul and Sep 2024, 197 participants enrolled in Sungura, all of whom were black African, 49% female and median age 66 years (range 62 to 81). Baseline prevalence of comorbidities was high (Table). At week 24, all participants remained on DTG/3TC and none (0/197) had HIV viral load ≥50 copies/mL. Incident comorbidities (excluding participants with the comorbidity at baseline) included hypertension in 20% (12/59), impaired fasting glucose or diabetes in 1.8% (3/165), dyslipidemia in 17% (26/151) and grade 3 or 4 creatinine clearance events in 10.3% (14/136). The median change in weight was +0.5kg (IQR -0.2 to 0.5) with 31 (15.8%) participants having ≥5% weight gain. The median change in 10-year ASCVD risk score was +0.6% (IQR -1.9 to 4.1).

Characteristic	Total (n=197)
Time on ART (years)	12.0 (9.5,12.5)
Hypertension*	138 (70%)
Impaired fasting glucose or diabetes mellitus	32 (16%)
Dyslipidemia**	46 (23%)
Grade 3 creatinine clearance abnormality***	61 (31%)
Body-mass index category (kg/m^2)	
Underweight (< 18.5)	5(2%)
Normal (18.5-24.9)	79(40%)
Overweight (25.0-29.9)	67(34%)
Obese (≥ 30)	46(23%)
ASCVD 10-year predicted risk score category	
Low risk (< 5.0%)	1(0.5%)
Borderline risk (5.0-7.4%)	20(11%)
Intermediate risk (7.5-19.9%)	127(65%)
High risk (≥20%)	45 (24%)

Data are median (interquartile range) or n (%) unless otherwise stated. Abbreviations: ASCVD, atherosclerotic cardiovascular disease using the American College of Cardiology risk estimator.
*Hypertension was defined a two elevated readings during screening/enrollment and at least one folow-up high reading, or, on treatment for hypertension, or, documented history of hypertension
**Dyslipidaemia was defined as any one or more of elevated total cholesterol, elevated low density lipoprotein or elevated triglycerides
***Creatinine clearance was calculated using the Cockcroft-Gault equation

Table: Baseline characteristics of virally suppressed adults ≥60 years old who switched to dolutegravir/lamivudine from bictegravir/emtricitabine/tenofovir alafenamide.

Conclusions: At week 24, there were no incidences of virological failure and no withdrawals from the Sungura study. Comorbidities were common, highlighting additional considerations for selecting antiretroviral agents for older populations.

LB18

Prevalence of frailty and neurocognitive impairment, and effects on quality of life among adolescents with perinatal HIV at Kenyatta national hospital

E.W. Kamau[1,2], J. Kinuthia[1,3], D. Wamalwa[2], C. Farquhar[3], C. Mugo[1,3], S. Benki[1], N. Ngumbau[1], M. Marwa[1,3], E. Mukenyi[1], C. Maina[1]

[1]Kenyatta National Hospital, Medical Research Department, Nairobi, Kenya, [2]University of Nairobi, Nairobi, Kenya, [3]University of Washington, Seattle, WA, United States

Background: Adolescents with perinatal HIV are at risk of lower quality of life brought about by non-AIDS associated morbidity due to pre-mature aging. Little is known about frailty in adolescents with perinatal HIV and the effects of frailty and neurocognitive impairment on quality of life.

This study sought to determine the prevalence of frailty and neurocognitive impairments, and the effects of quality of life among adolescents with perinatal HIV.

Methods: A cross-section survey of one hundred adolescents with perinatal HIV(APHIV) screened for frailty and neurocognitive impairment (NCI) using the modified Fried index scale, (Fried LP, 2001) childhood and teenage executive functioning inventory (Thorell L B, 2014) (Alimohamadi, 2022), youth HIV dementia scale (Phillips NJ, 2019) Montreal Cognitive Assessment (Nasreddine ZS, 2005) (MoCA) in a National Referral Hospital in Kenya. Prevalences of frailty and NCI were estimated.

Chi square and Fisher's exact test were used to associate frailty and other independent variables and logistic regression was used to calculate odds ratios. Significance was set at 5% level.

Results: Of APHIV surveyed, 60% were male, 88% were virally suppressed (viral load <200 copies/ml), 60% were older than 15 years and 98% were on DTG-based regimens. All adolescents were either moderately frail (52%) or severely frail (48%). The prevalence of NCI was 19% using the Montreal Cognitive Assessment (MoCA) and 37% using the Youth HIV Dementia scale.

Anxiety was reported in 12.5% of those with severe frailty while none in the group with moderate frailty group had anxiety (p=0.009).NCI was found in 29.8% of those with severe frailty compared to 9.6% in moderate frailty group [OR 4.0 (95% CI 1.3-12.2), p=0.011].

APHIV with severe frailty had a higher proportion with low health-related quality (45.8% versus 28.8% in the moderately frail group). NCI was correlated with elevated blood pressure; 44% with stage 1 hypertension in those without NCI and 55.6% in those with NCI [OR 3.41 (95% CI 0.80-14.44), p=0.036.

Conclusions: High prevalence of frailty indicates the need for longitudinal studies to validate the study findings and inform the need for routine screening for frailty in APHIV.

LB19

Model-based efficacy of long-acting cabotegravir by time since last injection among cisgender men and transgender women enrolled in HPTN 083

M. Moore[1,2], S. Stansfield[1,2], D.J. Donnell[1], B. Hanscom[1], R.J. Landovitz[3], M.-C. Boily[4,2], B. Grinsztejn[5], M. McCauley[6], M.A. Marzinke[7], A. Rinehart[8], J. Rooney[9], D. Dimitrov[1,2,10]

[1]Fred Hutch Cancer Center, Vaccine and Infectious Disease, Seattle, United States, [2]Imperial College, HPTN Modelling Center, London, United Kingdom, [3]University of California Los Angeles, School of Medicine, Los Angeles, United States, [4]Imperial College, School of Public Health, London, United Kingdom, [5]Fundacao Oswaldo Cruz, Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil, [6]FHI 360, Durham, United States, [7]Johns Hopkins School of Medicine, Departments of Pathology and Medicine, Baltimore, United States, [8]ViiV Healthcare, London, United Kingdom, [9]Gilead Sciences, Foster City, United States, [10]University of Washington, Department of Applied Mathematics, Seattle, United States

Background: HIV Prevention Trials Network (HPTN) 083 study demonstrated superiority of bi-monthly long-acting injectable cabotegravir (CAB-LA) to daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC). CAB-LA reduced HIV incidence by ~66% compared to TDF/FTC, a statistically significant result.

However, the pharmacologic correlates of protection have only recently been estimated, and to-date, protective efficacy by time since injection has not been modeled.

Methods: We calibrated curves describing population-level reduction in HIV acquisition vs elapsed time since last injection using data from HPTN 083 through the first year of unblinded follow-up.

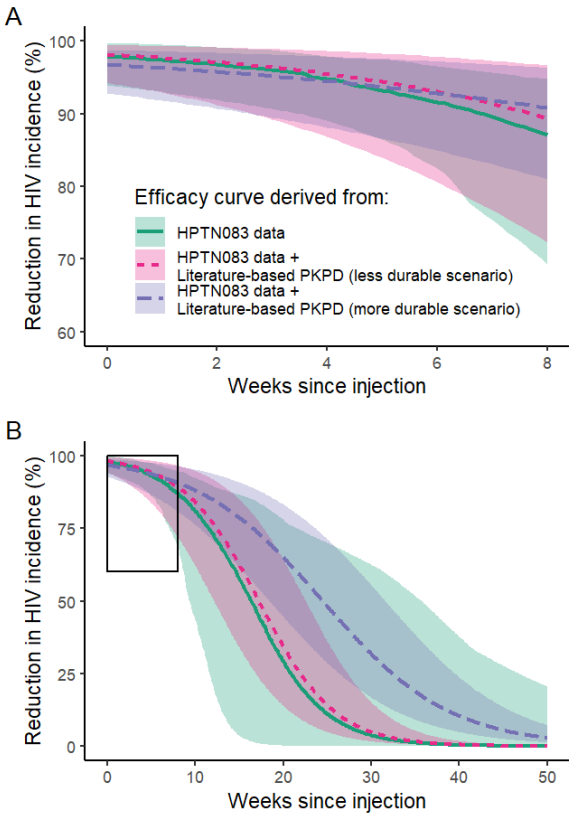
We estimated background HIV incidence using TDF/FTC usage in the randomized placebo control arm and accounted for delays between HIV acquisition and detection using a fully-Bayesian Markov Chain Monte Carlo (MCMC) framework.

Our main curve was calibrated solely using HPTN 083 data. We also created literature-informed curves taking advantage of clinically-derived estimates of the pharmacokinetics: fixing the cabotegravir half-life at six weeks, and in-vitro predictions of pharmacodynamics: assuming a hill equation of order 2 (less durable) or order 6/5 (more durable). By deviance information criterion, all curves were equally plausible given the data.

Results: Using data from HPTN 083 alone, we estimated CAB-LA reduces HIV incidence by 93.9% (95% credible interval 87.9–97.7) within 8 weeks of injection.

Estimated efficacy remained above 70% (95% credible interval 7.9–25.0) for 12.7 weeks and above 50% (95% credible interval 9.3 – 35.8) for 16.4 weeks following injection.

Our literature-informed curves showed similar efficacy within 8 weeks of an injection (Figure A), diverging thereafter (Figure B).



Conclusions: We estimated high preventive CAB-LA efficacy of 93.9%, within eight weeks of an injection. This is consistent with protective efficacy associated with cabotegravir concentrations above 4xPAIC-90 and non-human primate models. Additional clinical data are needed to better inform efficacy after 8 weeks as well as the impact of prior doses.

LB20

Determinants of HIV Pre-Exposure Prophylaxis (PrEP) uptake among youth aged 15-24 years in turbo Sub-County, Uasin Gishu, Kenya

E. Nailantei[1]

[1]Moi University, Nairobi Campus, Kenya

Background: This research aimed to identify determinants of HIV Pre-Exposure Prophylaxis (PrEP) uptake among youth aged 15-24 years in Turbo Sub-County, Kenya, addressing rising HIV infections among Kenyan youth despite PrEP's proven effectiveness in reducing transmission by 48.9% when combined with other strategies.

Methods: This cross-sectional mixed-methods study was conducted in November-December 2024 in Turbo Sub-County, Kenya. The research included 361 youth participants aged 15-24 years, with the sample size determined using Fisher's formula (95% confidence level, 5% margin of error). Data were collected through structured questionnaires, 5 key informant interviews, and 6 focus group discussions. Analysis included bivariate and multivariate logistic regression for quantitative data and thematic analysis for qualitative data.

Results: Overall PrEP uptake was 8.83%, with age-related disparities: 3.37% (under 16), 7.41% (16-18), 9.18% (19-21), and 15.66% (22+ years) (OR=5.32, p=0.011). Uptake was sim-

ilar between females (8.42%) and males (8.81%). Approximately 70% of youth had no awareness of PrEP. Socioeconomic factors showed employed individuals (16.33%) had higher usage than students (6.93%), with usage increasing from 2.25% in the lowest income group to 12.63% in the highest. Those with good PrEP knowledge showed significantly higher usage (22.06% vs. 3.77%, OR=7.21, p<0.001).
Key system challenges included PrEP availability in only 20% of facilities and minimal healthcare worker training. Multivariate analysis identified four independent predictors: well-integrated PrEP services (AOR=3.78), willingness to recommend PrEP (AOR=3.70), history of residential changes (AOR=5.04-7.78), and personally knowing someone with HIV/AIDS (AOR=2.67).
Conclusions: Findings highlight the need for age-tailored prevention approaches and addressing fundamental knowledge gaps through youth-friendly channels. System-level reforms are needed to expand access points and improve provider capacity.
The correlation between knowing someone with HIV and PrEP use suggests the potential effectiveness of peer-based advocacy programs. Cultural and religious barriers require engaging leaders and parents as partners in prevention efforts.
Decentralized delivery models could improve uptake by addressing transportation challenges. Community-level interventions to reduce HIV-related stigma must accompany biomedical prevention efforts. Effective implementation requires creating comprehensive ecosystems of support addressing the complex contexts in which youth make prevention decisions.

LB21

Co-administration of liposomal adjuvant ALF43 along with HIV-1 DNA vaccination improves binding antibody responses against HIV-1

J. Kosgei[1,2], E. Serti Chrisos[3,4], S. Townsley[3,4], Y. Petrova[3,4], P. Nguyen[3,4], L. Metzger[3,4], D. Langat[1,2], I. Daud[1,2], F. Sawe[1,2], B. Slike[3,4], C. Nwoga[3,4], M. Matyas[4], RV460 Study Group
[1]HJF Medical Research International, Kericho, Kenya, [2]Walter Reed Army Institute of Research-Africa, Kericho, Kenya, [3]Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, [4]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [5]University of Massachusetts, Medical School, Worcester, United States, [6]Kenya Medical Research Institute, Kericho, Kenya, [7]National Institute of Allergy and Infectious Diseases, Division of AIDS, Bethesda, United States

Background: Adjuvants improve protein vaccine immune responses. However, their effects on DNA immunizations have not been studied thoroughly in humans. In this double-blind phase 1 HIV vaccine study, we evaluated two novel adjuvants: Army Liposome Formulation containing monophosphoryl lipid A and Cholesterol (ALF43), and Recombinant Double-Mutant *Escherichia coli* Heat Labile Toxin (dmLT) to determine impact on DNA priming.
Methods: 137 healthy participants (including 11 replacements), 18-40 years old, were randomly enrolled into seven groups as depicted in Figure 1.
Participants were primed with plasmid DNA (encoding HIV Env-C gp120) at weeks 0, 4, 12, either given intramuscularly (IM) alone (groups 1+2), combined with dmLT by skin patch (groups 3+4), combined with ALF43 IM (groups 5+6), or combined with HIV Env gp145 C.6980 protein+ALF43 IM (group 7).
All were boosted at weeks 20, 36, 52 with either gp145+Rehydragel (groups 1, 3, 5), gp145+ALF43/Rehydragel (groups 2, 4, 6), or DNA+gp145+ALF43/Rehydragel (group 7).
Binding antibodies (bAb) against consensus or vaccine cognate antigens were assessed using Luminex and ELISA. Neutralization was assessed using the TZMbl assay with tier 1 pseudoviruses from subtypes C, B and CRF01_AE. Peripheral blood mononuclear cell (PBMC) responses were assessed by intracellular cytokine staining against gp145 and gp120 peptide pools and antibody-dependent cellular cytotoxicity (ADCC) was measured against gp145-coated CEM.NKR.CCR5 target cells.
Results: The vaccine was well-tolerated with no difference in adverse events (AEs) between groups and no serious AEs. Two weeks following prime, groups 5+6 generated significantly higher magnitude, cross-clade bAb responses against consensus and gp145 cognate antigens compared to groups 1-4.
No difference was observed in antibody response magnitude between groups post-boost and persisted for 1 year. Group 7 exhibited the highest bAb levels post-prime, and these levels were preserved with boosting.
All groups yielded similar modest tier 1 neutralization. ADCC was higher in group 7 post-prime and increased with boosting in all groups. CD4 T cell responses increased with prime and boost vaccinations, with no difference in magnitude across groups.
Conclusions: ALF43 adjuvant improves DNA priming of this HIV Env vaccine; however, all vaccine/adjuvant combinations attained similar peak antibody titers post-boost. ALF43 in the DNA prime contributed to higher bAb durability.

LB22

Circumcision for HIV prevention in men who have sex with men: an updated meta-analysis and meta-regression

D. Philpott[1], O. de Leon[1], S. Bullock[2], L. Calzavara[2], L. McDaid[3], J. Riddell[4], J. Schneider[5], M. Peck[1], C. Toledo[1], S. Davis[1]

[1]US Centers for Disease Control and Prevention, Atlanta, United States, [2]University of Toronto, Toronto, Canada, [3]University of Queensland, Queensland, Australia, [4]University of Glasgow, Glasgow, United Kingdom, [5]University of Chicago, Chicago, United States

Background: While circumcision reduces HIV risk for men who have sex with women, its value for men who have sex with men (MSM) remains unclear. Any protection would be for primarily-insertive (PI) MSM; potential impact is high given high incidence. Prior meta-analyses were ambiguous due to inconsistent, highly-confounded data.

We performed an updated meta-analysis with additional data, and mitigated confounding and potentially publication bias by fitting a meta-regression model with interaction between sexual role and circumcision status.

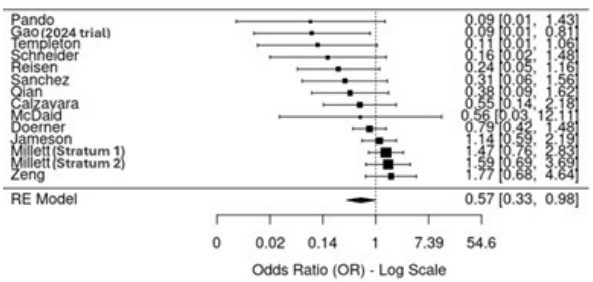
Methods: The observational literature search strategy and findings are described in the companion abstract (02533), which identified 12 studies from five continents with quantitative findings on associations of HIV with circumcision among PI-MSM (as defined by each study). We sought unpublished cell count data from authors on HIV status by circumcision status and sexual role where needed. A 2024 trial was also included. We performed a random-effects (RE) meta-analysis for the main association, using adjusted effect measures when available, and cell counts otherwise.

Among studies reporting stratified results for PI-MSM and other MSM separately, we performed a meta-regression with an interaction term for sexual role. For that analysis, our own primary findings in another companion abstract (03664) were eligible and included also.

Results: Thirteen studies were included in the meta-analysis (see 02533 e-poster); 10 provided data needed for meta-regression. In the meta-analysis (Figure), circumcision was associated with a lower risk for HIV among PI-MSM (odds ratio (OR) = 0.57, 95% CI: 0.33-0.98).

Funnel plots suggested publication bias. In the meta-regression, the interaction term — a ratio of odds ratios — (0.60, 95% CI: 0.42–0.85) indicated a stronger protective association for circumcision among PI-MSM compared to other MSM.

Figure: Forest Plot of the Meta-Analysis of Circumcision for HIV Prevention Among Primarily-Insertive Men who Have Sex with Men



Conclusions: Among PI-MSM, circumcision was protective against HIV. Residual publication bias and confounding are possible. However, findings may reassure PI-MSM considering medical circumcision for HIV prevention.

LB23

Twelve-month retention in a national cohort of PrEP initiators in Rwanda

J. Ross[1], B. Muhoza[2], Q. Shi[3], V. Patel[1], G. Kubwimana[2], P. Harolimana[2], E. Remera[4], K. Anastos[1], G. Rwibasira[4], G. Murenzi[2]

[1]Albert Einstein College of Medicine, Medicine, Bronx, United States, [2]Research for Development (RD Rwanda), Kigali, Rwanda, [3]New York Medical College, School of Health Sciences and Practice, Valhalla, United States, [4]Rwanda Biomedical Center, Kigali, Rwanda

Background: Sub-Saharan Africa (SSA) leads the world in PrEP initiations, yet few data from this region describe longer-term PrEP engagement. Understanding retention among PrEP initiators is critical to the success of HIV prevention efforts in SSA. We describe 12-month retention in a national sample of Rwandan PrEP initiators.

Methods: PrEP implementation in Rwanda began in 2019, initially focused on serodifferent couples, female sex workers (FSW) and gay, bi and other men who have sex with men (GBMSM), then expanding to adolescent girls and young women (AGYW) and others. From June 2023-July 2024, we extracted available data on PrEP initiators from primary health centers in the capital of Kigali and Rwanda's four other provinces into a secure electronic database. Among individuals initiating PrEP with ≥12 months between initiation date and database close, we used multivariable logistic regression to assess individual and health center predictors of 12-month PrEP retention.

Results: Data were available for 15,145 PrEP initiators from 105 health centers: 35 in Kigali, 24 in Eastern province, 20 in Western province, and 13 each in Northern and Southern provinces. Program size ranged from 1 to 904 clients. Among all PrEP initiators, 64% were FSW, 16% were AGYW and 11% were GBMSM. Median age was 26 years and 13% reported an STI in the prior six months. Among 8,426 individuals with ≥12 months of potential follow-up time, overall 12-month retention was 54%. Retention was lower among individuals <24 years (vs ≥24: adjusted odds ratio [aOR] 0.82, 95% CI 0.74-0.91) and FSW and AGYW (vs GBMSM: aOR 0.63 [95% CI 0.54-0.73] and aOR 0.75 [95% CI 0.61-0.92], respectively). Retention was higher among those reporting a recent STI (vs. no STI: aOR 1.25, 95% CI 1.08-1.44) and in health centers with smaller PrEP programs (vs. larger: aOR 1.54 [95% CI 0.99-2.37).

Conclusions: In a large sample of PrEP initiators from over 100 geographically diverse health centers in Rwanda, only about half were retained in care 12-months after enrollment. Retention was lower among FSW and AGYW, who constituted the majority of PrEP initiators. Efforts to strengthen retention and support PrEP engagement, particularly during this critical time, are needed.

LB24

Tracking injectable PrEP use and persistence amongst South African adolescents and young people in an era of PrEP choice

C. Pike[1], K. Lebelo[1], F. Little[2], E. Rousseau[1], P. Macdonald[1], P. Mapukata[1], L. Sekalo[1], O. Vanto[1], L.-G. Bekker[1]
[1]Desmond Tutu Health Foundation, Woodstock, South Africa, [2]University of Cape Town, Department of Statistical Sciences, Cape Town, South Africa

Background: Injectable pre-exposure prophylaxis (PrEP) products promise improved PrEP uptake and persistence. PrEPared to Choose (PtC), a phase 3B clinical trial, tracked uptake and persistence of three PrEP products (oral vs injectable Cabotegravir vs vaginal ring) amongst 1164 South African adolescents and young people (age ≥15 years).

Methods: PtC offered PrEP through a nurse-driven, integrated sexual and reproductive health (SRH) service from two community-based sites (mobile clinic; government clinic) in Cape Town, South Africa. Participants recruited (first come, first served) between February – August 2024 were offered PrEP choice, with unlimited allowance for both product switches and return after periods of discontinuation. Persistence, defined as return for product ≤7 days of a scheduled visit with assumed perfect adherence between visits, was tracked over 7 months.

Persistence amongst injectable PrEP initiators was compared to short-acting PrEP (oral and ring) initiators using a semi-Markov multi-state model that calculated total time spent on PrEP and hazard ratios associated with transitions between injectable PrEP use vs short-acting PrEP use vs time off PrEP.

Results: Participants, predominantly young women (67%,779/1164), PrEP naive (59%,691/1164), and mobile clients (70%, 818/1164), were 2.8 times more likely to initiate on injectable PrEP (74% (862/1164) vs 25% (290/1164) oral vs 1% (12/1164) ring. Injectable users were less likely to discontinue (HR 0.61) or product switch (HR 0.48) compared to short-acting users who were highly likely to both discontinue (HR 9.18) and product switch (HR 12.27).

These outcomes remain unchanged when accounting for participant age, sex, or location of PrEP access. Median time in a PrEP using state was 208 days for injectable initiators vs 28 days amongst short-acting initiators. By month 7, no PrEP users met criteria for "perfect" persistence (i.e. always returned on time, never product switched, no periods of discontinuation).

Conclusions: Real-world, non-reimbursed PrEP use is characterised by dynamic periods of PrEP discontinuation, re-initiation, and product switching. In this context, injectable PrEP uptake, continuation on the same modality, and continuation on PrEP overall is greater than that for short-acting PrEP products over the short-term.

Analyses of persistence that account for diverse PrEP use behaviours better represent real-world PrEP use.

LB25

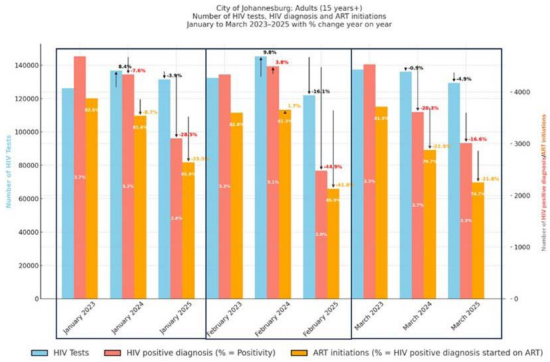
Termination of the USAID APACE award in Johannesburg, South Africa: impact on the number of people living with HIV tested, diagnosed and initiated on anti-retroviral therapy (ART) (January-March 2023-2025)

K. Chauke[1], K. Rees[2,3], P. Dulaze[2], L. Wilkinson[4]
[1]Gauteng Provincial Department of Health, Pretoria, South Africa, [2]Anova Health Institute, Johannesburg, South Africa, [3]University of the Witwatersrand, Department of Community Health, School of Public Health, Johannesburg, South Africa, [4]International AIDS Society, Geneva, Switzerland

Background: The United States President's Emergency Plan for AIDS Relief (PEPFAR), through USAID, funded the Accelerating Program Achievements to Control the HIV Epidemic (APACE) award. The purpose of the award was to support the Department of Health to achieve the 95-95-95 goals in Johannesburg District (JHB), with an estimated 623,200 adults living with HIV. APACE activities in JHB ceased immediately following the Stop Work Order on 21st January, with the award terminated in February 2025.

Methods: Routine indicators—HIV tests, HIV positive diagnoses, and ART initiations—were compared across Q1 2023 to 2025 to account for seasonal variation. HIV positivity and initiation rates were calculated. Clinicians recorded visits in standardized paper-based stationery, with data entered in TIER.Net and exported to WebDHIS, from which data was extracted in April 2025.

Results: HIV testing decreased by 8.5% from Q1 2024 to Q1 2025, with a 31% reduction in HIV diagnosis and 30% reduction in ART initiations. HIV positivity declined from 3% to 2.2% while the ART initiation rate remained stable at 81-82%. Figure 1 shows monthly data for Q1 2023-2025.



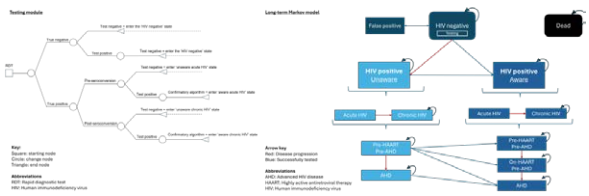
Conclusions: Termination of USAID support resulted in fewer HIV tests and substantially greater reductions in HIV diagnoses and ART initiations in Q1 2025. This likely reflects the loss of key healthcare workers, including counsellors providing index and targeted community-based HIV testing to people most vulnerable to HIV acquisition. The loss of data capturers impaired data capturing and monitoring. While some under-capture of HIV tests is possible, the sharper declines in diagnoses and initiations are considered reliable. Loss of technical support for data analysis and use has also weakened health facilities' ability to respond to the rapidly declining numbers of people living with HIV diagnosed and initiated on ART.

LB26

Accelerating HIV elimination: the role of 4th generation rapid diagnostic tests in Uganda

S. Harper[1], L. Hillcoat[1], A. Whitney[2], M. Lee[2], W. Green[1]
[1]York Health Economics Consortum at the University of York, York, United Kingdom, [2]Abbott, Chicago, United States

Background: 'Acute HIV', the initial stage within the first two-to-four weeks of HIV acquisition, is highly contagious due to the rapid multiplication of the virus and the resulting high viral load. Although 'acute HIV' represents a small portion of overall HIV cases, its high infectivity accounts for approximately 25% of new HIV transmissions. Diagnosing 'acute HIV' infections can play an integral role in reducing onward transmission and improving health outcomes. Current (3rd) generation rapid diagnostic tests (RDTs) only can detect chronic HIV, whereas 4th generation RDTs can detect both acute and chronic HIV.
The objective of this study was to provide novel insight into how acute phase detection may impact overall HIV transmission. A health-economic model was utilized to estimate the impact of introducing 4th generation RDTs in Uganda.
Methods: A health-economic model was developed to analyze the impact of replacing 3rd generation RDTs with 4th generation RDTs in Uganda. The model used a decision tree structure to determine the starting population, and then subsequent months were simulated by having the population move between relevant health states based on testing approach, HIV transmission risk, treatment reception, awareness of HIV status, and mortality risk (Figure 1).



Results: The analysis indicates that introducing 4th generation tests in Uganda will result in detecting 1,800 'acute HIV' cases over 10 years. Additionally, due to the highly infectious nature of 'acute HIV' this translates to over 3,000 HIV cases averted, 600 HIV-caused deaths avoided, and over $18 million USD in total healthcare cost savings relative to using current 3rd generation tests.
Conclusions: This analysis provides important insight into how identifying people in the acute phase – by replacing 3rd generation tests with 4th generation tests – has a multiplicative effect on reducing new HIV cases, thereby lowering the health and economic burden.

LB27

Lessons from implementing a human rights and gender-based harm reduction project for people who use drugs in Rwanda

B. Elvis[1], K. Deborah[2]
[1]Health Development Initiative, Community Health, Kigali, Rwanda, [2]Health Development Initiative, Research, Kigali, Rwanda

Background: The TUBITEHO (Let's Take Care of Them) project is a three-year initiative (Oct 2023–Sept 2026) led by Health Development Initiative (HDI) and partners, aimed at improving the health and rights of People Who Use Drugs (PWUD) in Rwanda. Rooted in a human rights and gender-sensitive approach, the project addresses high HIV prevalence among PWUD (9.05%), which is three times higher than the general population, and barriers to accessing essential health services due to stigma, legal constraints, and criminalization.
Description: Implemented in Gasabo, Nyarugenge, and Rubavu districts, the project has developed and rolled out a peer education network (60 peer educators), trained law enforcement, local leaders, and healthcare providers, and engaged in advocacy with national institutions including the Ministry of Health, the Rwanda Biomedical Center, and security organs. Key interventions include sensitization workshops, development of harm reduction training manuals, and a national mapping and size estimation study on PWUD. Despite disruptions caused by the Mpox and Marburg outbreaks, the project adapted swiftly to ensure continuity.
Lessons learned: Key successes include improved stakeholder collaboration, increased understanding of harm reduction (43.32% knowledge increase among law enforcers), and the establishment of a functioning peer support network. Over 350 PWUD were reached with training on diverse health topics (HIV, Hepatitis B&C, overdose and suicide prevention).
The project initially faced resistance from law enforcers, believing it promoted drug use. Through dialogues explaining the intent, they became supportive. Moving forward, the team prioritizes clear communication to ensure stakeholders understand that TUBITEHO supports access to healthcare for PWUD.
The project also encouraged behavior change; individuals initially hesitant about HIV testing became willing and left knowing their status.
Conclusions/Next steps: The TUBITEHO project demonstrates that integrated harm reduction services grounded in human rights and gender equity can shift perceptions, reduce systemic barriers, and improve access to HIV and related health services for PWUD.
Future steps include disseminating findings from the mapping and baseline studies, refining the national minimum service package for harm reduction, and scaling up interventions through continued multi-sectoral advocacy and policy engagement.

LB28

Telehealth Triumph: Electronic initiation (e-initiation) to reduce linkage loss to Anti-retroviral therapy initiation during the year 2024 among newly diagnosed People living with HIV) in the Northeastern States of India

A. Sekhose[1], R. Haobam[2], Z. Zaiwang[1], S. Rokoviso[1], J. Sanasam[2], T. Jamir[3], R. Kuotsu[3], A. Chakraborty[3], N. Singh[3], L. Ingudum[3], L. Devi[3], P. Deshpande[3], K. Singh[3], S. Todmal[3], C. Murugudu[3], P. Jha[3], A. Hegde[3], S. Chawla[4], U. Sharma[4], S. Upadhyaya[4], P. Nadol[4]

[1]Nagaland State AIDS Control Society, Kohima, India, [2]Manipur State AIDS Control Society, Imphal, India, [3]PATH, New Delhi, India, [4]Division of Global HIV & TB, U.S. Centers for Disease Control and Prevention, New Delhi, India

Background: According to the aggregated data analysis of monthly reports for the period April- Aug 2023 from Nagaland and Manipur states of India, 88% of people living with HIV (PLHIV) aware of their status were on HIV treatment. The gap was primarily due to linkage loss (10%) between testing and treatment facilities. The remote terrain and limited transportation facilities were identified as most common barriers to access treatment facilities. The U.S. President's Emergency Plan for AIDS Relief (PEPFAR) supported project Sashakt provided technical assistance to these states for the electronic-initiation (e-initiation) of Anti-Retroviral Treatment (ART) during the year 2024 at eight HIV testing sites and three ART centers with the highest linkage loss.

Description: E-initiation of ART offers a person-centered approach to strengthen linkage between existing ART Centers with medical officers (MOs) and testing or treatment sites without MOs, for decentralized e-initiation of ART. The MO at ART centers provided technical guidance through virtual platforms (e.g. Zoom) to initiate newly diagnosed PLHIV on treatment at decentralized sites (those without MOs) The health care providers at decentralized sites were trained as per national guidelines for rapid ART initiation and counselling for continuation of treatment. Post initiation, PLHIV visited the decentralized site every month for pill pick-up, adherence and psychosocial support aligned with national guidelines.

Lessons learned: Between April 2023 and September 2024, 110 PLHIV (55% females, 48% >36 years of age) were newly diagnosed at the eight sites; 43% (47/110) were initiated on treatment. The remaining 63 (57%) PLHIV were not able to travel and project staff contacted them telephonically to initiate ART through e-initiation. Among these, 97% (61/63) began ART, leading to an overall 98% linkage rate (108/110). As of September 2024, 89% (54/61) of those who began ART through e-initiation remained on treatment.

Conclusions/Next steps: E-initiation improved rapid treatment initiation among newly diagnosed PLHIV in remote areas, contributing to improved health outcomes while minimizing travel and cost-related barriers. E-initiation of ART could be scaled across other remote and resource-limited settings to advance epidemic control goals.

LB29

PHOENIX Trial: Predictive host omics and epidemiologic networks for integrated exit from HIV Transmission in MENA

H. Tanaka[1], S. Yamamoto[1], G. Rahal[2], A. Abdel-Fattah[3], K. Nassar[4], Y. El-Hadidy[4], T. Sabry[4], F. Zaki[4], O. Khalil[4], L. Barakat[3], S. El-Gazzar[3], N. El-Shenawy[4], R. Sato[1], A. [1]NCGM Disease Control & Prevention Center (DCC), Research Department, 1-chōme-21-1 Toyama, Shinjuku City, Tokyo 162-0052, Japan, Japan, [2]Center for Infectious Diseases Research (CIDR) at the American University of Beirut Medical Center (AUBMC), Research Department, AUBMC, Lebanon, [3]October 6 University, Research Department, Egypt-Cairo, Egypt, [4]Al-Azhar University, Research Department, Egypt-Cairo, Egypt, [5]National Institute of Infectious Diseases, Toyama Research Office, Research Department, 1-chōme-23-1 Toyama, Shinjuku City, Tokyo 162-0052, Japan, Japan, [6]Kalba Hospital, Research Department, Sharjah - Al Saf 8 - Sharjah Emirate - United Arab Emirates, United Arab Emirates, the, [7]Riyadh Clinical Simulation Center, Research Department, Riyadh, Saudi Arabia, [8]Information and Research Center - King Hussein Foundation (IRCKHF), Research Department, 7 Ibrahim Al Bajouri St., Swaifyeh, Amman, Jordan., Jordan, [9]Jordan Hospital, Research Department, An-Nuzha St, Amman, Jordan., Jordan

Background: HIV transmission in the MENA region is rising, driven by delayed diagnosis, stigma, and limited PrEP and ART access. Standard strategies lag behind shifting transmission patterns shaped by migration, urbanization, and conflict.

Precision-guided, region-specific interventions are urgently needed to reverse silent spread and meet global control targets.

Methods: PHOENIX Trial (5-year, 22,000 participants, 6 countries) studies HIV across 4 cohorts: new HIV (6,000), PrEP (4,000), ART-naïve (5,000), controls (7,000). It uses quarterly reviews, digital tracking, biospecimens (WGS, transcriptomics, methylation). A nested RCT (n=3,600) compares Cabotegravir/Rilpivirine vs. Tenofovir for suppression/resistance. AI mHealth/PrEP modules, geo-tagged data, and neural nets predict outbreaks. Bayesian/Cox models analyze suppression, resistance, PrEP failure. Ethics: GDPR-aligned IRBs.

Results: A study of 22,000 participants (91%+ retention, 40.3-month median follow-up) showed:

1. Cabotegravir/Rilpivirine achieved 96.4% virologic suppression in ART-naïve individuals at week 48, surpassing Tenofovir (88.1%, p<0.0001), with a 58% resistance mutation reduction (p=0.002).

2. A 17-gene host signature predicted viral control (AUC 0.93, validated n=620).
3. Mobile nudging increased PrEP adherence by 32.5% (p=0.004) and reduced HIV incidence by 46.2% (p=0.0007).
4. AI risk modeling predicted outbreaks (89.7% sensitivity), preempting surges in Lebanon/Iraq (24.1% cluster reduction).
5. Young males (18-24) had higher nonadherence (OR 3.7; 95% CI 2.6–5.1), prompting tailored outreach recommendations.
6. Novel recombinant HIV clades were identified, requiring cross-border ART coordination. All endpoints were statistically significant (FDR corrected).

Finding	Clinical Implication
Long-acting Cabotegravir/Rilpivirine superior to Tenofovir in sustained viral control (96.4% vs 88.1%)	Supports shifting first-line therapy in eligible populations to long-acting injectable regimens for better long-term outcomes.
58% reduction in resistance mutations with long-acting regimen	May reduce the need for costly genotypic testing and complex salvage regimens, improving care access and cost-effectiveness.
17-gene host signature predicts durable viral suppression (AUC: 0.93)	Opens pathway for precision-guided therapy stratification and personalized treatment planning.
PrEP adherence improved by 32.5% with digital behavioral tools	Validates scalable tech-based adherence supports for real-world application, especially among younger individuals.
46.2% reduction in new seroconversions among digitally supported PrEP users	Strong case for integrating behavioral health platforms in national PrEP rollout strategies.
Neural net outbreak forecasting had 89.7% sensitivity	Enables early deployment of prevention resources in high-risk zones before transmission intensifies.
Reduced expansion rates in Lebanon and Iraq by 24.1% through predictive response	Demonstrates tangible benefit of precision public health in humanitarian and mobile settings.
Stigma-associated nonadherence most marked in males 18–24 (OR 3.7)	Justifies targeted outreach programs and culturally sensitive messaging for key demographic segments.
Discovery of three novel recombinant regional clades	Highlights urgency of harmonized genomic surveillance and coordinated response protocols across neighboring states.

Table 1: Clinical Implications of Key Findings from the PHOENIX Trial

Category	Key Finding	Statistical Significance
Cabotegravir/ Rilpivirine Efficacy	96.4% virologic suppression (ART-naïve, week 48) vs. Tenofovir (88.1%); 58% resistance reduction	p < 0.0001 (suppression), p = 0.002 (resistance)
Host Signature Prediction	17-gene signature predicted viral control (AUC 0.93, validated in n = 620)	High accuracy (AUC 0.93)
Mobile Nudging Impact	+32.5% PrEP adherence; −46.2% HIV incidence	p = 0.004 (adherence), p = 0.0007 (incidence)
AI Outbreak Prediction	89.7% sensitivity in predicting outbreaks; 24.1% cluster reduction in Lebanon/Iraq	Statistically significant (FDR-corrected)
Nonadherence Risk Group	Young males (18–24) had higher nonadherence (OR 3.7; 95% CI 2.6–5.1)	Significant (CI excludes null)
Novel HIV Clades	Recombinant clades identified, necessitating cross-border ART coordination	FDR-corrected significance

Table2: Key Findings from PHOENIX Trial

Conclusions: PHOENIX Trial: Technology-driven HIV management optimizes treatment and prevention across nations. Future studies should focus on long-term AI, genomics, stigma, clade surveillance, cost-effectiveness, implementation, and comorbidities.

LB31

Inclusive or Invisible? A mixed-methods evaluation of SRHR access for LGBTQI+ youth in EECA

U. Batyrgaliev[1]
[1]*ECOM — Eurasian Coalition for Health, Rights, Gender and Sexual Diversity, Tallinn, Estonia*

Background: This study evaluates the sexual and reproductive health and rights (SRHR) needs of LGBTQI+ youth (aged 18–28) across 14 countries in Eastern Europe and Central Asia (EECA). It examines how legal, institutional, and social barriers shape access to SRHR services and addresses urgent gaps in sexuality education, HIV prevention, and gender-affirming healthcare—especially among youth marginalized by sexual orientation, gender identity, socio-economic status, and rural residency.
The research aims to provide timely, community-driven evidence to inform inclusive, youth-led policy reform.
Methods: A mixed-methods approach was used between June and December 2024. A cross-sectional online survey (n = 1,033 valid responses) and 14 semi-structured focus group discussions were conducted with LGBTQI+ youth using purposive and snowball sampling. The study was led by trained youth researchers in partnership with national LGBTQI+ organizations. Quantitative data were analyzed using descriptive and inferential statistics, including logistic and ordinal regression. Qualitative data were thematically coded following Braun & Clarke's framework.
Results: Only 22% of participants received comprehensive sexuality education; 52% had no access. While 60% were aware of PrEP, only 7.9% used it. Access to gender-affirming care was reported as "not easy" by 52%. Comfort in discussing SRHR needs with providers was especially low among transgender and non-binary youth. Urban respondents had better access to services than rural counterparts. The sample included diverse identities: 28% cisgender male, 27% cisgender female, 16% non-binary, 10% transgender male, and 9% transgender female. Gay (30%) and bisexual (26%) youth were the most represented sexual orientations. Age groups 18–19 (23.1%) and 26–28 (22.2%) had the highest representation.
Conclusions: The findings expose systemic SRHR access barriers, particularly for transgender and rural youth, exacerbated by legal restrictions, discrimination, and inadequate provider training.
This study is submitted as a late-breaker due to the novelty and regional scope of the data—collected and analyzed in late 2024—and its relevance to ongoing policy processes. It demonstrates the urgency of institutionalizing gender-affirming care, expanding inclusive sexuality education, and improving PrEP access. Participatory, youth-led advocacy is critical to advancing SRHR equity in the EECA region.

LB32

Psychological impact of analytical treatment interruption on young women enrolled in an HIV cure-related trial in Durban, South Africa

A. Ahmed[1], K.L. Dong[2,3,4], M. Hussain[1], M. Wiseman Ngcobo[5], N. Langa[5], A. Zulu[5], L. Maphalala[6], V. Pillay[6], M. Mthembu[7], W. Tran[1], R. Lau[1], J.K. Stockman[1], T. Ndung'u[2,8,9], K. Dube[1]

[1]University of California San Diego, Division of Infectious Diseases and Global Public Health, School of Medicine, San Diego, United States, [2]Ragon Institute of Massachusetts General Hospital (MGH), Massachusetts Institute of Technology (MIT) and Harvard, Cambridge, MA, USA, Cambridge, United States, [3]MGH, Boston, United States, [4]Harvard Medical School, Cambridge, United States, [5]Integration of TB in Education and Care for HIV/AIDS (ITEACH), Pietermaritzburg, South Africa, [6]Females Rising through Education, Support and Health (FRESH), Durban, South Africa, [7]School of Applied Human Sciences, Department of Social Work, University of Kwa-Zulu Natal (UKZN), Durban, South Africa, [8]Africa Health Research Institute (AHRI), Durban, South Africa, [9]Division of Infection and Immunity, University College London, London, United Kingdom

Background: Analytical treatment interruption (ATI) is an essential tool for assessing HIV cure interventions but poses unique psychological risks. Limited data exist on mental health impact from ATI, with even less known about challenges faced by women and no prior assessment performed in low- and middle-income countries.

For the first time, this study assessed mental health among young women during an ATI-inclusive HIV cure-related trial testing a combination of two broadly neutralizing antibodies, VRC07-523-LS and CAP256V2LS, with a toll-like receptor 7 agonist (Vesatolimod) in Durban, South Africa.

Methods: Twenty women (23–32 years old) participating in an ATI-inclusive trial were co-enrolled in a socio-behavioral study. Mental health was assessed at four time-points during the trial: baseline (T1), pre-ATI (T2), post-ATI (T3), and end of study (T4) using validated scales: decisional certainty (5-item scale), self-esteem (Rosenberg), resilience (2-item measure), anxiety (GAD-7/state anxiety) and depression (PHQ-8).

We identified three distinct virological patterns during ATI, each corresponding to an ART restart group: early (n=7), delayed (n=7), and late (n=6), and stratified analyses accordingly.

Results: Nineteen of 20 completed all study time-points. Decisional certainty increased from a median of 4.70 to 5.00 at trial end (IQR 0.80 and 0.00). Self-esteem remained high (T1 median: 24.5; T4: 26.0), with consistently higher scores in the delayed ART restart group. Resilience scores were stable (median range: 4.50–4.75), with slight increases among early ART restart participants.

Anxiety peaked immediately before ATI (T2 median: 33.3, IQR 11.5), then declined post-ATI (T3: 25.0), with highest anxiety in the late ART restart group.

Depression remained low overall (T1 median: 2.0, IQR 9.8; T4: 4.0, IQR 5.5), but was elevated in the late ART restart group (T1 median: 11.0; T4: 8.0).

Conclusions: ATI was well-tolerated psychologically among young women enrolled in ATI-inclusive HIV cure trial in South Africa. Sustained or improved decisional certainty, self-esteem, and resilience were observed during participation, while increased anxiety and depression were associated with prolonged-ATI (late ART restart). Findings support the inclusion of young women in ATI-inclusive trials but highlight the need for mental health assessments and directed psychosocial support, especially for trials that include prolonged ATIs.

LB33

Too vital to fail: national survey reveals sustainability risks facing HIV-serving organizations in the United States

K. Keith[1], A.T. Young[2]

[1]Community Education Group, Special Projects, Lost River, United States, [2]Community Education Group, Lost River, United States

Background: HIV-serving organizations (HSOs) provide critical prevention, care, and harm reduction services in rural and underserved communities. Yet mounting financial pressures, federal policy changes, and workforce burnout threaten their long-term viability. In 2025, the Community Education Group launched a national survey to assess the sustainability of HSOs, examining their dependency on federal funding, financial outlook, and readiness to adopt adaptive strategies.

Methods: A confidential, web-based survey was conducted between March 11 and April 7, 2025 across the U.S. and territories. 41 respondents included community-based organizations, health departments, FQHCs, and harm reduction coalitions. The survey combined multiple-choice and open-ended questions focused on service delivery models, budget allocations, federal dependency, organizational needs, and openness to restructuring. Data were analyzed using descriptive and thematic methods.

Results: All respondents provide HIV services, with 33 offering HCV testing—demonstrating widespread syndemic care integration. Budget allocations revealed a polarized field: 16 dedicate less than 25% of budgets to HIV services, while 14 allocate 75% or more.

Nearly all respondents rely on federal funding, yet most reported they could maintain HIV-related operations for 90 days or less without it. Few respondents mentioned the 340B Drug Pricing Program, those who did called it essential for supporting outreach, mobile services, and culturally responsive care.Confusion persists about its classification and long-term viability.

Approximately 71% expressed openness to adaptive strategies such as mergers, shared services, or restructuring—though most lack formal plans or resources to act. The top organizational needs were financial sustainability, capacity-building, policy and advocacy guidance, and emergency financial and legal assistance related to partner instability. Rural respondents emphasized any loss of federal support would destabilize broader service ecosystems, disrupting not only HIV care but also access to housing, mental health, and transportation services.

Conclusions: HSOs operate on fragile financial margins, and the loss of federal HIV funding—whether direct or indirect (via 340B)—would have cascading effects across public health infrastructure. The field is ready to explore adaptive models, but requires technical, legal, and financial support to do so effectively. Sustaining these organizations is essential to maintaining HIV care continuity and advancing national End the Epidemic goals.

LB34

Identifying factors influencing HIV testing behavior among High-Risk elderly men: a mixed-methods study incorporating structural equation modeling and thematic framework analysis

W. Yalan[1], T. Renhai[2], Z. Qunbo[2], Y. Yuecheng[2], D. Song[2], W. Junjie[1], S. Duo[1]
[1]National Center for AIDS/STD Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China, [2]AIDS Prevention and Control Department, Dehong Dai and Jingpo Autonomous Prefecture Center for Disease Control and Prevention, Yunnan Province, Dehong, China

Background: Despite China's continuous efforts to strengthen HIV testing, proactive testing rate remains significantly low. This study identifies key factors influencing HIV testing behavior among high-risk elderly and exploring the underlying mechanisms and sociocultural contexts to inform targeted interventions.
Methods: An explanatory sequential mixed-methods design was employed.
Quantitative (September–December 2024): 300 high-risk men aged ≥50 were recruited by non-probability sampling in Dehong Prefecture, Yunnan Province, China's first region to achieve the „90-90-90" targets. Face-to-face surveys collected sociodemographic characteristics, HIV knowledge, risk behaviors, and testing history. A 30-item scale was developed based on the Information-Motivation-Behavioral Skills model and Self-Determination Theory to assess influencing factors. Exploratory factor analysis (SPSS 25.0) and SEM (AMOS 24.0) assessed pathways and effect sizes.
Qualitative (January–February 2025): 30 typical participants were purposively sampled. Semi-structured in-depth interviews were transcribed, coded using NVivo 12 and thematically analyzed to contextualize quantitative results.
Results: Quantitative analysis revealed an HIV testing rate of 57.7%, with 68.2% passive. Among participants, non-commercial sex with non-regular partners was reported by 56.0%, 31.0% of these forwent condoms due to reduced pleasure (42.3%).
Commercial sex was reported by 85.3%—44.4% of non-condom users cited the same reason. SEM analysis identified **self-efficacy as the strongest positive predictor** (**total effect = 0.32**, **p<0.05**), while **behavioral skills (-0.21, p<0.05) and HIV information (-0.20, p<0.05) exhibited significant negative effects**. The model fit was acceptable (RMSEA=0.073, CFI=0.94). Qualitative findings further elucidated underlying mechanisms.
Self-efficacy: high self-efficacy was reinforced by „peer success stories," while low self-efficacy shaped by stigma associated testing with „moral corruption".
Behavioral skills: Operational barriers, such as complicated self-testing procedures, small font sizes and privacy concerns, hindered testing.
HIV information: overemphasis on fatality messaging triggered psychological defense mechanisms. Additionally, information dissemination channels were misaligned with older adults' media consumption habits. Rural communities widely perceived HIV as a "young disease," further dampening testing motivation.
Conclusions: Self-efficacy facilitates HIV testing among high-risk elderly men, whereas usability issues, ineffective messaging strategies, and cultural perceptions suppress testing behavior. Interventions should focus on enhancing self-efficacy, optimizing age-friendly self-testing tools, adopting non-fear-based messaging strategies, and integrating HIV screening into chronic disease check-ups to break cultural biases.

LB35

Risk of conscription affects engagement of sexual minority men in care in Ukraine

M. Mansouri[1], M. Filippovych[2], A. Trovato[1], B.P. Skaathun[3], J.O. Wertheim[3], I. Koutsenok[4], S.R. Friedman[5], P. Smyrnov[2], T.I. Vasylyeva[1]
[1]UC Irvine, Population Health and Disease Prevention, Irvine, United States, [2]Alliance for Public Health, Kyiv, Ukraine, [3]UC San Diego, Division of Infectious Diseases and Global Public Health, School of Medicine, San Diego, United States, [4]UC San Diego, Department of Psychiatry, San Diego, United States, [5]New York University, Department of Population Health, Grossman School of Medicine, New York, United States

Background: Sexual minority men (SMM) are the only group with rising HIV incidence in Ukraine. With 3.7 million remaining internally displaced as of February 2025 due to the Russian invasion, and all men aged 25-60 being eligible for conscription for military service, engagement of SMM, including forcibly displaced SMM (fdSMM), in HIV care remains a priority to prevent the rise of HIV during and after the war.
Methods: We analyzed preliminary data from an on-going cohort study of SMM in Ukraine, which started in November 2024 and recruited 717 participants as of April 2025. Participants were asked about their HIV risk behaviors, including health seeking behaviors, and administered a social network inventory and a rapid HIV test with subsequent dried blood spot (DBS) sample collection in the case of a positive result.
Associations between displacement status and reasons to not seek medical care (including HIV care) were explored using bivariate logistic regression.
Results: Half of the study sample was forcibly displaced (n=368, 51%); at the time of the survey, the majority was never married (n=654, 91%), lived in their own apartment (n=554, 77%), had education beyond high school level (n=646, 83%), and were getting by financially (n=520, 73%).

N=46 (6.4%) tested positive for HIV. The most common reason for SMM to avoid any medical care (regardless of the HIV status or other comorbidities) in the last 6 months was risk of conscription (n=308, 43%), with the majority saying they specifically fear being conscripted on the way to the clinic (n=302, 98%).
Risk of conscription was also the most common reason for SMM to avoid HIV-specific services (n=249, 35%). Forcibly displaced SMM were more likely compared to local SMM to avoid HIV care for fear of medical staff sharing their information with the military (10% vs 6%, OR=1.72, 95%CI 0.97 – 3.05).
Conclusions: Risk of conscription on the way to a hospital/clinic is impacting Ukrainian SMM's ability to access HIV-specific and general medical care. Novel ways to deliver HIV services need to be developed in the reality of the war to improve access to care for SMM in Ukraine.

LB36

Internalised homonegativity among men-who-have-sex-with-men and its associations with societal stigma, policy environments and HIV risk in 41 European countries

S. Aijaz Khan[1], P. Vickerman[1], F. Hickson[2], P. Weatherburn[2], A. J Schmid[2], D. Gillespie[3], K. Hood[3], J. Nicholls[4], J. Stone[1]
[1]University of Bristol, Bristol Medical School, Bristol, United Kingdom, [2]London School of Hygiene & Tropical Medicine, Sigma Research, Department of Public Health, Environments & Society, London, United Kingdom, [3]Cardiff University, Centre for Trials Research, College of Biomedical & Life Sciences, Cardiff, United Kingdom, [4]Cardiff University, Cardiff and Vale University Health Board Sexual Health Service, Cardiff, United Kingdom

Background: Among men-who-have-sex-with-men (MSM), internalised homonegativity (IH) is theorised to influence HIV risk. We quantified levels of IH among MSM and assessed associations with societal stigma and sexual and health-related outcomes.
Methods: We analysed data from 49,267 MSM in 41 countries participating in the 2017 European MSM Internet Survey, a self-selecting online sexual health needs assessment. IH was assessed using the short internalised homonegativity scale (range 0-low to 6-high). We calculated median IH score for countries and assessed correlation with countries' Rainbow Index (RI), a measure of LGBTI policy environments (range: 0-repressive to 100-liberal).
We assessed ecological and individual-level associations between IH and experience of homophobic societal stigma, depression, suicide ideation, HIV risk behaviours, HIV testing history, treatment and prevention uptake.
We used linear and multi-level logistic regression models (adjusted for age, education, and sexuality identity) with random intercepts for country and recruitment source.
Results: Country's median IH score varied between 0.93-2.8 and was negatively correlated with RI (R^2=0.54) (figure). At individual level, higher IH levels were negatively associated with past year experiences of homophobic intimidation (AOR=0.87, 95%CI:0.86-0.88), verbal insults (AOR=0.85, 95%CI:0.84-0.87), and physical assault (AOR=0.90, 95%CI:0.88-0.93), and positively associated with depression (AOR=1.19, 95%CI:1.17-1.21) and suicide ideation (AOR=1.26, 95%CI:1.23-1.28).
IH score was associated with lower odds of having ever had anal sex with men (AOR=0.79, 95%CI:0.76-0.82), having a steady (AOR=0.78, 95%CI:0.77-0.80) or non-steady male partner in past year (AOR= 0.92, 95%CI:0.90-0.94), engaging in chemsex in past year (AOR= 0.82, 95%CI:0.80-0.85), ever using illicit (AOR= 0.82, 95%CI:0.80-0.83) or injectable drugs (AOR= 0.91, 95%CI:0.86-0.97).
IH was associated with lower odds of HIV infection (AOR=0.88, 95%CI:0.85-0.91), being offered (AOR=0.86, 95%CI:0.80-0.92) and receiving an HIV test in past year (AOR=0.93, 95%CI:0.90-0.95), and lifetime PrEP use (AOR=0.78, 95%CI:0.74-0.83). IH was not associated with ART use. Ecological analyses were broadly consistent with these findings.
Conclusions: Levels of IH vary across Europe and are associated with LGBTI policy environments. The complexity highlights its potential impact on the well-being of MSM, influencing both HIV prevention and treatment uptake and mental health outcomes. This underscores the critical importance of fostering inclusive policies to reduce IH among MSM to improve health outcomes.

LB37

Systemic reproductive coercion and rights violations among women living with HIV across twenty-three countries.

K. Dunaway[1], S. Brion[1], G. Turpin[2], C. Lyons[2], I. Owomugisha[1], C. Mkona[1], M. Iacono[3], R. Gonzalez[4], D. Weekes[5], S. Shahi[6], O. Stryzhak[7], H. Esquivel[8]
[1]International Community of Women Living with HIV (ICW), Johannesburg, South Africa, [2]John Hopkins University, Baltimore, United States, [3]ICW Latina, Buenos Aires, Argentina, [4]Llaves Organization, San Pedro Sula, Honduras, [5]Trinidad and Tobago Community for Positive Women (TTCW+), Port of Spain, Trinidad and Tobago, [6]ICWAP, Bangkok, Thailand, [7]Eurasian Women's Network on AIDS, Kyiv, Ukraine, [8]ICW Latina, Mexico City, Mexico

Background: Despite scientific advances and global recognition of sexual and reproductive health and rights, women living with HIV continue to experience violations in healthcare settings. These include not only forced sterilization but also routine coercive practices such as pressure to use certain contraceptives, discouragement from pregnancy, or denial of infant feeding options.
Such interventions are often presented as medically justified but undermine autonomy and informed consent. These violations reflect broader systemic failures in policy and practice, particularly in the care of marginalized populations.
Methods: This mixed-methods study, led by the International Community of Women Living with HIV, was conducted between 2020 and 2023 across 23 countries. Data sources included an online qualitative survey, 34 in-depth interviews with women, trans, and gender-diverse people living with HIV, a scoping review of grey and academic literature, and a gender analysis of aggregated data from

26,502 women in the Stigma Index 2.0. Thematic analysis explored patterns of reproductive coercion across contraception, pregnancy, childbirth, and infant feeding, with attention to structural and legal barriers.

Results: Nearly one in five respondents reported experiencing reproductive coercion. These experiences were most common during pregnancy and breastfeeding care and disproportionately affected sex workers, migrants, women who use drugs, and women with disabilities.

The data showed widespread lack of informed consent, denial of care, discriminatory practices, and outdated clinical guidance. About 14% of those affected had reported violations, citing fear, stigma, or lack of accessible reporting mechanisms.

Conclusions: Reproductive coercion in HIV care is not limited to individual misconduct but reflects systemic patterns of control, exclusion, and gendered stigma. Policies, clinical protocols, and legal environments must be updated in line with current evidence and international human rights standards.

This study contributes actionable evidence to inform health system reform, provider training, rights-based policymaking, and legal accountability. Centering the lived experiences of women living with HIV is essential to transforming reproductive healthcare and ensuring justice in HIV responses globally.

LB38

"I'm tired of taking pills every day": participants' choices and experiences of the Cabotegravir plus Rilpivirine Long-Acting (CAB + RPV LA) efficacy and safety trial in sub-Saharan Africa (CARES)

E.-L. Durden[1], D. Kaawa-Mafigiri[2], A. Mulwo[3], N. Gumede[1], I.K. Mambule[4,5], K. Opiyo[4], C. Kityo[4], N.I. Patton[6], K. Mulungu[4], L. Klasko-Foster[7], S. Asasira[8], A. Alinaitwe[9], M. Okwero[10], P. Onyango[11], V. Kirui[12], M. Omol[13], N. Tom[14], N. Jeenarain[15], A. Idahosa[16], I. Eshun-Wilsonova[17], F. Addo Boateng[18,19]

[1]University of KwaZulu-Natal, Centre for Communication and Media in Society, Durban, South Africa, [2]Makerere University, School of Social Sciences, Kampala, Uganda, [3]Moi University, School of Information Sciences, Eldoret, Kenya, [4]Joint Clinical Research Centre, Kampala, Uganda, [5]Liverpool School of Tropical Medicine, Clinical Sciences department, Liverpool, United Kingdom, [6]National University of Singapore, Infectious Diseases Translational Research Programme and Department of Medicine,, Singapore, Singapore, [7]Johnson&Johnson Global Health Equity, New Brunswick, United States, [8]Joint Clinical Research Centre, Lubowa, Kampala, Uganda, [9]Joint Clinical Research Centre, Fort Portal, Kampala, Uganda, [10]Infectious Diseases Institute, Kampala, Uganda, [11]Aga Khan University Hospital, Nairobi, Kenya, [12]Moi University School of Medicine, Eldoret, Kenya, [13]Kenya Medical Research Institute/US Army Medical Research Directorate, Kericho, Kenya, [14]University of the Witwatersrand, Ezintsha, Faculty of Health Sciences, Johannesburg, South Africa, [15]Chatsworth Clinical Research Site, South African Medical Research Council (SAMRC), Durban, South Africa, [16]Johnson & Johnson Company West Africa Ltd, Accra, Ghana, [17]Johnson & Johnson, Cape Town, South Africa, [18]Johnson & Johnson Middle East FZ LLC, Accra, Ghana, [19]Novartis Ghana Limited, Accra, Ghana

Background: The search for acceptable anti-retroviral treatment (ART) options is ongoing. Daily oral ART does not suit all clients, and injectable cabotegravir and rilpivirine long-acting regimen (CAB +RPV LA) has shown to be an acceptable and desirable option in high-income settings.

This qualitative sub-study, conducted as part of the CARES Phase 3b trial in three sub-Saharan African countries, explored participants' experiences with this treatment option for people living with HIV in this context.

Methods: Research was conducted in 2023 with 172 consenting African participants [96 females (56%) and 76 males (44%)] coming to the end of the 96-week study across eight sites in Kenya, Uganda and South Africa. 133 in-depth interviews were conducted with 69 participants (52%) from the standard of care (SOC) arm and 64 (48%) from the intervention arm.

An additional four focus group discussions were conducted with a total of 39 participants. Interviews and discussions were recorded and transcribed, and thematic analysis undertaken, with Atlas TI software used for data coding.

Results: Despite prior concerns regarding injection pain and likely efficacy of the injection, 100% (69/69) of interviewed participants from the trial intervention arm

expressed positive attitudes about the long-acting injectable (LAI) and would prefer to stay on it indefinitely. These participants associated the injection with less worry, reduced social stigma, improved health, and greater convenience. 78% (50/64) of interviewed SOC participants expressed a willingness to switch to the injection.
Perceptions of reduced pill burden, increased privacy, convenience, effectiveness and the competence of healthcare workers were cited as factors to consider when making the choice to switch.
Those who expressed a reluctance to switch to LAI (20%) highlighted the familiarity and convenience of oral ART, and a lack of knowledge about the injection, with fears about pain, efficacy and availability.
Conclusions: These findings highlight the importance of client choice in ART, with experienced participants expressing a preference for LAI and desire to switch to injectable ART among SOC participants. In sub-Saharan Africa, where stigma and adherence challenges persist, LAI could improve treatment outcomes.
Addressing concerns through client education and effective systems and services are important for expanding choice to include LAI.

LB39

Predicting viral non-suppression in REMAIN, a digital cohort of people living with HIV in the United States

N.E. Rosenberg[1], X. Tan[1], M. Javanbankht[2], V. El-Alfi[2], C. Crews[3], A. Rochelle[3], H. Patani[4], Y. Granados[4], J. Spector[1], K.E. Muessig[3], S.D. Young[5], L. Hightow-Weidman[3], P.M. Gorbach[2]
[1]University of North Carolina at Chapel Hill, Chapel Hill, United States, [2]University of California, Los Angeles, Los Angeles, United States, [3]Florida State University, Tallahassee, United States, [4]AIDS Healthcare Foundation, Los Angeles, United States, [5]University of California, Irvine, Irvine, United States

Background: Although antiretroviral therapy (ART) is widely available in the United States, a large share of people living with HIV (PLHIV) remain virally non-suppressed. Understanding the factors that put PLHIV at risk for HIV viral non-suppression could offer opportunities for targeted HIV treatment interventions. In a digital cohort of PLHIV, we modeled associations between baseline covariates and viral non-suppression.
Methods: REMAIN is an app-based digital cohort following PLHIV in the United States. Between February 2024 and March 2025 1032 PLHIV were recruited through online dating sites, social media, and AIDS Healthcare Foundation HIV clinics. PLHIV were eligible if they were ≥18 years, spoke English or Spanish, had access to a smart phone, and had risk for non-suppression. Baseline variables included demographic, HIV treatment, substance use, sexual activity, adherence self-efficacy items, and mental health characteristics. The relationships between baseline characteristics and HIV viral non-suppression were examined through bivariable regression and multivariable elastic net modeling.
Results: Seven hundred forty-two participants had viral load results ascertained at baseline. Of these, 36% (268/742) had an unsuppressed viral load (≥200 copies). Median age was 37 years. In bivariable analysis, the odds of viral non-suppression were higher among those who were younger, had sex with men, and reported specific mental health or adherence self-efficacy challenges.
Other demographic, behavioral and substance use covariates were not significantly associated with viral non-suppression. The multivariate model was moderately predictive with an area under the receiver-operating characteristic curve (AUC) of 0.75 (95% CI: 0.71-0.79).
Conclusions: Over one-third of PLHIV in this digitally-recruited cohort were not virally suppressed. While several characteristics emerged as predictors of viral non-suppression, their predictive capacity was only moderate. These results underscore the need to examine real-time dynamic factors influencing ART non-adherence and viral non-suppression. Leveraging the REMAIN cohort, future work will explore interventions tailored to changing time-varying adherence predictors, moving us closer to sustained viral suppression and improved health outcomes for PLHIV.

LB40

Bridging faith and public health: a youth-driven, rights-based approach to TB prevention in South African faith communities

M. Msomi[1]
[1]Civil Society Forum, Faith Based Sector, Johannesburg, South Africa

Background: Despite South Africa's extensive TB response, youth engagement in TB prevention remains limited, particularly within marginalized and faith-based communities. Structural and cultural barriers, including generational hierarchies, stigma, and misinformation, often exclude young people from health decision-making. Faith-Based Organizations while trusted and deeply embedded in communities, remain underutilized in TB strategies.
This study sought to explore how youth from diverse faith communities perceive TB and to co-design participatory, culturally anchored, and rights-based approaches to TB prevention.
Description: A qualitative exploratory study was conducted between 2023–2024 in Johannesburg with 38 youth (ages 18–30) from Christian, Muslim, and Rastafarian communities. Five focus group discussions (FGDs) were facilitated using a semi-structured guide developed through Community-Based Participatory Research (CBPR) and Human-Centered Design (HCD) principles. Specifically, the "Define" and "Develop" phases of the Double Diamond model were applied to co-create intervention ideas. Data were thematically analyzed through affinity diagramming and cross-case analysis, using Mural collaborative boards to support youth-led synthesis and validation.
Lessons learned: Participants viewed TB as both a medical and social justice issue, citing stigma, misinformation, and passive institutional messaging as key barriers. Youth highlighted FBOs as powerful platforms for TB educa-

tion, but noted resistance from conservative leadership structures. Proposed interventions included faith-aligned health clubs, music and spoken word campaigns, drama-based advocacy, and WhatsApp-driven peer support networks. Importantly, participants framed TB prevention as a matter of dignity, participation, and intergenerational equity. The study also revealed a readiness among youth to lead but a lack of institutional frameworks to support them

Conclusions/Next steps: Faith-based TB prevention must move beyond top-down health messaging to embrace youth agency, cultural resonance, and community co-ownership. Embedding human rights principles including participation, accountability, and non-discrimination into FBO-public health partnerships can transform TB responses in underserved areas. Policymakers should invest in youth leadership pipelines, co-design methodologies, and integrated training for FBOs to align spiritual care with public health equity.

LB41

Improving HIV risk assessment among Black women: A machine learning HIV prediction model in Atlanta, Georgia

M. Schwinne[1,2], V. Cantos[3], C. Robichaux[1,2], S. Gruber[3], R. Ithya[2], E. Hollenberg[4], M. Lora[3]

[1]Emory University, Biomedical Informatics, Atlanta, United States, [2]Georgia Clinical and Translational Science Alliance, Emory University School of Medicine, Atlanta, United States, [3]Emory University, Department of Medicine, Atlanta, United States, [4]Hospital of the University of Pennsylvania, Department of Medicine, Philadelphia, United States

Background: Accurately identifying HIV risk in women is crucial to increase HIV pre-exposure prophylaxis (PrEP) usage but is complicated by the complex interplay of non-behavioral factors. HIV prediction models may bridge this gap, but prior models have been less accurate in women, particularly Black women.

Methods: We developed an electronic health record (EHR)-based machine learning model to predict HIV diagnosis in women. We included adult persons with female sex seen at the Grady Health System between 2012 and 2022. We identified 180 EHR features as potential predictors, including novel sociostructural and healthcare utilization features. We selected features using LASSO regression and trained the model with an XGBoost classifier. We evaluated model performance using area under the receiver operating characteristic curve and precision-recall curve (AUROC, AUPRC). We used Shapley additive explanations (SHAP) to quantify the importance of each included feature to the model.

Results: Of 333,263 eligible women, 617 (0.19%) had an incident HIV diagnosis, 551 (89%) who identified as Black. The model AUROC was 0.85 +/- 0.02 and AUPRC was 0.08. The most significant predictors for HIV were younger age, seeking HIV screening, Black race, fewer healthcare encounters, residing in high HIV incidence zip codes, and frequent changes to phone number or address. Seeking sexual health services was more predictive than STI positivity.

Figure 2. Feature Contributions to Model Predictions (SHAP Values)

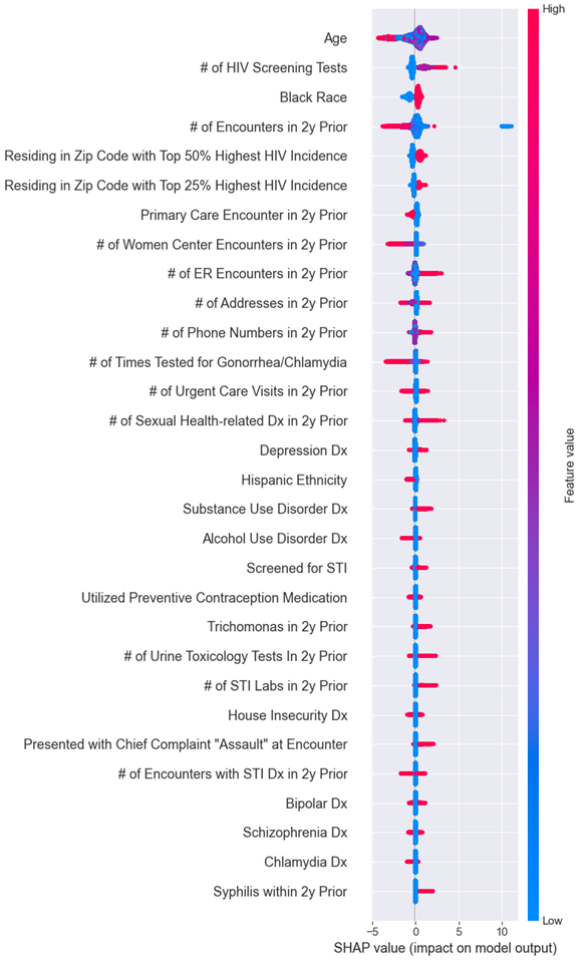

Figure 1: AUROC and AUPRC

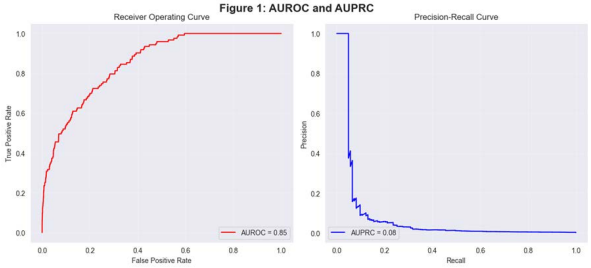

Conclusions: Our model demonstrated a high discriminatory ability in predicting HIV among women in a predominantly Black population. We hypothesize that adding structural and healthcare utilization features and being in an area with high HIV incidence led to higher model accuracy.

LB42

Cutting costs without cutting care: the cost and impact of substituting provider-administered HIV testing with HIV self-testing at facilities

B.E. Nichols[1,2], J.W. Imai-Eaton[3], O. Edun[4], A. Bershteyn[5], C.C. Johnson[4]

[1]Boston University School of Public Health, Department of Global Health, Boston, United States, [2]Amsterdam University Medical Center, Department of Global Health, Amsterdam, Netherlands, the, [3]Harvard T.H. Chan School of Public Health, Center for Communicable Disease Dynamics, Department of Epidemiology, Boston, United States, [4]World Health Organization, Geneva, Switzerland, [5]New York University Grossman School of Medicine, Department of Population Health, New York City, United States

Background: With increasingly constrained HIV-related funding and human resources, HIV programmes are considering more flexible and efficient testing options. We modeled the cost and human resource implications of substituting provider-administered HIV testing with HIV self-testing (HIVST) for the first assay in facility-based testing.

Methods: We developed a static model of the HIV testing continuum, incorporating initial screening (provider-based or HIVST in facilities), two confirmatory tests for reactive results, and varying final treatment initiation rates by testing modality (89% for HIVST and 93% for provider-administered) based on literature.

We compared two scenarios to explore bounds of impact: (1) 5 million provider-administered tests, (2) 5 million facility-based HIVST. Outcomes included: confirmed HIV diagnoses, ART initiations, total cost, and staff-time required.

We assumed 2.5% prevalence among testers, and test costs of $0.80 (provider-based), $1.60 (confirmation), and $1.50 (HIVST); provider-time ($0.06/minute) differed by test type: 20 minutes/HIV-negative provider-administered test, 2 minutes/HIV-negative HIVST.

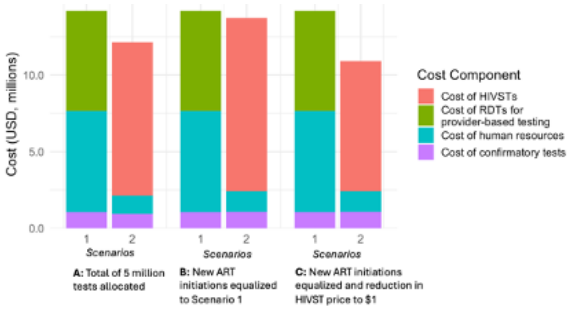

Figure. Total cost, by component, of HIVST vs provider-testing scenarios.

Results: ART initiations totalled 113,925 and 100,731 across scenarios 1 and 2 respectively. Total costs were $14.2M, and $12.1M (−15%). Total staff-time required for testing fell by 85% in Scenario 2 vs. Scenario 1.

To match Scenario 1's ART initiations, Scenario 2 would require 655,000 additional HIVST kits to achieve a similar testing yield due to linkage to care reductions associated with HIVST. Even with compensatory HIVST scale-up, total costs remained lower (-3.0%), as did total staff-time (-80%). If HIVST unit cost dropped to $1, to match the same ART initiations as Scenario 1, Scenario 2 would cost $10.9M (−23%).

Conclusions: HIVST for initial screening in facility-based HIV testing substantially reduces cost and staff burden—especially critical in the face of global funding cuts and health workforce shortages.

With sustained testing yield and cost reductions, HIVST offers a flexible option to maintain timely diagnosis and treatment while easing both financial and operational pressures.

LB43

Global ripple effects: the ramifications of ending PEPFAR and USAID on HIV equity, sustainability, and surveillance

K. Keith[1], A.T. Young[2], P. Oliva[1]

[1]Community Education Group, Special Projects, Lost River, United States, [2]Community Education Group, Lost River, United States

Background: Since its launch in 2003, the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) has saved over 25 million lives and catalyzed the most expansive global response to HIV/AIDS. Yet in March 2024, Congress passed a short-term omnibus funding bill that reauthorized PEPFAR only through March 25, 2025. This instability threatens to reverse two decades of progress and disrupt a global network of HIV service delivery, data infrastructure, and local capacity that includes USAID's pivotal role.

This abstract explores how the collapse or curtailment of PEPFAR and USAID support would dismantle equitable service delivery, economic stability, and scientific progress globally.

Methods: We conducted a multi-level review of public reports, surveillance data, and published analyses to assess the programmatic, socio-economic, and structural implications of ending PEPFAR and USAID. We examined PEPFAR's 2022 Five-Year Strategy and analyzed data on workforce training, HIV incidence, and economic spillovers to quantify potential setbacks. Key U.S. and international sources were reviewed to triangulate program scale and projected losses.

Results:

- In FY2023, PEPFAR supported 327,000 community health workers globally—many of whom are at risk of job loss due to budget uncertainty.
- The $40 million LIFT UP investment for key populations in 2023, alongside a planned $14 million for 2024–2025, may be jeopardized, undermining HIV prevention and treatment access.
- Discontinuation of USAID's Global Health Supply Chain Program would directly impair access to diagnostics, antiretrovirals, and test kits across low- and middle-income countries.
- Economic modeling by KFF (2022) shows that PEPFAR participation led to a 2.1 percentage point increase in GDP growth per capita and reductions in out-of-school rates—benefits that could be reversed.

- Surveillance infrastructure and public-private partnerships facilitated by PEPFAR risk collapse, stalling the achievement of global targets such as 95-95-95 and limiting the ability to monitor emergent threats.

Conclusions: The non-renewal or further politicization of PEPFAR and USAID would severely compromise global HIV progress—particularly among women, youth, and key populations—and unravel long-standing gains in public health capacity, equity, and science. Beyond clinical impact, the loss of these programs would reduce employment, education, and economic resilience across entire regions.

LB44

Real-time implementation of HIV viral load dashboards in rural Nigeria: a quality improvement pilot across three facilities in Delta state

O. Akusu[1]
[1]National AIDS & STIs Control Programme (NASCP), State Clinical Mentor, Delta State, Kwalle, Nigeria

Background: Persistent gaps between viral load (VL) data availability and clinical decision-making in rural Nigeria impede progress toward achieving UNAIDS 95-95-95 targets. Despite the existence of digital repositories like the National Data Repository (NDR), frontline use of real-time VL information remains limited. This project piloted a dashboard intervention to enhance VL data utilization and quality improvement (QI) in three rural ART clinics in Delta State, Nigeria.

Description: Between January and March 2025, customized, facility-level VL dashboards were deployed in GH Obiaruku, Brema Specialist Hospital, and GH Ashaka using NDR-derived data. Clinical teams were trained to use dashboards for client prioritization and tracking. Bi-weekly onsite mentorship sessions were conducted to support QI cycle development focused on managing viremic clients and optimizing suppression outcomes. Monthly reviews of suppression trends and facility-level action plans were integrated into routine care processes.

Lessons learned: Across the three facilities, 1,486 people living with HIV (PLHIV) were on ART, with 448 viral load results available.

- Baseline suppression rates were 78.6% (GH Obiaruku), 86.6% (Brema Specialist Hospital), and 99% (GH Ashaka).
- Among 10 clients with VL >1000 copies/ml, 80% received enhanced adherence counseling, and 60% underwent repeat VL testing.
- Facility QI teams initiated active case conferencing and prioritized high VL client management, supported by real-time dashboard insights.
- Clinical teams reported improved workflow efficiency, rapid decision-making, and stronger client monitoring.

Conclusions/Next steps: Implementing real-time VL dashboards combined with structured mentorship and QI cycles was feasible and highly acceptable in rural Nigerian ART settings. Early outcomes suggest meaningful shifts in clinical prioritization, client follow-up, and maintenance of high suppression rates. Scaling up this dashboard-driven approach across similar under-served settings could significantly accelerate achievement of national and global HIV viral suppression targets.

LB45

Resilient HIV response in Peru: advancing person-centered care through national ART decentralization post-COVID-19

R. Terán[1], A. Vera[1], A. García[1], N. Romero[1], E. Olortegui[1], G. Cisneros[2], L. Lecca[2], A. Mendoza-Ticona[2], C. Díaz-Vélez[3], C. Benites[1]
[1]Ministerio de Salud de Perú, Dirección de Prevención y Control de VIH, ITS y hepatitis, Lima, Peru, [2]Socios En Salud Sucursal Peru, Lima, Peru, [3]Ministerio de Salud de Perú, Dirección General de Intervenciones Estratégicas en Salud, Lima, Peru

Background: Since 2004, Peru's Ministry of Health has provided free antiretroviral treatment (ART) to people living with HIV (PLHIV), mainly through hospital-based services. However, the COVID-19 pandemic exposed critical gaps in centralized care, particularly for rural and underserved populations. In response, Peru accelerated the decentralization of ART to primary health care (PHC) facilities, bringing services closer to where people live.

Description: In 2020, a national policy was launched to decentralize ART delivery through a person-centered approach, prioritizing:

- Selection of PHC sites based on HIV burden and access barriers.
- Advocacy with regional and local health authorities to secure alignment and commitment.
- Capacity building for health workers through blended learning, mentorship, and in-service training.
- Technical support for reorganizing service delivery and patient pathways.
- Integration of domestic and international resources (e.g., Global Fund) for sustainable financing.
- Strengthening ART logistics (with TLD regimens), scaling up molecular viral load testing (GeneXpert), and implementing an electronic health record system (SIHCE-VIH).

A comparative analysis of ART coverage from 2019 (pre-COVID-19) to 2024 is presented in the following table.

	2019	2024	Increase
ART-providing centers	163	368	205 (126%)
Primary health care level	49 (30.1%)	225 (61.1%)	176 (359%)
Secondary health care level	82 (50.3%)	103 (28.0%)	21 (25%)
Tertiary health care level	32 (19.6%)	40 (10.9%)	8 (25%)
PLHIV on ART	67,214	100,061	32,847 (49%)
Primary health care level	10,585 (15.8%)	28,948 (28.9%)	18,363(173%)
Secondary health care level	13,873 (20.6%)	26,646 (26.6%)	12,773 (92%)
Tertiary health care level	42,756 (63.6%)	44,467 (44.5%)	1,711 (4%)
Provinces with at least one ART health care center	57/196 (29.1%)	130/196 (66.3%)	73 (128%)

Lessons learned: • A strong regulatory framework enabled the scale-up of decentralized services.

- Regional leadership engagement was key to sustainability.
- Trained, sensitized local teams provided accessible, stigma-free HIV care.
- Leveraging international cooperation complemented public funding.
- Simplified regimens and point-of-care diagnostics facilitated rapid service expansion.

Conclusions/Next steps: ART decentralization strengthened Peru's HIV response by improving access, equity, and continuity of care. Between 2019 and 2024, the number of ART-providing PHC centers increased by 359% (from 49 to 225), with nearly one-third of PLHIV now receiving treatment at PHC facilities. This approach enhanced health system resilience, ensuring that PLHIV remained at the center of the response during and after the COVID-19 pandemic.

LB46

Expanding pre-exposure prophylaxis (PrEP) access and continuity through differentiated service delivery models for key populations (KP) in Vietnam

H. Phan[1], K. Green[2], T. Tran[3], D. Canagasabey[4], L. Tran[3], K. Do[5], T. Le[6], T. Nguyen[7]

[1]Hanoi Medical University, Hanoi Medical University Council, Hanoi, Viet Nam, [2]PATH, Primary Health Care, Geneva, Switzerland, [3]PATH, STEPS, Hanoi, Viet Nam, [4]PATH, Primary Health Care, Washington DC, United States, [5]Galant clinic, clinic, Hanoi, Viet Nam, [6]Glink clinic, clinic, Hanoi, Viet Nam, [7]AloCare clinic, clinic, Hanoi, Viet Nam

Background: Asia-Pacific has the second-largest HIV epidemic, with 300,000 new HIV cases in 2023, 79% among key populations (KPs) and their partners. The region saw a slower decline in new infections from 2010-2023 (13% versus 39% globally), highlighting the need for improved access to HIV prevention and PrEP. To enhance PrEP access and continuity in Vietnam, USAID/PATH STEPS and Healthy Markets introduced and scaled differentiated delivery models. These efforts included innovative demand generation campaigns, reaching rural, urban, and industrial zone KPs across five provinces to raise awareness and stimulate demand.

Description: Since 2017, the STEPS and Healthy Markets projects, in collaboration and private-sector and community partners, introduced seven differentiated PrEP delivery models. These included „PrEP on Wheels" for industrial workers, PrEP at Commune Health Stations for rural communities, and PrEP as part of integrated HIV, STI, and mental health services at KP-led One-Stop-Shop (OSS) clinics. They also launched TelePrEP for remote consultations. In addition, the projects implemented online and offline HIV education and counseling campaigns to increase HIV testing and PrEP uptake. These included digital outreach through platforms like Facebook and HeeSay (formerly Blued), and workplace campaigns in factories. KP-led clinics provided client-centered care, improving continuation rates.

Lessons learned: Between January 2017 and January 2025, the project enrolled 23,223 new PrEP users (PrEP_NEW), representing nearly 30% of new PrEP clients nationwide, and served 33,182 individuals under PrEP_CURR, accounting for 45% of the national total. Three-month PrEP continuity at OSS and KP-led clinics exceeded 85%. Mobile and digital models improved reach among previously underserved groups. Offering integrated PrEP services at KP-led clinics enabled more convenient service access in a stigma-free environment, facilitating uptake and continuity. Providing remote consultations through TelePrEP also enabled continuity.

Conclusions/Next steps: Differentiated PrEP models adapted to the needs of KPs were critical for increasing uptake of and continuation in PrEP in Vietnam. These models successfully contributed to Vietnam's PrEP scale-up efforts, leading to the adoption of certain models, such as TelePrEP, in national PrEP guidelines.

LB47

Impact of US-funding suspensions on HIV response in the Latin America and Caribbean region

M. Barriga Talero[1], M. Stevenson[2], J. Guillen Cañizares[1], M.A. Torres[3], A. Wirtz[2]

[1]Corporación Red Somos, Bogotá, Colombia, [2]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [3]ICASO, Toronto, Canada

Background: The Latin America & Caribbean region (LAC) has historically had a concentrated and controlled HIV epidemic, leading to a lower prioritization of the region in global HIV response and funding. Only 9 countries had explicit HIV pre-exposure prophylaxis (PrEP) policies as of 2024. Subsequently, the region has observed a recent increase in HIV incidence.

Nonetheless, the majority of national HIV programs rely on donor funding to some extent, and PrEP was only available through foreign-funded programs in several countries.

Methods: We distributed an online survey, from February 18–March 14, 2025, available in English, Spanish, French, and Haitian Creole, to HIV service organizations in the LAC region. 40 organizations from 13 countries provided data for this analysis.

Results: 56% of respondents reported receipt of US funding in the last year; of those, 87% had funds suspended. The median annual affected budget was USD $140,000 (IQR: $87,500-$343,727), representing a median 46% of the organizations' annual budgets (IQR: 25–85), reaching 100% in some cases. The programs most frequently affected by the funding freeze were sexual prevention programs, HIV testing services, psychosocial support, social services, gender-based violence prevention and clinical care, and HIV PrEP (in countries that offered PrEP). Affected programs served a median of 193 adults (IQR: 69–400) and 0 children (IQR: 0–10) living with HIV per organization, totaling 16,179 adults and 1,270 children.

Additionally, they served a median of 2,500 adults (IQR: 150–5,203) and 5 children (IQR: 0–50) without HIV or with unknown HIV status per organization, totaling 117,513

adults and 21,202 children. In total, 156,164 beneficiaries were estimated to lose access to HIV services provided by these organizations alone as a result of the funding freezes.

Conclusions: Suspensions of US foreign aid have led to drastic pauses and terminations of critical HIV prevention and care programs, though our survey likely underestimates the scale of the impact. While the LAC region may have higher autonomy from foreign support and less reliance on US funding than other regions, progress on HIV prevention and control in the region is threatened.

LB48

"You get the injection and it's done": qualitative findings from the first real-world implementation of long-acting cabotegravir for HIV prevention among adolescent girls and young women in Zambia

K. Stoebenau[1], M. Mwale[2], G. Muchanga[2], L. Mwango[2], C. Maambo[2], C. Geaty[3], K. Macdonald[3], C. Baumhart[3], O. Chilyabanyama[2], N. Blanco[3], L.M. Mulenga[4], C.W. Claassen[3], M.-C. Lavoie[3]

[1]University of Maryland College Park, College Park, United States, [2]Ciheb-Zambia, Lusaka, Zambia, [3]University of Maryland School of Medicine, Baltimore, United States, [4]Zambia Ministry of Health, Director of Infectious Diseases, Lusaka, Zambia, Lusaka, Zambia

Background: Adolescent girls and young women (AGYW) in Zambia remain at heightened risk for HIV despite the availability of oral pre-exposure prophylaxis (PrEP). New PrEP formulations such as injectable cabotegravir (CAB-LA) offer a discrete, long-acting alternative for HIV prevention.

We explored the first real-world implementation of CAB-LA among AGYW within a community-based model (Determined, Resilient, Empowered AIDS-Free, Mentored, and Safe [DREAMS] program) in Zambia.

Methods: We conducted qualitative interviews longitudinally (December 2024 and March 2025) with 17 AGYW ages 16-24 recruited from two DREAMS centers. We purposively sampled participants who had initiated CAB-LA within 4 weeks of our first interview. Interview guides, informed by the Andersen Healthcare Utilization Model and the Practical Robust Implementation and Sustainability Model, focused on how participants learned about CAB-LA, their decision to use it, and their early user experience.

Data were transcribed, translated, and brought into Atlas.ti for thematic analysis using deductive and inductive coding.

Results: At the second interview, all participants (100%) had completed their second dose on schedule, consistent with 97% adherence among the 180 AGYW initiated on CAB-LA at the two DREAMS centers. Key themes facilitating CAB-LA uptake and continuation included:

1. Partners can't be trusted – most participants described concerns with partner's infidelity or limited power in sexual decision-making as motivation for PrEP use;
2. Trusted providers counter community misinformation – participants' trust of DREAMS staff and nurses helped overcome myths and misinformation about CAB-LA in the community;
3. Discretion, selective disclosure, and PrEP stigma – PrEP is stigmatized as for ‚prostitutes,' participants appreciated they could be discrete in use with partners and community;
4. Programmatic and social support enables uptake and continuation – friends and fellow beneficiaries of DREAMS with community outreach support uptake and continuation;
5. Freedom – Participants associated CAB-LA with ‚freedom" as they could forget about it. Most reported limited side effects.

Conclusions: This study explored the first implementation of CAB-LA in a real-world setting for AGYW within DREAMS in Zambia. We found that introducing CAB-LA into a trusted HIV prevention program facilitated uptake and adherence to CAB-LA among AGYW, who appreciate that it is long-acting, discreet, and carries few side effects.

LB49

Self-care from anywhere: usability of an AI-Driven HIV testing and care toolkit for AGYW and clinicians in South Africa

S. Bokolo[1], C. Govathson[1], B. Sibiya[1], S. Madlala[1], L. Long[2], S. Frade[3], S. Cooper[4], S. Morris[4], D. Rech[3], S. Pascoe[1], C. Chetty-Makkan[1]

[1]Health Economics and Epidemiology Research Office, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]Boston University, Department of Global Health, Boston, United States, [3]Audere Africa, Johannesburg, South Africa, [4]Audere, Seattle, Washington DC, United States

Background: Stigma, limited provider capacity, and barriers to effective HIV self-testing hinder progress in HIV prevention among adolescent girls and young women (AGYW) in South Africa. To address these gaps, the Self-Care from Anywhere project evaluated the usability of an AI-powered toolkit that includes a WhatsApp-based AI companion and a Clinical Portal. This AI companion engages with AGYWs on HIV prevention, relationships, and sexual health topics, while clinicians monitor the interactions through a Clinical Portal to enhance the accessibility, usability, and delivery of HIV care

Methods: This exploratory study took place in Gauteng Province (November 2024 to February 2025). We enrolled 90 AGYW to engage with the AI Companion; 40 out of the 90 were randomly assigned to complete a simulated HIV self-test and receive AI-delivered counselling. All participants interacted with the AI companion and completed a post-survey, including the System Usability Scale (SUS). Clinical Portal usability testing has occurred with 39 clinicians thus far. The study captured clinical portal users' first impressions without formal training. Using descriptive statistics, we assessed usability, user experience, and service-seeking intentions.

Results: Of the 90 AGYW enrolled, 81.1% had completed high school and 91.1% were unemployed. Most (90%) self-reported an HIV-negative status, with 29% of these

currently on PrEP, and 68% reported sexual activity in the past 12 months. AGYWs rated the AI Companion as having high usability, with a mean SUS score of 88.1 (SD 12.3). Most (92%) felt confident using it, though 13% indicated they may need initial assistance.

Over 90% agreed that seeking HIV treatment was important and self-reported seeking HIV care if needed. Data collection for the Clinical Portal is still underway.

Overall to date, 76% of clinicians reported that using the portal would save time, allowing them to dedicate more time to supporting clients

Conclusions: The AI Companion and Clinical Portal demonstrated high usability and acceptability among adolescent girls and young women (AGYW) and healthcare providers. The Clinical Portal was viewed by clinicians as an effective and time-saving tool for supporting clinical decision-making.

Findings highlight the potential for AI-powered platforms to enhance HIV prevention efforts by improving accessibility, client engagement, and service delivery.

LB50

Optimizing PrEP delivery: preferences of female sex workers in South Africa to enhance uptake and sustainability — a discrete choice experiment

A. Suhr[1], V. Chen[2], N. Dladla[3], C. Singh[3], N. Matenjwa[3], J. Steingo[3], M. Mcingana[3], J.G. Rosen[4,5,6], A. Rao[2], S. Baral[2], H. Hausler[3,7], S. Schwartz[2], K. Rucinski[8]

[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [3]TB HIV Care, Cape Town, South Africa, [4]Brown University Warren Alpert Medical School, Medicine, Providence, United States, [5]Rhode Island Hospital, General Internal Medicine, Providence, United States, [6]Brown University School of Public Health, Epidemiology, Providence, United States, [7]University of Pretoria, Department of Family Medicine, Pretoria, South Africa, [8]Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States

Background: The limited rollout of long-acting injectable pre-exposure prophylaxis (LAI-PrEP) in South Africa represents an opportunity to define preferences among populations at high risk of HIV prior to real-world implementation and scale-up. In response, we evaluated PrEP modality and service delivery preferences among female sex workers (FSW) in South Africa.

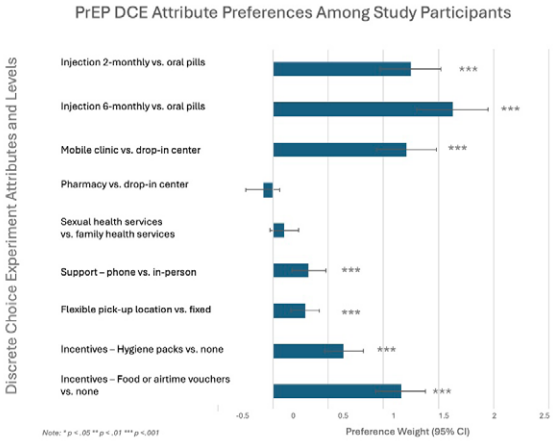
Methods: A discrete choice experiment (DCE) was conducted with 400 FSW accessing community-based HIV prevention services in eThekwini (urban) and Ehlanzeni (rural) Districts between September 2024-March 2025.

We examined preferences across PrEP service delivery features: modality (daily pill, 2-monthly injection, 6-monthly injection); location (mobile clinic, pharmacy, drop-in center); complementary services (sexual health e.g., contraception or family health services e.g., vaccines), case management mode of communication (in-person or phone-based), service versatility (fixed or flexible locations), and incentives (food or airtime vouchers, hygiene packs, none). We used mixed logit models to quantify population-level preferences and assess preference heterogeneity.

Results: FSW (median age: 26, IQR [23,32]) exhibited the strongest preference for receiving 6-month injections (β=1.63; p<0.001), with high heterogeneity (SD=2.08, p<0.001), but strongly preferred 2-month injection over oral PrEP (β=1.24; p<0.001), and mobile-clinics as the preferred way to access PrEP over drop-in centers (β=1.21; p<0.001).

FSW indicated significant preferences for phone-based support (β=0.32, p<0.001), flexible service locations (β=0.29, p<0.001), and receiving incentives of vouchers (β=1.16, p<0.001) and hygiene packs (β=0.64, p<0.001).

FSW preferences varied by location: while study participants in eThekwini (urban) strongly preferred 6-monthly injections (β=1.53, p<0.001), those in Ehlanzeni (rural) showed an even stronger preference (β=2.21, p<0.001).



Conclusions: FSW exhibited strong preferences for LAI-PrEP, mobile service delivery, and vouchers, highlighting opportunities to tailor PrEP service delivery to support uptake and sustained use of biomedical HIV prevention commodities.

Optimizing the impact of LAI-PrEP will require delivery strategies that are attuned to FSW preferences, including the decentralization of injectable PrEP options through mobile-based delivery.

LB51

Health system reliance and disruption: lessons from Mozambique's experience with the U.S. aid freeze

Y. Paulo[1], O. Tiberi[1], P. Ramgi[2], R. Muleia[3], I. Gaspar[1], D. Moiana Uetela[4]
[1]MoH Mozambique, National Directorate of Public Health, Maputo, Mozambique, [2]Instituto Nacional de Saúde, Health and Wellbeing Research Division, Marracuene, Mozambique, [3]Instituto Nacional de Saúde, Division of surveys and health observation, Marracuene, Mozambique, [4]Instituto Nacional de Saúde, Research program on diseases with major health impact, Marracuene, Mozambique

Background: In January 2025, an executive order was issued suspending almost all the U.S. foreign aid programmes for 90 days. We aimed to describe the context, the immediate response and the short-term impact of this order on Mozambique's HIV service provision.

Description: Mozambique, the country with the third highest population of people living with HIV in the world, relies heavily on the U.S. fund which, in 2022, covered 93% of the country's expenses for HIV service delivery, mainly through PEPFAR. Due to this reliance, the country's Ministry of Health has entrusted critical logistic and operational activities for the continuity of HIV service delivery to implementing partners funded by PEPFAR.

Therefore, the "stop-work order", with no prior notice and unclear guidance for PEPFAR programs and personnel, made it difficult for the Ministry of Health to continue managing the required logistic and operational activities for the continuity of service delivery. This disrupted the service provision chain, including the inability to deliver prevention and treatment services and commodities to its clients.

Lessons learned: National level programmatic data showed marked declines in key HIV service indicators in February 2025 for male and female clients from all age groups, compared to the same month of the previous year. In general, there was a decline in peer-led outreach interventions enrolees from 13,834 in February 2024 to 9,910 in February 2025 (40% reduction), in antiretroviral therapy initiations from 25,379 to 19,002 (34%) and re-initiations from 15,259 to 10,033 (52%), and in tuberculosis screening coverage from 555,251 to 478,247 (16%).

Among those on treatment, there was a decrease of 37,010 (38%) of viral load tests performed, 27,656 (37%) of test results received, and 22,043 (33%) of viral suppression. These viral load cascade indicators were worse in children (<15years), 44%, 71% and 43%, respectively, showing a disproportionate impact on paediatric population.

Conclusions/Next steps: The findings highlighted the critical role of U.S. funding in sustaining the HIV prevention and treatment services in Mozambique and exposed the country's system fragility.

This episode underscores the urgency of building health systems that are both financially and operationally sustainable in the face of unpredictable donor landscapes.

Late-breaker e-posters

EPLB001

Improving viral suppression among children living with HIV during year 2023 through age-appropriate doses of anti-retroviral therapy (ART): An experience from Mumbai, India

V.K. Karanjkar[1], S. Dhande[2], S. Koli[2], P. Deshpande[2], A. Saxena[2], V. Jondhale[2], S. Bhagat[2], S. Todmal[2], K. Yewale[2], A. Hegde[2], U. Sharma[3], S. Upadhyaya[3], S. Chawla[3]
[1]Mumbai Districts AIDS Control Society, Mumbai, India, [2]PATH, New Delhi, India, [3]Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, New Delhi, India

Background: In Mumbai, a metropolitan city in India, during June 2022, overall viral load (VL) suppression among People living with HIV (PLHIV) was 98% as per quarterly report, however it was 92% in children (<15 years) living with HIV **(**CLHIV). Low suppression rate may be attributed to non-escalation of the drug dosages as per age and weight bands in addition to other factors such as poor adherence, high pill burden and poor palatability in children.
The U.S. President's Emergency Plan for AIDS Relief (PEPFAR)-supported project Sashakt provided technical assistance to Mumbai District AIDS Control Society (MDACS) to administer age-appropriate doses for CLHIV to improve retention and viral suppression.
Description: In February 2023, 1,420 CLHIV records were reviewed for the current age, weight, anti-retroviral therapy (ART) doses and VL. ART Dosages were compared to recommended standardized weight-band guidelines, and 20% (282/1420) cases of sub-optimum dosages were identified. The team supported the drug dose adjustment as per current weight and clinical monitoring of these CLHIV for subsequent six months. The baseline VL data was analyzed to correlate viral suppression with dosage accuracy. The VL suppression among CLHIV with correct dosage was 93% (970/1042), while it was 87% among those with sub-optimum doses (chi square p<0.001).
The subsequent VL testing was done in October 2023 after dose adjustment as per current weight for all children with sub-optimum doses. The viral suppression rate increased from 87% to 91% in October 2023 (chi square p<0.001) in this group of CLHIV.
Lessons learned: Significant numbers of CLHIV were receiving sub-optimal dosages of ART that may resulted in lowered viral suppression. Regular monitoring of age, weight, and ART doses may have helped to improve the viral load suppression among CLHIV.
Conclusions/Next steps: To sustain and enhance treatment efficacy, regular monitoring and timely corrective actions for ensuring age-appropriate ART doses may be considered to facilitate appropriate ART dosage and viral suppression among CLHIV.

EPLB002

Improving treatment continuity and viral suppression during the year 2023 among people living with HIV (PLHIV) re-engaged in care in Mumbai, India

S. Ughade[1], V.K. Karanjkar[1], S. Wani[2], P. Deshpande[2], N. Tadkod[2], A. Shaikh[2], S. Koli[2], S. Todmal[2], S. Bhagat[2], P. Jha[2], A. Phalake[2], T. Mulik[2], A. Hegde[2], S. Chawla[3], U. Sharma[3], S. Upadhyaya[3], P. Nadol[3]
[1]Mumbai Districts AIDS Control Society, Mumbai, India, [2]PATH, New Delhi, India, [3]Division of Global HIV & TB, U.S. Centers for Disease Control and Prevention, New Delhi, India

Background: Interruptions in treatment (IIT) challenge HIV care, elevating morbidity and mortality among people living with HIV (PLHIV). Program data (2021-2022) from Mumbai revealed that 35% of PLHIV who returned to care after treatment interruption (re-engaged in care) were documented to have another IIT in the subsequent quarter. Viral load (VL) uptake and suppression were also sub-optimal among re-engaged PLHIV (62% and 85%, respectively).
Recognizing the need for tailored care among re-engaged PLHIV, the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) supported Project Sashakt provided technical assistance to enhance treatment continuity and VL suppression by providing person centric services.
Description: From February 2023, the project provided technical support to all 20 Antiretroviral Treatment Centers (ARTCs) in Mumbai for person-centric management and follow-up of PLHIV re-engaged in care. The client records like address and phone numbers were updated, accompanied referrals provided for clinical consultation and psychosocial support as needed.
The reason-based person centric plans-decentralized pill pick up from community or sub district facility-based centers, flexi pill pick-up timing, tele consultations and person centric counselling were co-created by counsellors in consultation with PLHIV to reduce IIT
Lessons learned: Between February 2023 and December 2023, 1,871 PLHIV (32% female; 83% [1,551/1,871] above 30 years of age) were re-engaged in care at the 20 ARTCs. Among these six-month retention rate as of June 2024 was 80% (1,490/1,871), higher than 69% observed among re-engaged PLHIV in Mumbai during 2021-2022 (p<0.001). Of 1031 who re-engaged and had VL testing, the viral suppression rate (VL <1000 copies/ml) increased to 89% (918/1,031) from 85% in 2021-2022 (chi square p<0.006).
These findings highlight the potential effectiveness of proactive and close follow-up and person-centric services in reducing IIT and enhancing VL suppression among PLHIV re-engaged in care.
Conclusions/Next steps: Applying an individualized case management model of care among re-engaged PLHIV may contribute to improved treatment continuity and VL suppression.

EPLB003

Effect of Digital Adherence Tools (DAT) on adherence to antiretroviral treatment and viral load suppression among children living with HIV in Tanzania.

I. Swai[1,2], T. Msosa[2,3], K. Ngowi[1], R. Maro[1], T.F. Rinke de Wit[4], R. Aarnoutse[5], M. Sumari-de Boer[1,4,6]
[1]Kilimanjaro Clinical Reseach Institute (KCRI), mHealth, Moshi, Tanzania, the United Republic of, [2]Amsterdam University Medical Centre (UMC), Public Health, Amsterdamt, Netherlands, the, [3]Helse Nord Tuberculosis Initiative, Kamuzu University of Health Sciences, Blantyre, Malawi, [4]Amsterdam Institute for Global Health and Development,, Amsterdam, Netherlands, the, [5]Radboud University Medical Centre, Department of Pharmacy, Research Institute for Medical Innovation,, Nijmegen, Netherlands, the, [6]Institute of Public Health, Kilimanjaro Christian Medical University College, Moshi, Tanzania, Moshi, Tanzania, the United Republic of

Background: Interventions that assist with antiretroviral treatment (ART) adherence are highly needed to help children living with HIV (CLHIV) achieve viral suppression and avoid HIV drug resistance. We investigated the effect of a Digital Adherence Tool (DAT) on improving adherence to ART among CLHIV in Tanzania.
Methods: We conducted a pragmatic trial in which CLHIV were randomized to either the intervention (DAT) or control arm. Children in the intervention arm received daily reminder SMS, used the Wisepill device that monitored their medication intakes by recording each opening as intake, and received adherence feedback based on the device-generated report. We followed them for twelve months, in an interval of 2-3 months' visits.
We collected self-reported and pharmacy refill adherence at each visit and viral load at baseline and study completion. We categorized viral suppression as viral load above or below 50 copies/mL. We performed a chi-square test to compare the proportion of CLHIV achieving 95% adherence and viral suppression between the two arms.
To estimate the adjusted risk ratio of viral suppression and to account for repeated adherence measurements within individuals over time, we conducted a quasi-Poisson model with robust standard errors analysis.
Results: We randomized 154 children: 78 in the intervention and 76 in the control arm. The proportion achieving 95% adherence was 62(84%) vs 64(90%) (P-value = 0.26) based on self-reported adherence and 54(70%) vs 50(68%) (P-value= 0.73) by pharmacy refill methods. Sixty-three (86%) children in the intervention achieved viral suppression, compared to 51(73%) in the control arm: RR of 1.18 (95% CI: 1 - 1.40, p = 0.046).
The adjusted analysis showed no significant difference in adherence between the arms. However, children with suppressed baseline viral loads had 2.36 times higher chance of being suppressed at the endline than those unsuppressed at baseline (IRR=2.36; 95% CI: 1.73-3.31).
Conclusions: This trial showed a weak effect of DAT in improving viral suppression (secondary objective) but didn't show an effect on adherence (primary outcome). This could be due to a nondifferential misclassification error in measuring adherence in both arms. We recommend a trial powered on viral load to measure viral suppression as the main outcome.

EPLB004

A cluster randomized trial of visitect CD4 advanced disease platform among outpatients with advanced HIV disease in Uganda

E. Kalema Nalintya[1], S. Najjuka[1], A. Fieberg[2], P. Nerima[1], E. Schwartz[3], R. Ajilong[1], T. Adzemovic[4], T. Kiiza[1], P. Sekar[3], A. Lehman[3], B. Dai[2], D. Meya[1], D. Boulware[3], R. Rajasingham[3]
[1]Infectious Diseases Institute,Makerere University college of Health sciences, Research, Kampala, Uganda, [2]University of Minnesota, Biostatistics, Minneapolis, United States, [3]University of Minnesota, Infectious Diseases, Minneapolis, United States, [4]University of Minnesota, Paediatrics, Minneapolis, United States

Background: Despite significant progress in HIV care globally, a persistent 30 to 40% of people present with advanced HIV disease (CD4 cell count ≤200 cells/μL). Visitect CD4 Advanced Disease platform is a point-of-care CD4 test that is being implemented in resource-limited settings. We sought to assess clinical outcomes of survival and retention-in-care among people with advanced HIV disease who received Visitect CD4 testing compared with standard CD4 testing.
Methods: We performed a 2x2 factorial cluster randomized clinical trial among people with advanced HIV disease to evaluate the Visitect CD4 Advanced Disease platform compared with onsite standard laboratory-based CD4 testing. The trial was conducted at 16 outpatient HIV clinics. We sought to assess survival and retention-in-care among people with advanced HIV disease who received Visitect CD4 testing compared with standard CD4 testing. Randomization by CD4 methodology was stopped on June 18, 2024 and the results of the CD4 factorial are presented here.

	Visitect CD4 platform	Standard-of-care CD4 testing	P-value
Enrolled	927	797	
Confirmatory CD4 ≤200 cells/mcL	588	797	
Follow up completed	553	763	
Death or Lost to follow-up[1]	40 (7.2%)	56 (7.3%)	0.94
Death	22	30	
Lost to follow-up	18	26	
Hazard ratio (95% CI)[2] Comparing Visitect to Standard-of-care	0.99 (0.66, 1.49)		0.96

[1]Chi-squared test, without adjusting for clustering
[2]Cox mixed-effects model to account for clustering

Table 1. Summary of primary events by CD4 groups.

Results: Between May 5, 2022 and February 18, 2025, 1724 participants were enrolled, of whom 927 participants were assigned to Visitect CD4 testing (8 clusters) and 797 were assigned to standard CD4 testing (8 clusters). The median age was 34 years, 52% were female and 56% were ART-naive at enrollment. The median CD4 cell count was 110 cells/

µL. The median time to receipt of CD4 results was zero days in both arms. Among participants with confirmatory CD4 ≤200 cells/mcL, death or loss to follow-up occurred in 40 (7.2%) participants assigned to Visitect CD4 testing, and 56 (7.3%) participants assigned to standard CD4 testing (Hazard ratio, 0.99; 95%CI, 0.66 to 1.49, Table 1).
Conclusions: Implementation of the Visitect CD4 Advanced Disease platform demonstrated equivalent, but no additional, benefit to 24-week survival and retention-in-care compared with other point-of-care CD4 strategies.

EPLB005

Indirect treatment comparison of the efficacy of cabotegravir and lenacapavir for HIV pre-exposure prophylaxis (PrEP) versus no PrEP

N. Hawkins[1], J. Thompson[1], R. Grove[2], M. Sieverding[3], P. Budnik[4], J. Scherzer[5], N. Danchenko[6], S.-J. Anderson[2], L. Dupont-Benjamin[6]
[1]Visible Analytics, Oxford, United Kingdom, [2]GSK, London, United Kingdom, [3]Veramed, Frankfurt, Germany, [4]ViiV Healthcare, London, United Kingdom, [5]ViiV Healthcare, Munich, Germany, [6]ViiV Healthcare, Rueil-Malmaison, France

Background: Cabotegravir (CAB) is the first long-acting injectable (LAI) approved for pre-exposure prophylaxis (PrEP) to reduce the risk of sexually acquired HIV, based on the HPTN 083 and 084 trials. Recently, the PURPOSE 1 and 2 trials demonstrated that lenacapavir (LEN), an investigational LAI PrEP option, is efficacious across diverse populations. In the absence of a head-to-head trial, an indirect treatment comparison (ITC) was conducted to assess efficacy of CAB and LEN to provide insight into their relative clinical value.
Methods: A systematic literature review was conducted to identify all relevant trials for this comparison. Efficacy inputs for this ITC were from published efficacy data from the PURPOSE trials (Bekker et al. *NEJM*. 2024;391:1179-1192; Kelley et al. *NEJM*. 2025;392:1261-1276) and derived from published HPTN trial data. CAB and LEN were compared using No PrEP as a common comparator, sourced from the background HIV incidence arm of the PURPOSE trials and the No PrEP arm leveraging previous ITC methodology comparing CAB with No PrEP (Hawkins et al. ISPOR 2024; Atlanta, GA. Poster CO156).
Results: The predicted efficacy of CAB vs No PrEP in reducing HIV acquisition risk was high across men who have sex with men (MSM) and transgender women (TGW; 96% [95% CI: 89.78-98.37]) and cisgender women (CGW; 98% [88.95-99.79]), which was comparable to that observed in the PURPOSE trials (men/gender-diverse people, 96% [82.05-99.00]; CGW, 100% [95.91-100.00]). The hazard ratio of LEN compared with CAB was estimated to be 1.04 (0.19-5.69) in MSM and TGW and 0.00 (0.00-3.21) in CGW.
Conclusions: CAB and LEN both offer high and similar efficacy in reducing HIV acquisition risk compared with No PrEP and this was generally consistent when using oral PrEP as a common comparator with adjustment for differences in adherence (data not shown here). Additional factors associated with these regimens, including the potential for drug-drug interactions and adverse events (eg, injection site reactions), real-world usage, seroconversion resistance, and patient preference, will be important to comprehensively assess clinical value and assist with decision-making.

EPLB006

A latent class analyses of PrEP-related awareness, knowledge, appointment, and prescription among black residents in HIV high impact zip codes in Miami, FL

S. Dale[1], V. Petrulla[1], D. Feaster[2], L. Smith[3], I. Wright[4]
[1]University of Miami, Psychology, Miami, United States, [2]University of Miami, Public Health Sciences, Miami, United States, [3]University of California San Diego, Medicine, San Diego, United States, [4]University of Miami, Economics, Miami, United States

Background: Black communities in southern states of the U.S. continue to be disproportionately impacted by HIV compared to other racial/ethnic groups. However, there is diversity within Black communities in terms of demographics, socio-structural experiences, and barriers to care. Latent class analysis is an advanced statistical approach to tease apart what subgroups may benefit from greater efforts in HIV prevention.
Methods: Via a large-scale implementation project focused on PrEP in HIV high impact zip codes in Miami, Florida data was recently collected (e.g., discrimination, medical mistrust, displacement, barriers to care, and PrEP) among 2654 Black residents. Participants were asked about PrEP awareness, knowledge, and PrEP-related care (e.g., referral, speaking to a provider, receiving a prescription). A latent class analysis was conducted in MPlus to determine the best number of classes. PrEP variables were then included in the model as outcome variables.
Results: Six classes were the best fit for the model (AIC = 116266.9, BIC = 118055.6, SSBIC = 117089.7). The classes differentiated based on gender, education, employment, disability status, displacement, trauma, discrimination, substance use, and barriers to care. There was an overall difference across the classes in hearing of PrEP, speaking to a provider about PrEP, PrEP referral, scheduling a PrEP appointment, being prescribed PrEP, and taking PrEP. Class 3 (of Haitian creole-speaking participants, non-US-born, low adversities) had the lowest ratio of participants who had heard of PrEP (significant difference from all other classes $p < .001$).
Interestingly, Class 5 (U.S.-born, high discrimination, high medical mistrust, highest substance use, trauma, highest displacement, highest barriers to care) had the highest ratio of speaking to a provider and PrEP referral, appointment, and prescription and showed significant differences compared to other classes. For instance, participants in Class 5 were taking PrEP at a higher rate than those in Classes 2 (U.S.-born, low on adversities) and 3.
Conclusions: Our findings echo that (a) non-English speaking and foreign-born Black individuals may require strategic efforts to improve PrEP awareness/uptake and

(b) further research is needed to understand the mechanisms by which U.S.-born individuals facing high adversities are learning about and accessing PrEP.

EPLB008

Prevalence and patterns of HIV drug resistance among adults initiating dolutegravir-based first-line ART in Cambodia: A cross-sectional survey

P. Pheng[1], S. Samreth[2], B. Ngauv[2], C. Mom[2], S. Pich[2], O. Ouwe Missi Oukem-Boyer[3], B. Guillard[4], J.-L. El Kaim[3], E. Nerrienet[5], V. Saphonn[1], E. Mosnier[1], V. Ouk[2]
[1]University of Health Sciences, Phnom Penh, Cambodia, [2]National Center for HIV/AIDS, Dermatology and STD (NCHADS), Phnom Penh, Cambodia, [3]Exertise France-l'Initiative, Paris, France, [4]Pasteur Institute of Cambodia, Phnom Penh, Cambodia, [5]Fondation Mérieux, Lion, France

Background: Cambodia adopted dolutegravir (DTG)-based antiretroviral therapy (ART) as the preferred first-line regimen in 2019, aligning with WHO recommendations to address the growing threat of HIV drug resistance. However, national data on resistance to DTG remain unavailable, underscoring the need for surveillance. This study aimed to determine the prevalence and patterns of pretreatment HIV drug resistance (PDR) among adults initiating DTG-based ART in Cambodia in 2024.
Methods: :A nationally representative cross-sectional survey enrolled 312 ART-naïve adults from 28 clinics across 17 provinces in Cambodia between March and August 2024, using probability proportional to size sampling. Pretreatment HIV drug resistance was assessed before ART initiation.
Results: Among participants, 78.53% identified as male at birth and 5.13% as trans women, with a median age of 30 years (IQR: 25-38). Sexual contact was the primary transmission mode, with 67.95% involving partners of unknown HIV status. PDR tests completed for 96.81% of samples. Overall PDR prevalence was 19.51%, with resistance to nucleoside reverse transcriptase inhibitors (10.18%), non-nucleoside reverse transcriptase inhibitors (3.5%), and protease inhibitors (9.92%).
Notably, no DTG-associated resistance mutations were observed. NRTI resistance mutations (Q151M, T69N/S, T215TS, Y115F) occurred infrequently. NNRTI resistance showed E138A mutation dominance (33.3%), followed by K103N/V106I/V179I (19.1%). PI resistance mutations were highly prevalent, with six mutations appearing in over half the samples—H69K (97%), M36I (92.9%), G16I (88.1%), L89M (78.6%), L10V (66.7%), and K20R (54.8%).
Conclusions: The absence of DTG resistance supports the continued use of DTG-based regimens as first-line therapy. However, significant resistance to other drug classes highlights the necessity for routine genotypic testing prior to ART initiation and ongoing nationwide surveillance. Enhanced prevention strategies, particularly targeting sexual transmission from partners of unknown HIV status, and expanded access to resistance testing are critical for sustaining ART efficacy and optimizing Cambodia's HIV treatment guidelines amidst evolving resistance patterns.

EPLB009

HIV incidence and risk factors among MSM using PrEP in a real-world HIV-PrEP program in Hanoi, Vietnam

H.T.M. Bui[1], H.T. Dang[1], L.Q. Pham[2], T.C. Nguyen[3], H.V. Tran[3], T.N. Hoang[4], H.T. Nguyen[4], N.B. Lung[1], G.M. Le[2]
[1]Hanoi Medical University, Center for Training and Research on Substance Abuse - HIV (CREATA-H), Hanoi, Viet Nam, [2]Hanoi Medical University, Department of Epidemiology, School of Preventive Medicine and Public Health & Center for Training and Research on Substance Abuse - HIV, Hanoi, Viet Nam, [3]Wecare Social Enterprise, Hanoi, Viet Nam, [4]Centers for Diseases Control and Prevention, Vietnam., Division of Global HIV and Tuberculosis, Global Health Center., Hanoi, Viet Nam

Background: In 2019, Vietnam expanded its national pre-exposure prophylaxis (PrEP) program geographically to address increasing HIV transmission among men who have sex with men (MSM). To evaluate program outcomes and identify gaps, we estimated HIV incidence and risk factors among MSM using PrEP at the Sexual Health Promotion (SHP) clinic – the largest PrEP provider in Hanoi.
Methods: We analyzed clinical data from clients who initiated PrEP at SHP from May 2019 to December 2024. Eligible clients were males reporting sex with men and had at least one HIV test after PrEP initiation. Self-reported adherence, syphilis screening at any time point, and regimen-switching between daily and event-driven (ED) PrEP were recorded. Discontinuation was defined as missing a scheduled visit by at least 30 days. Incident HIV cases were defined as seroconversions following a prior non-reactive test. HIV incidence was estimated using the person-time method, with follow-up from PrEP initiation to the last clinic visits or, for those who seroconverted, the first HIV-reactive result. Risk factors were assessed using Cox proportional hazards regression.
Results: A total of 4,343 eligible clients (median age: 24 years; IQR:21–28), contributed 6497.7 person-years (PYs) of follow up. Overall, 1,416 (32.6%) switched regimens: 738 from daily to ED, 146 from ED to daily; and 532 bidirectionally; 3441 (79.2%) reported good adherence; and 3,396 (78.2%) had at least one syphilis screening. Seventy clients seroconverted, yielding an HIV incidence rate of 1.08/100PY (95% CI:0.85–1.36). Higher HIV risk was associated with age < 25 years (adjusted hazard ratio [aHR] 2.63; 95%CI:1.57–4.42); being PrEP-naïve (i.e., having never used PrEP previously) (aHR=2.68; 95% CI:1.49–4.80); remaining on a single daily PrEP regimen (aHR=3.26; 95% CI:1.69–6.28); having ≥2 PrEP discontinuations (aHR=2.35; 95% CI:1.26–4.38); and no syphilis screening (aHR=3.33; 95% CI:1.98-5.59).
Conclusions: This study highlights the HIV incidence and associated risk factors among MSM using PrEP in Hanoi. Individuals who were younger and PrEP-naïve, remained on a single regimen, interrupted PrEP at any point, and had no syphilis screening were at higher HIV risk. Targeted interventions for young, naïve PrEP users could improve PrEP retention and syphilis screening, further reducing HIV incidence among MSM.

EPLB011

Prevalence of HIV and the care and treatment cascade among pwids in 5 cities of Mozambique (Maputo, Beira, Tete, Quelimane, and Nampula)

A. Mutola Jemuce[1], S. Nuvunga[1], R. Muleia[1], A. Banze[1], C. Botao[1]

[1]Instituto Nacional de Saude, Divisao de Observacao e Inqueritos em Saude, Maputo, Mozambique

Background: Mozambique is one of the countries with the highest HIV rates in the world. At a global level, People Who Inject Drugs (PWID) have up to 33 times greater chance of becoming infected with HIV, when compared to the general population, and in the Mozambican context, the prevalence among them is more than double when compared to the general population. Despite this reality, little has been published about the risk factors behind these numbers. This study presents results on the weight of HIV and the way care is provided among PWID in the country.

Methods: This survey was carried out using the referral chain sampling (RDS) methodology. Pre-implementation formative assessment was carried out. Recruitment took place from June 2023 to February 2024. Data was collected through a structured questionnaire and rapid testing for HIV, Hepatitis B and C. The cascade of care and treatments for PLHIV was also calculated. All analyzes were weighted to accommodate the design.

Maputo	Beira	Tete	Quelimane	Nampula
• Invitations distributed: **1496** • Returnees: **533** • illegible: **522**	• Invitations distributed: **1485** • Returnees: **545** • illegible: **522**	• Invitations distributed: **1486** • Returnees: **532** • illegible: **524**	• Invitations distributed: **1494** • Returnees: **590** • illegible: **534**	• Invitations distributed: **1489** • Returnees: **553** • illegible: **532**

Figure. Recruitment flow (June 2023 to February 2024).

Results: The prevalence of HIV among PWIDs was estimated at 29.9% in the city of Maputo, 18.0% in Beira, 13.8% in the city of Tete, 20.8% in Quelimane and 13.3% in Nampula. The cascade results are as follows:

Figure. Care and treatment cascade 95-95-95.

Conclusions: HIV infection rates in PWID are worrying. Evidence shows that there is a long way to reach global goals and to achieve them it is necessary, among others, to encourage community awareness programs to reduce discrimination against PWID and Strengthen ART adherence programs, increasing access and coverage of services for STIs, ensuring that PWID receive adequate treatment.

EPLB012

The impact of the USG funding freeze on PrEP implementation and continuity in Nigeria

N. Otubu[1], O. Sowale[1], O. Olumilua[1], I. George[1], U. Amalu[1], D. Falayajo[1], C. Fashanu[1], O. Fasawe[1], A. Mwamelo[2], D. Resar[2]

[1]Clinton Health Access Initiative, Abuja, Nigeria, [2]Clinton Health Access Initiative, HIV Prevention, Boston, United States

Background: Nigeria is at a pivotal juncture in HIV prevention, advancing the roll-out of long-acting injectable cabotegravir (CAB-LA) pre-exposure prophylaxis (PrEP) while expanding oral PrEP nationwide—largely with U.S. Government (USG) support. However, the USG funding freeze in January 2025 disrupted these efforts, impacting PrEP programs and recipients of services. This analysis evaluates the funding freeze's impact on CAB-LA roll-out, oral PrEP service provision, and national PrEP data reporting infrastructure.

Methods: To understand the impact, we gathered data through stakeholder consultations between January and March 2025, including government officials, representatives of implementing partners, and leaders from key population (KP) groups. We combined these perspectives with programmatic data from January 2024 to March 2025, focusing on client initiation, retention, and site functionality across USG-supported states, to capture the numbers and human stories behind the disruption.

Results: The CAB-LA pilot across the 15 PEPFAR-supported sites faces challenges, with only 7% (160) of the target population initiated before the stop work order, and just 33% (53) of initiators receiving a second dose. Between Q1 2024 and Q1 2025, new oral PrEP initiations among KPs declined by 51% from 41,111 to 20,039 while the total number of clients receiving PrEP dropped from 55,389 to 34,187. The national reporting rate for PrEP indicators on DHIS2.0 plummeted from 95% to 18% due to data flow interruptions. KP-led and community-based models were notably affected. Approximately 95% of previously active KP-focused PrEP sites reported full (86%) or partial (14%) service suspension due to commodity unavailability/inaccessibility or disrupted distribution, human resource, and funding gaps. Qualitative findings show loss of trust among KPs—impeding prior demand generation efforts for PrEP delivery, increased stigma, and elevated HIV risk perception due to inconsistent and disrupted access.

Conclusions: The USG funding freeze disrupted PrEP delivery in Nigeria, setting back progress in HIV prevention and highlighting the fragility of donor-dependent health programs. While the Ministry has proposed an integrated government-led approach in response, mitigating the impact requires coordinated emergency gap-filling to re-establish the program momentum, decentralized procurement pathways, resilient service delivery approaches and data systems.

EPLB013

Improving HIV service delivery for orphans and vulnerable children in Zambia: lessons from a CQI intervention under the ECAP III program

E. Njeuhmeli[1], C. Kambikambi[1], L. Nkhoma[2], E. Ngulube[1], M. Nur[1], C. Fokou[1], V. Kapotwe[1], W. Kanjipite[2], J. Phiri[2], E. Lliddell[1], U. RalphOpara[1], C. Bolton[2], S. Neri[1]
[1]Project HOPE The-People-To-People Health Foundation, Washington, DC, United States, [2]Center for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia

Background: Zambia's HIV epidemic continues to disproportionately affect children and adolescents, particularly orphans and vulnerable children (OVC), who face significant barriers to disclosure, adherence, and retention in care. The USAID-funded Empowered Children and Adolescents Program III (ECAP III), implemented in Lusaka Province, aims to improve the wellbeing of OVC through comprehensive, family-centered services. Midway through implementation, persistent gaps in case management, supervision, and safeguarding led to the adoption of a Continuous Quality Improvement (CQI) approach to enhance service delivery quality and accountability.
Description: From November 2023 to January 2025, Project HOPE and CIDRZ implemented a CQI framework across four districts—Chilanga, Chongwe, Kafue, and Lusaka—reaching over 77,000 OVC through 214 trained community case workers. The intervention focused on six thematic areas including HIV case management, safeguarding, and infrastructure. District CQI teams were trained on supervision, mentorship, and use of a digitized CQI tool within the DHIS2 platform. Data were collected via mobile applications during joint district-level assessments involving case workers, M&E officers, and government social service representatives.
Lessons learned: CQI implementation led to measurable improvements across all four districts. Chilanga saw case management scores rise from 24% to 67% and M&E from 43% to 63%. Chongwe, despite initial resistance, improved safeguarding from 13% to 60% and staffing from 20% to 53%. Success was greatest in districts with strong leadership engagement and integrated CQI into existing governance structures.
Key lessons include the value of introducing CQI at program inception, the necessity of structured change management to mitigate resistance, and the use of digital tools for real-time data use and accountability.
Conclusions/Next steps: These endline findings, concluded in February 2025, provide timely evidence for scaling CQI within national HIV and child protection programs. CQI should be embedded from the outset of program implementation to build systems for continuous learning, strengthen adherence and viral suppression outcomes among children and adolescents, and promote sustainable, district-led service delivery improvements.

EPLB014

Preferred short course tuberculosis preventive regimens for adults and adolescents living with HIV

P.A. Bock[1], E. Vovc[2], N.P. Ford[2,3], H.S. Cox[4,5]
[1]Desmon Tutu TB Centre, Stellenbosch University, Paediatrics and Child Health, Cape Town, South Africa, [2]World Health Organization, Department of Human Immunodeficiency Virus, Hepatitis, and Sexually Transmitted Infections, Geneva, Switzerland, [3]University of Cape Town, Public Health, Cape Town, South Africa, [4]University of Cape Town, Medical Microbiology, Cape Town, South Africa, [5]Burnet Institute, TB, Melbourne, Australia

Background: Tuberculosis (TB) is the leading cause of death among people living with HIV (PLHIV). While TB Preventive Therapy (TPT) is recommended, the preferred regimen for PLHIV remains unclear. We conducted a systematic review comparing TPT completion, grade 3&4 adverse events (AEs), TB incidence and HIV viral load suppression (VLS) among HIV-positive adults and adolescents (≥13 years) receiving daily isoniazid- rifapentine for one month (1HP), weekly isoniazid- rifapentine for 3 months (3HP) and 6 months daily isoniazid (6H).
Methods: We searched Pubmed, Embase and the Cochrane register, January 2014 to November 2024, and relevant conference abstracts (2022-2024); randomized control trials (RCTs) and prospective observational studies were included. For TPT completion, toxicity and VLS, single-armed estimates were compared, and meta-analyses were conducted (random-effects models). For TB incidence analysis was limited to comparative studies as data were insufficient for meta-analysis. Evidence certainty was assessed using GRADE.
Results: We screened 2788 studies; 20 studies (13 RCTs) were included. Overall TPT completion (n=12731) was 80%; highest with 1HP (97%, 95% CI 96-98%) and 3HP (92%, 90-94%), versus 6H (72%, 62-82%). Grade 3&4 AEs (n=6906) were highest with 6H (15%), versus 1HP (7%) and 3H (5%), but differences were not significant. Grade 3&4 hepatoxicity was lowest with 3HP (0.4%).
Across 3 RCTs testing either 1HP or 3HP, TB incidence was similar by regimen. VLS (n=830) was similar with 1HP and 3HP combined (93%) versus 6H (92%, one study).
Among 15300 participants, 105 deaths occurred, 3 attributed to 6H, none to 1HP or 3HP. Certainty of evidence was very low (TPT completion) and low (AEs, incidence and VLS).
Conclusions: Rifapentine-containing TPT regimens for PLHIV should continue to be scaled up. As 3HP is associated with high completion and low AEs, it is well-suited for broad implementation across LMIC settings.
While 1HP remains promising, there is an overall need for more high-quality data on relative risks and benefits across different TPT regimens.

EPLB015

Impacts of accompaniment on self-managed abortion among abortion seekers in Cameroon

P.N. Temate Fongeh[1]

[1]Vision in action cameroon, Community Health, Buea, South-West, Cameroon

Background: Unsafe abortion remains a major contributor to maternal morbidity and mortality globally, particularly in sub-Saharan Africa, where restrictive laws and stigma continue to limit access to safe abortion services. In Cameroon, where abortion is largely restricted, self-managed abortion (SMA) has become increasingly common. However, there is limited evidence on the role of accompaniment in improving the safety and experience of SMA seekers.

This study aimed to explore the psychological, physical, social, and empowerment-related impacts of accompaniment during the SMA process, drawing on the experiences of abortion seekers, service providers, and sex workers.

Methods: This qualitative study used a phenomenological approach to capture lived experiences. In-depth interviews were conducted with 12 abortion seekers and 8 abortion service providers across different regions in Cameroon. Additionally, one focus group discussion (FGD) was held with sex workers to gather community-based perspectives. Participants were selected through purposive sampling, and data were collected using semi-structured guides. Thematic analysis was applied using both deductive and inductive coding, aligned with four research questions focused on psychological, physical, social, and empowerment impacts.

Results: Findings revealed that accompaniment significantly reduced emotional distress and improved psychological well-being among abortion seekers by offering emotional reassurance, accurate information, and empathetic support. Physically, accompaniment helped mitigate complications through symptom monitoring and timely referrals. Socially, accompaniment reduced feelings of isolation and enhanced interpersonal trust, though stigma remained pervasive. In terms of empowerment, accompaniment enabled informed decision-making, autonomy, and confidence in managing the abortion process. However, some service providers also reported emotional fatigue and resource challenges due to limited institutional support.

Conclusions: Accompaniment plays a critical role in improving the safety, dignity, and emotional resilience of abortion seekers, especially in restrictive and stigmatizing environments like Cameroon.

Strengthening training for providers, increasing public awareness, and integrating psychosocial and post-abortion care into SMA support can improve outcomes and reduce unsafe abortion practices.

EPLB016

Social determinants and prevention strategies in the HIV epidemic: NCHHSTP database analysis

E. Ekarika[1,2], C. Iheagwara[3], A.T. Amadi[4], P.C. Ezeamii[5], M.O. Oluwalana[6], L.C. Ihuoma[7], O.H. Nnabude[8], N.S. Gopep[9,10], O.E. Okobi[11,12], N.B. Emejuru[13]

[1]Emory University, Rollins School of Public Health, Atlanta, United States, [2]All Saints University School of Medicine, Medicine, Roseau, Dominica, [3]Saint Michael's Medical Center, Infectious Diseases, Newark, United States, [4]Enugu state university college of medicine, Family Medicine, Edmonton, Canada, [5]Georgia Southern University, Jiann-Ping Hsu College of Public Health, Statesboro, United States, [6]Memorial University of Newfoundland, Faculty of Medicine, St. John's, Canada, [7]University of Port Harcourt Teaching Hospital Rivers State, Internal Medicine, Portharcourt, Nigeria, [8]Windsor University School of Medicine, Dermatology, psychiatry, cardiology, internal medicine, family medicine, Houston, United States, [9]Georgia Southern University, Public Health, Statesboro, United States, [10]Federal medical center, Community Medicine, Keffi, Nigeria, [11]Larkin Community Hospital Palm Springs Campus, Family Medicine, Miami, United States, [12]Lakeside Medical Center, Family Medicine, Belle Glade, United States, [13]College of medicine, Imo state university, Psychiatry and Behavioral Sciences, Orlu, Nigeria

Background: The HIV epidemic remains a significant public health challenge, with social determinants and prevention strategies playing a crucial role in disease outcomes. While advancements in treatment and prevention have led to improvements in viral suppression and healthcare access, disparities in healthcare remain, particularly among vulnerable populations.

This study aims to analyze the role of social determinants in shaping the HIV epidemic and assess the effectiveness of current prevention strategies using data from the National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention (NCHHSTP) database. By examining demographic disparities, socioeconomic influences, and healthcare accessibility, the study seeks to identify key factors contributing to HIV transmission and treatment gaps.

Methods: This study utilized data from the NCHHSTP database, a comprehensive repository of surveillance and epidemiological data on infectious diseases in the United States. The study employed a cross-sectional design, analyzing retrospective data from reported HIV cases in the United States spanning from 2018 to 2022. The study population consisted of people diagnosed with HIV, as recorded in the NCHHSTP database. Data collection in the NCHHSTP database was performed through national reporting systems, healthcare facilities, and public health surveillance programs. Descriptive statistics, including frequencies and percentages, were utilized to summarize demographic characteristics and key variables. Bivariate analyses, such as chi-square tests and ANOVA, were conducted to examine associations between social determinants and HIV-related outcomes. A significance level of $p < 0.05$ was set for all statistical tests. Data analysis was performed using statistical software SPSS, ensuring robust analytical methodologies.

Results: The findings indicate a reduction in new HIV transmission and an increase in HIV prevalence, suggesting improvements in diagnosis and treatment. Although AIDS-related and HIV-related deaths spiked during the COVID-19 pandemic, viral suppression rates steadily improved. Healthcare access remained stable, with increased PrEP coverage and linkage to care. However, persistent barriers such as HIV stigma and unstable housing continued to affect health outcomes.
Conclusions: The study highlights significant progress in HIV prevention and care but underscores the need for targeted interventions addressing social determinants. Continued investment in equitable healthcare access, stigma reduction, and housing stability is essential for sustaining HIV epidemic control.

EPLB017

Displaced sexual minority men (SMM) experience more dignity attacks compared to local SMM in Ukraine

M. Mansouri[1], S.R. Friedman[5], B.P. Skaathun[3], J.O. Wertheim[3], I. Koutsenok[4], M. Filippovych[2], P. Smyrnov[2], T.I. Vasylyeva[1]
[1]UC Irvine, Population Health and Disease Prevention, Irvine, United States, [2]New York University, Department of Population Health, Grossman School of Medicine, New York, United States, [3]UC San Diego, Division of Infectious Diseases and Global Public Health, School of Medicine, San Diego, United States, [4]UC San Diego, Department of Psychiatry, San Diego, United States, [5]Alliance for Public Health, Kyiv, Ukraine

Background: Stigma against sexual minority men (SMM) is a known driver of HIV transmission. In Ukraine, which has one of Europe's largest HIV epidemics, it remains a public health challenge. The 2022 Russian full-scale invasion internally displaced millions, including SMM. This study explores how internal displacement relates to experiences of dignity attacks, which can maintain stigmatization and interpersonal hostility, and perceived reasons for these attacks.
Methods: We analyzed data from an on-going cohort study of SMM in two cities, Kyiv and Lviv, started in November 2024 (N=717 as of April 2025) that included local (n=348, 48.6%) and forcibly displaced SMM (fdSMM, n=368, 51.4%). The "Big Events" scale was administered to assess dignity attacks, measured by asking "How often have people spoken/acted towards you that felt like they were attacking your dignity?"
Bivariate logistic regression was used to assess displacement and dignity attack frequency (frequently, infrequently, never), and analyses were stratified by participants' financial situation.
Results: Overall, 48% (N=341) of participants reported experiencing dignity attacks in the last 6 months, 28% (N=201) frequently and 20% (N=140) infrequently; 36% (N=260) attributed them to their sexual orientation. Compared to local SMM, fdSMM had 1.25 times the odds of experiencing infrequent (95% CI [0.85, 1.85]) and 1.39 times the odds of frequent attacks (95% CI [0.99-1.96]). FdSMM were significantly more likely to report being demeaned for "everything about me" (OR = 1.94, 95% CI [1.22, 3.11]), "my personality" (OR = 1.62, 95% CI [1.10, 2.38]), and "my personal hygiene" (OR = 1.90, 95% CI [1.00, 3.61]. Among those "getting by" financially, fdSMM had 1.59 times higher odds of frequent attacks (95% CI [1.06, 2.41]).
Conclusions: Dignity attacks related to sexual orientation remain common in Ukraine. Being displaced may elevate vulnerability to dignity attacks among SMM, particularly when combined with financial instability. HIV prevention efforts in conflict-affected settings need to consider the intersectionality of SMM stigmatization.

EPLB018

Barriers to HIV, tuberculosis, and malaria service uptake among marginalized women and sexual minorities in Southwest Nigeria: a mixed-methods study

P. Bennett[1]
[1]TRAHI Nigeria, Lagos, Nigeria

Background: Despite improvements in Nigeria's health infrastructure, marginalized women including female sex workers, women living with HIV, and sexual minorities such as LBQ women and trans-women remain underserved in HIV, tuberculosis (TB), and malaria responses. Structural inequalities, stigma, and systemic exclusion continue to hinder their access to services.
This study investigated barriers to health service uptake among these populations in Lagos and Ogun States, Southwest Nigeria, to inform inclusive programming and advocacy.
Methods: A convergent mixed-methods design was used. Quantitative data were collected from 308 participants recruited through purposive and snowball sampling across urban and peri-urban areas. Structured surveys assessed awareness, service utilization, and barriers related to HIV prevention (including PrEP), TB diagnosis, and malaria prevention.
Qualitative data were gathered through 24 in-depth interviews (IDIs) and 8 focus group discussions (FGDs) exploring lived experiences with health systems. Additionally, 35 healthcare providers were surveyed on attitudes and perceived competence. Data triangulation was employed to enhance validity.
Results: Overall, 62.7% of participants reported experiencing stigma or discrimination in healthcare settings; 41.2% were misgendered, 36.8% denied care, and 49.5% treated judgmentally. Uptake of PrEP was low at 28.9%, TB screening at 35.7%, and consistent malaria prevention practices at 31.4%. Reported barriers included fear of discrimination (66.2%), lack of culturally competent providers (58.3%), misinformation about services (47.6%), and reliance on informal health networks (53.1%).
Healthcare providers acknowledged significant training gaps and highlighted the need for inclusive guidelines and peer-led interventions.
Conclusions: Marginalized women and sexual minorities in Southwest Nigeria encounter profound barriers to HIV, TB, and malaria service uptake, primarily driven by

stigma, discrimination, and limited provider capacity. Addressing these barriers requires peer-led navigation models, provider sensitization, legal reforms, and the development of inclusive health policies to advance equitable access.

EPLB019

HIV and mental disorders among people who use drugs in Côte d'Ivoire

M. Diomandé[1], A.M. Koua[2], F. Kouandé[3], M. Taillade Mélèdje[4], S. Aho Coulibaly[4]
[1]Médecins du monde, Medical coordination, Abidjan, Côte d'Ivoire, [2]Mental Health national program, Ministry of health, Abidjan, Côte d'Ivoire, [3]Médecins du monde, Medical Coordination, Abidjan, Côte d'Ivoire, [4]Médecins du monde, Harm Reduction Program for people who use drugs, Abidjan, Côte d'Ivoire

Background: Mental health challenges among people who use drugs (PWUD) living with HIV remain largely overlooked in health policies, even though their psychological well-being is weakened by structural factors such as stigma, poverty, drug use trajectories, institutional violence, and incarceration experiences. These challenges also negatively affect their access to HIV prevention, care, and support services.
Methods: To address this gap, a cross-sectional biobehavioral study was conducted in November 2023 among 954 PWUD in Abidjan, Bouaké, and San Pedro. Participants were recruited from seven high drug-use sites ("fumoirs") through exhaustive site-based enumeration. Mental health screening was carried out using the MINI diagnostic tool. Sociodemographic and drug use data were collected through structured face-to-face interviews. Descriptive and inferential statistics were used to identify patterns and associations.
Results: The prevalence of major depressive disorders was alarmingly high: 50% of participants suffered from current recurrent major depressive disorder, and 38% experienced isolated current episodes.
HIV prevalence among PWUD was 2%. Among them, 73% knew their HIV status. Among HIV-positive PWUD, 71.5% experienced current recurrent major depressive disorder and 28.5% had isolated depressive episodes. Among HIV-negative PWUD, 47% had current recurrent major depression, 45% had isolated episodes, and 8% presented with psychotic syndromes.
Depressive disorders were significantly associated with the use of crack (65%), heroin (57%), or psychoactive medications (75%). Economic hardship (50% earned less than 50,000 FCFA per month), being single (95%) or divorced (89%), and a history of incarceration (53%) were also strongly linked to mental health disorders.
Conclusions: These findings highlight the urgent need for integrated care models combining HIV services and mental health support, tailored to the specific realities of precarious PWUD. Community-based, individualized, accessible, and non-stigmatizing services are essential to improve access to care, reduce morbidity, and strengthen the HIV response among this vulnerable population.

EPLB020

"Hidden barriers, silent sufferers": gender, rights, and the reluctance of men to seek tuberculosis care in Thabo Mofutsanyane

M. Kibe[1]
[1]Civil Society Forum, Research Sector, Thabo Mofutsanyane, South Africa

Background: Despite South Africa's progressive TB policy landscape, men in rural areas remain disproportionately underserved, often disengaging from healthcare systems until advanced stages of disease. Thabo Mofutsanyane District in the Free State Province demonstrates high TB burden and poor male engagement, underscoring persistent health inequities.
This study aimed to identify human rights-related and gender-specific barriers that undermine men's access to TB care, contributing to delayed diagnosis, poor outcomes and increased community transmission
Description: Using a community-based participatory research model, this study engaged men aged 19 to 47 from rural villages across Thabo Mofutsanyane. Over six months (2023–2024), eight focus group discussions (FGDs) were conducted in Sesotho using semi-structured guides developed collaboratively with local civil society and health outreach teams. Transcripts were translated, coded, and analysed through participatory thematic analysis involving community researchers.
The study prioritized the ethical inclusion of marginalized voices and emphasized power-sharing in knowledge generation.
Lessons learned: Six interrelated themes emerged:
1. **structural health system failures**, including long waiting times and provider disrespect;
2. **perceived stigma** around TB and HIV diagnosis;
3. **socio-cultural norms of masculinity**, which discourage vulnerability and healthcare-seeking;
4. **economic precarity** and inflexible service hours;
5. **mistrust in health professionals**, rooted in prior negative encounters; and,
6. **digital opportunity**, with participants proposing WhatsApp-based peer support groups as low-cost, stigma-safe platforms. Despite high disease burden, health services rarely align with men's lived realities.
These insights reflect broader human rights failures: non-discrimination, dignity, and the right to accessible, acceptable care
Conclusions/Next steps: To realize rights-based, gender-equitable TB care, health systems must integrate differentiated, male-responsive models, including after-hours services, male peer educators, and integrated psychosocial support. CBPR emerges as a transformative tool to re-centre men's agency in care design. As TB elimination targets near, embedding community knowledge and dismantling gendered barriers is not only a scientific imperative but a moral one.
The findings call for scale-up of participatory mechanisms and structural reforms to align TB care with human rights principles.

EPLB021

Exploring the impact of healthcare provider attitudes on HIV, tuberculosis and malaria service uptake among marginalized women and sexual minorities in Southwest Nigeria

A. Adegbite[1], J. Ida Samson[2], D. Musibau[3]
[1]University of Ibadan, Institute of Child Health, Ibadan, Nigeria, [2]Strategy Management and Development Consultant, Abuja, Nigeria, [3]The Rainbow Alive Hub Initiative (TRAHI), Ikeja, Nigeria

Background: Marginalized women and sexual minorities, including female sex workers, LBQ women, and trans-women, face significant barriers to accessing HIV, tuberculosis (TB), and malaria services in Southwest Nigeria. These barriers are often driven by healthcare provider attitudes, including stigma, discrimination, and lack of cultural competence. Supported by the Global Equity Fund (GEF), this study aimed to assess the influence of healthcare provider attitudes on service uptake among these populations.
The objective was to identify key provider-related barriers and inform the development of inclusive, non-discriminatory healthcare interventions.
Methods: A convergent mixed-methods study was conducted between September and December in urban and peri-urban areas of Lagos and Ogun States, Southwest Nigeria. The study population included marginalized women and sexual minorities aged 18–49 years, recruited through purposive and snowball sampling techniques (N=308). Quantitative data were collected using structured surveys to assess healthcare experiences, perceived barriers, and service utilization patterns.
Qualitative data were gathered through 24 in-depth interviews (IDIs) and 8 focus group discussions (FGDs) with community members. Additionally, 35 healthcare providers completed surveys assessing their perceptions, competencies, and attitudes toward marginalized populations. Quantitative data were analyzed using descriptive statistics, while qualitative data were analyzed thematically to identify key barriers and service delivery challenges.
Results: Among participants (60% women, 40% trans or gender-diverse individuals, aged 18–49 years), 62.7% reported stigma or discrimination. Experiences included misgendering (41.2%), denial of services (36.8%), and judgmental treatment (49.5%). Service uptake remained low: PrEP use was 28.9%, TB screening 35.7%, and consistent malaria prevention 31.4%. Key barriers included fear of discrimination (66.2%), lack of culturally competent providers (58.3%), and misinformation (47.6%). Healthcare providers highlighted limited training and the need for inclusive service delivery protocols.
Conclusions: Provider attitudes substantially impact healthcare access for marginalized women and sexual minorities in Southwest Nigeria. Improving cultural competence through provider training, peer-led support models, and non-discriminatory service reforms is essential for enhancing HIV prevention, treatment, and care uptake among these populations.

EPLB022

"Mapping the journey of men affected by TB": human rights, gender norms, and community-driven responses in Lejweleputswa, South Africa

R. Matobako[1]
[1]Civil Society Forum, Law and Human Rights, Lejweleputswa, South Africa

Background: TB response continues to face critical gender gaps, with men experiencing delayed diagnosis, lower treatment initiation, and higher mortality compared to women. Despite their elevated burden, the lived experiences of men navigating TB care remain insufficiently understood in health system design.
This study applied a journey mapping framework to examine the social and structural determinants that shape men's help-seeking behaviour across the TB care continuum, with a particular focus on community support and human rights-based access.
Description: A qualitative study was conducted in Lejweleputswa District, Free State Province, a region with one of the country's highest TB incidence rates. Eight focus group discussions (FGDs) were held with 42 men aged 19–58 who had completed or were currently on TB treatment. Participants were recruited using purposive and peer-referral strategies from three primary healthcare facilities. Discussions, conducted in Sesotho, explored men's journeys across seven TB care stages: symptom recognition, help-seeking, diagnosis, initiation, treatment, retention, and post-treatment outcomes. Data were thematically analysed and visually mapped to capture turning points, barriers, and enablers.
Lessons learned: Men's TB trajectories are shaped by a matrix of gendered norms, human rights violations, and systemic neglect. Fear of stigma, cultural beliefs around masculinity, and harsh provider attitudes delayed early care-seeking.
Long queues, lack of privacy, and inconsistent counselling violated men's rights to dignified and confidential care. Crisis points often health deterioration or family pressure, served as involuntary entry points into the health system. Yet, peer-led support groups emerged as a critical turning point: they improved adherence, restored dignity, and transformed survivors into informal health advocates. Participants reported redefining masculinity around survival, responsibility, and community service.
Conclusions/Next steps: The findings underscore the urgency of human rights-based, gender-responsive TB programming. Interventions must ensure male-friendly, confidential, and accessible TB services while institutionalizing peer-led support structures.
Training health providers in rights-based, gender-sensitive care is essential. Journey mapping offers a replicable model to co-design TB interventions that reflect the lived realities and resilience of those most marginalized by gender-blind health systems.

EPLB023

Creating psychosocially safe spaces for youth in the HIV response: a mental health-centred, participatory approach in South Africa

R. Rensburg[1]

[1]*Best Health Solutions, Public Health, Johannesburg, South Africa*

Background: South Africa's youth remain disproportionately affected by HIV and related risk behaviors, including substance use, poor health-seeking behaviour, and loss to follow-up. Despite free public healthcare services, young people often disengage due to **low risk perception, stigma, and mental health stressors**.

This study explores how participatory, non-paternalistic engagement strategies centered on **mental health, psychosocial safety, and youth agency**, can improve youth uptake of HIV and NCD services.

Description: This qualitative inquiry was grounded in youth-led participatory action research methods and conducted across three peri-urban districts between 2022 and 2024. It involved 7 youth focus groups (n = 83), key informant interviews with health professionals and traditional healers (n = 13), and community mapping exercises facilitated by trained youth researchers.

The study aimed to understand barriers to engagement and design co-owned health interventions that address psychosocial and emotional realities.

Analytical frameworks included narrative inquiry and grounded theory approaches focused on emotional safety, risk perception, and treatment decision-making.

Lessons learned: Participants cited emotional unsafety, judgmental staff, and lack of relatable communication as key barriers to accessing HIV, TB, and NCD services. Many youth described public facilities as "hostile," lacking in empathy and space for vulnerable dialogue.

High-risk behavior, including drug use, was linked to unresolved trauma and absence of trusted adult or peer mentors. Services were seen as top-down, with little room for collaborative problem-solving.

Youth emphasized the need for **safe, non-judgmental spaces** to process health information, explore identity, and navigate emotional readiness for treatment. Collaborative sessions with traditional healers revealed untapped potential for **integrative care**, especially when rooted in mutual respect and health literacy.

Conclusions/Next steps: A mental health-informed HIV response must invest in **psychologically safe spaces**, youth facilitation training, and culturally respectful engagement models. Services must move beyond prescription to participation, where young people are not only recipients of care, but architects of how it is delivered. Integrating mental wellness with HIV prevention is critical to improving retention, adherence, and health equity.

EPLB024

Harnessing sports, arts and culture to address TB stigma and psychosocial barriers among men in urban South Africa: a mental health perspective

S. Dlamini[1]

[1]*Best Health Solutions, Public Health, Johannesburg, South Africa*

Background: TB remains a leading public health concern in South Africa, with men disproportionately underrepresented in testing, treatment, and support services. Beyond biomedical barriers, persistent psychosocial drivers, such as stigma, fear, isolation, and gendered norms of invulnerability, impede early engagement. While national campaigns exist, they often fail to resonate with male audiences or address the emotional and mental health aspects of TB.

This study explores the potential of sports, arts, and culture platforms to create psychologically safe, community-owned spaces for TB awareness and mental wellbeing among urban men.

Description: This qualitative study, conducted in Johannesburg from 2023–2024, engaged 87 male participants across three SAC hubs, using a phenomenological approach. Eight focus group discussions (FGDs) were facilitated through a semi-structured guide by community leaders from the SANAC Civil Society Forum's SAC Sector. Participants included community members. Discussions focused on TB knowledge, stigma, emotional coping, and the psychosocial impact of illness. Transcripts were thematically analyzed to identify mental health-related enablers and barriers in TB engagement.

Lessons learned: Five key themes emerged:

1. **internalized stigma and fear of judgment** hinder disclosure and care-seeking;
2. **lack of emotional support** exacerbates psychological distress during diagnosis and treatment;
3. SAC spaces offer **trusted, non-clinical settings** for mental health dialogue;
4. **storytelling, music, and sport** enable normalization of TB conversations; and,
5. peer support within SAC groups fosters belonging and resilience.

Participants expressed that health promotion through culturally rooted SAC platforms improved self-esteem, reduced isolation, and helped redefine masculinity around vulnerability and healing.

Conclusions/Next steps: Integrating TB awareness into SAC platforms offers a powerful mental health-responsive approach to reduce stigma, enhance emotional resilience, and promote help-seeking among men.

Public health strategies must embed culturally grounded, psychologically safe interventions in community settings. Co-designed SAC-based messaging, paired with mobile screening and referral services, can advance TB prevention while addressing the often-overlooked mental health dimensions of the epidemic.

Mpox oral abstracts

OAM01 Making impact with mpox: Epidemiology and medical countermeasures

OAM0102

Epidemiological profile of the early cases of mpox in Uganda, June 2024–January 2025.

L.O. Namakula[1], R. Migisha[1], J.O. Kobusingye[1], E. Mfitundinda[1], J. Nalwanga[1], E. Okiror Okello[1], A.M. Namusisi[1], B. Ainembabazi[1], D. Wenani[1], J. Kobusinge Lubega[1], H. Katumba[1], C. Mutesi[1], G. Abbo[1], P. Kwizera[1], B. Kwesiga[1], D. Kadobera[2], A.R. Ario[1]
[1]Uganda National Institute of Public Health, Field Epidemiology, Kampala, Uganda, [2]Division of Global Health Protection, Global Health Center, US Centers for Disease Control and Prevention, Kampala, Uganda

Background: Mpox was declared a Public Health Emergency of International Concern in July 2022, and reinstated in August 2024. Uganda reported its first confirmed case on July 24, 2024, and by December 15, 2024, >2,000 confirmed Mpox cases had been registered.
We described the epidemiology, exposures, and transmission dynamics among the early cases of Mpox in Uganda, to guide containment and control strategies.
Methods: All persons tested for Mpox in Uganda provided baseline information for a national line-list including: age, sex, residence, phone-contacts, occupation and symptoms. The National Rapid Response Team conducted case investigations on confirmed cases at isolation centers and in communities. Individuals with unreachable phone-contacts and not in isolation weren't interviewed. A confirmed case was a laboratory-confirmed Mpox infection in a resident of Uganda during June 1, 2024–January 22, 2025.
Results: By January 22, 2025, 2,209 laboratory-confirmed case-persons, including 13 deaths (case fatality rate=0.6%) were reported across 78 (53%) of the country's 146 districts, 6 reported >40 case-persons per district. Kampala District was the most affected, accounting for 1,205 (55%) case-persons, with an attack rate of 64 per 100,000 population. Most (1,259, 57%) were males, and the mean age was 27 (±11) years, ranging from 0 to 80 years.
A total of 424 (19.4%) confirmed cases provided occupational data, most of whom were students (10.8%) and female sex-workers (9.9%). Three hundred (13.6%) confirmed-cases were fully investigated, of which 71(23.7%) had chronic illnesses with most 60 (85%) living with HIV.
Exposure was established among 120 of the 300 fully investigated case-persons, most (72, 61%) contracted Mpox through sexual contact, primarily driven by sex-work. Most (n=82, 41%) of the first 200 Mpox case-persons sought care at private health facilities, where 85.6% (70/82) were misdiagnosed.
Conclusions: The Mpox outbreak in Uganda predominantly affected young adults, with a significant proportion of the early case-persons seeking care at private health facilities, where misdiagnosis was common. Most of the 300 fully investigated case-persons acquired Mpox through sexual transmission, mainly through sex-work. To effectively interrupt transmission, we recommended targeted strategies such as vaccination, including high-risk categories such as sex-work networks, and improving surveillance especially within private health-facilities.

OAM0103

From displacement to disease: unpacking the syndemic interplay between HIV and mpox among refugees in South Western Uganda

U. Muhumuza[1], E. Surafel[2], Z. Nahumuza[3], M. Naturinda[4]
[1]Africa CDC, Kampala, Uganda, [2]Africa CDC, Addis Ababa, Ethiopia, [3]International University of Africa, Khartoum, Sudan, the, [4]Kampala International University, Kampala, Uganda

Background: The intersection of protracted displacement, weakening public health infrastructure, and emerging zoonoses presents a fertile ground for syndemics in refugee settlements. This study introduces and tests the Syndemic Amplification Hypothesis—that HIV and Mpox in humanitarian settings do not co-occur by coincidence but are biologically and socially intertwined, amplifying each other's burden through shared pathways of vulnerability.
We aimed to determine the prevalence, co-morbidity patterns, and social drivers of HIV and Mpox among refugees, with a focus on transactional survival sex, mobility, and breakdown of social norms.
Methods: A prospective cohort study was conducted between October 2024–March 2025 across Nakivale refugee settlements. We recruited 1,030 participants (aged 13–49) through multistage cluster sampling. Testing for HIV and Mpox was combined with behavioral surveillance. Participants followed for 6 months assessing incident Mpox diagnoses and HIV seroconversions.
Additionally, 24 digital life-history interviews conducted using participatory timeline mapping and ethnographic shadowing of 12 youth at risk. Multivariate logistic regression and Cox proportional hazards models identified risk predictors. Qualitative data analyzed using grounded theory.
Results: Baseline, HIV prevalence was 13.8% (18.6% female, 8.4% male). Mpox prevalence was 5.1% (72% adolescents aged 13–24). Among Mpox diagnoses, 47.2% were also HIV-acquired. Co-acquisition individuals had significantly higher risk of severe Mpox manifestations (OR: 3.9; 95% CI: 2.4–6.1) and longer healing times (median: 18 days vs. 9 days; p<0.001). Youth aged 15–24, 41.3% engaged in survival sex; condom access was consistently unavailable for 67%. Mobility across border regions (esp. DR Congo) was a significant predictor of Mpox incidence (HR: 2.7; p=0.004). Qualitative analysis revealed a breakdown of normative sexual boundaries, erosion of parental roles,emerging scarcity driven sexual economies. Social trust in health workers was low due to stigma and militarized quarantine enforcement during Mpox outbreaks.

Conclusions: Our findings demonstrate that Mpox is no longer merely a zoonotic spillover but part of a larger syndemic dynamic in fragile settings. Targeted interventions must integrate syndemic thinking—addressing the social conditions enabling pathogen co-propagation.
We recommend:
1. Integrated Mpox-HIV screening and case management,
2. Cross-border disease surveillance, and;
3. Creation of safe spaces for youth-centered care and sexual health education.

OAM0104

PROJECT trial: proactive regional orthopox genomic epidemiology and cross-regional outbreak tracking—a multinational investigation into mpox evolution, vaccine efficacy, and transmission dynamics across the Middle East

H. Tanaka[1], S. Yamamoto[1], G. Rahal[2], Z. Khalil[3], A. Abdel-Fattah[3], K. Nassar[4], Y. El-Hadidy[4], T. Sabry[4], F. Zaki[4], O. Khalil[4], L. Barakat[3], S. El-Gazzar[3], N. El-Shenawy[4], R. Background: Mpox cases have surged across the Middle East since 2023, raising concerns over viral evolution, reduced vaccine protection, and gaps in regional surveillance—particularly for people with HIV. The PROJECT Trial characterized viral adaptation, immunity durability, and outbreak dynamics in five Middle Eastern countries.
Methods: This prospective, multicenter cohort study enrolled 9,126 individuals (including 687 people with HIV [PWH]) from Saudi Arabia, UAE, Egypt, Jordan, and Lebanon over 18 months. Participants were stratified into: MVA-BN-vaccinated (*N=4,573*), prior-Mpox-exposed (*N=3,129*), and unvaccinated/unexposed controls (*N=1,424*), with HIV status documented for all. Full-length viral sequencing (every 8 weeks) prioritized PWH samples for adaptive mutation analysis. Humoral/cellular immunity (neutralization titers, IFN-γ ELISPOT) compared PWH (*n=687*) vs. non-HIV participants. Transmission modeling weighted HIV-specific risks (e.g., CD4 count <200) alongside contact-tracing and mass-gathering data.
Results: Clade IV-ME Mpox (41.3% prevalence) carries A27L-L205F mutation enhancing spread. Vaccinated groups showed 64% antibody decline (1:128→1:46; 1:98→1:29 in PWH), with 17.4% breakthrough cases (23.1% in PWH; aHR=2.21). T-cell responses dropped 32% (47% in PWH; $p<0.001$). R_0=1.72 (general) → 2.48 (mass gatherings), 28.4% linked to PWH super-spreading. Asymptomatic rate: 13.6% (6.3% in PWH). Hospitalizations 1.9× higher overall (3.2× in PWH). Variant detection delayed 6 weeks (22% PWH undiagnosed pre-hospitalization).

Finding	Data	Implication / Clinical Significance
A27L-L205F mutation	Enhances viral adhesion/entry	Increased the ability to spread may require updated vaccines or therapeutics targeting this mechanism.
Neutralizing antibody decline	64% drop (1:128 → 1:46) by 12 months post-vaccination	Current vaccines lose efficacy over time; booster doses may be needed for sustained protection.
Breakthrough cases	17.4% rate; aHR 2.21 if vaccinated >10 months prior (95% CI: 1.88–2.59)	Revaccination schedules should prioritize high-risk groups (e.g., immunocompromised, sexual health clinics).
T-cell response reduction	32% lower vs. Clade II (p=0.003)	Cellular immunity is compromised; vaccines may need adjuvants to enhance T-cell activation.
Increased transmissibility (R_0)	R_0=1.72 (baseline) → 2.48 (mass gatherings)	Targeted interventions (e.g., pre-event vaccination, testing) critical for concerts/festivals.
Asymptomatic transmission	13.6% of secondary cases	Silent spread complicates containment; contact tracing and PCR screening must be prioritized.
Higher hospitalization in vaccinated	1.9× higher vs. unvaccinated (Egypt/Jordan)	Breakthrough cases may present atypically; clinicians need training to recognize Clade IV-ME symptoms.
Delayed variant detection	Up to 6-week lag in Lebanon/Jordan	Investment in regional genomic surveillance is urgent to track emerging variants.

Table 1. Key Findings and Implications of Mpox Clade IV-ME

Domain	Virologic Feature	Population Impact	Countermeasure Gap
The ability to spread	• A27L-L205F mutation (↑ adhesion)	• R_0=1.72→2.48 in mass gatherings	• Current vaccines target ancestral strains
Immune Escape	• 32% ↓ T-cell response (p=0.003)	• 17.4% breakthrough cases (aHR=2.21*)	• No clade-specific boosters available
Transmission	• 13.6% asymptomatic transmission	• 6-week variant detection delays in Levant	• Limited PCR screening capacity
Clinical	• 1.9× ↑ hospitalization (vax vs unvax)	• Atypical symptoms delay diagnosis	• Clinician training outdated

Table 2. Mpox Clade IV-ME: Threat Assessment Matrix
*95% CI:1.88–2.59 for >10mo post-vaccination

Conclusions: Clade IV-ME Mpox exhibits enhanced spread (accelerated in PWH) and waning vaccine protection by 9–12 months (faster in PWH), urging updated boosters for high-risk groups. Silent transmission and surveillance gaps (notably in PWH) demand strengthened genomic tracking and HIV-inclusive outbreak responses during mass gatherings.

OAM0105

Efficacy of modified-vaccinia Ankara vaccine as pre-exposure and post-exposure prophylaxis against monkeypox sexual transmission in non-human primate model

C. Herate[1], A. Ferrier-Rembert[2], F. Relouzat[1], A.-S. Gallouët[1], Q. Pascal[1], H. Letscher[1], M. Cavarelli[1], N. Bosquet-Dereuddre[1], W. Gros[1], B. Delache[1], S. Langlois[1], H. Timera[2], F. Jarjaval[2], L. Bossevot[1], C. Ludot[1], C. Brua[3], M. Lechemia[2], O. Ferraris[2], N. Silvestre[3], R. Le Grand[1], J.-N. Tournier[4,2]

[1]Université Paris-Saclay, Inserm, CEA, Center for Immunology of Viral, Auto-Immune, Hematological and Viral Diseases (IMVA-HB/IDMIT), IDMIT, Fontenay-aux-Roses, France, [2]Institut de recherche biomédicale des Armées, Microbiology and infectious diseases department, Bretigny-sur-Orge, France, [3]Transgene SA, Illkirch Graffenstaden, France, [4]Ecole du Val-De-Grâce, Paris, France

Background: Two major monkeypox virus (MPXV) outbreaks caused by two distinct clades (I and II) were reported since 2022 causing a human infectious disease with unusual epidemiological and clinical features, notably an increase in human-to-human transmission via sexual route. This evolution underscores the need to reassess prevention and control strategies in the context of a sexually transmitted disease.

Methods: After establishing a mucosal transmission model of MPXV Clade IIb via the rectal route in cynomolgus macaques—which resulted in moderate disease characterized by skin lesions primarily in the genital area, localized proctitis, fever, and lymphadenomegaly—we evaluated the immunogenicity and efficacy of the modified vaccinia Ankara (MVA) vaccine administered in both a pre-exposure prophylaxis (PrEP) and a post-exposure prophylaxis (PEP) regimen against MPXV IIb rectal transmission.

We conducted a longitudinal follow-up of the animals, monitoring viral replication as well as antibody and T cell responses induced by natural immunity in convalescent animals previously exposed to MPXV.

Results: We demonstrated that two doses of MVA induce specific B and T cell responses against Clade IIb MPXV and elicit antibodies that cross-neutralize MPXV Clade I and II viruses. The MVA-PrEP immunization approach protects against subsequent Clade IIb MPXV rectal challenge with drastic decrease of viral load in different compartment including the genital tract. However, a single dose of MVA administered four days post-exposure, as recommended by authorities, failed to protect macaques against mpox disease. We also showed that the exposure of non-vaccinated cynomolgus macaques to clade IIb MPXV via the atraumatic rectal mucosa route induces productive localized infection in the rectum, followed by systemic dissemination and mpox disease, whereas previously MPXV-challenged animals are protected against a new exposure via the same route.

Conclusions: Our findings validate two doses of MVA-PrEP as an efficient vaccine protocol against mpox in the context of the current epidemics, including in cases of mucosal transmission. However, both protection and immunological response data indicate that MVA-PEP is not effective, as it failed to prevent MPXV production in the rectal or seminal fluids. These findings have a critical impact on outbreak management and highlight the importance of reevaluating MVA post-exposure prophylaxis protocols.

Mpox poster exhibition

TUPEM001

Safety profile of tecovirimat in Congolese mpox patients enrolled in a randomized controlled trial

M. Ngale[1], B. Nganga[1], A. Dilu[1], G. Kayembe[1], C. Tshimanga[1], H. Lonza[1], H. Mutombo[1], J.-L. Biampata[1], L. Dodd[2], O. Tshiani[3], P. Mbala[1], N. Ntamabyaliro[1], T. Lutete[1]
[1]National Institute of Biomedical Research, Kinshasa, Congo, the Democratic Republic of the, [2]National Institutes of Health, Bethesda, United States, [3]Leidos, Reston, United States

Background: Monkeypox (Mpox) is a zoonotic disease that has been endemic in the Democratic Republic of Congo (DRC) since it was first discovered in a 9-month-old Congolese infant in 1970. While the global epidemic is caused by clade II, the epidemic in the DRC is caused by clade I. Mortality varies between 0,1-10%, but multisystemic effects with disabling sequelae are feared. So far, there is no treatment approved on the basis of clinical trials. The FDA approved Tecovirimat for treatment of smallpox in adults and children under the "Animal Rule" i.e. based on animal studies. In the face of such a situation of lack of approved treatment, attention may focus on efficacy, to the detriment of safety, which is nevertheless crucial for the optimal use of the drug.
The PALM 07 study is a clinical trial conducted in the DRC to assess the efficacy and safety of tecovirimat in the management of MPOX. This publication evaluates the safety data collected during this study. The current study focuses on the serious adverse events that occurred during this study.
Methods: PALM 007 is a randomised, double-blind clinical trial conducted in the DRC from September 2022 to June 2024. Adult participants, including pregnant women, and children recruited in Tunda in Maniema Province and Kole in Sankuru Province were randomised to receive either tecovirimat or placebo in combination with optimal standard of care.
Results: Of the 597 participants enrolled in the study, 27 experienced serious adverse events, including 10 deaths, 9 of which were children. Of the 16 pregnancies monitored, there were 8 live births and 8 pregnancy losses: 5 foetal deaths in utero and 3 early abortions.
None of these adverse events were related to the investigational product, according to pharmacovigilance imputation analyses.
Conclusions: Although it has not shown superiority over standard treatment, Tecovirimat is safe. The study shows that the basic conditions of patients with MPox and concomitant diseases can lead to unfavorable outcomes and must be taken seriously.

TUPEM002

Mpox-IRIS in people with HIV: insights from a cohort in Rio de Janeiro, Brazil

M. Secco Torres da Silva[1], T. Netto[1], M. Oliveira Bastos[1], P. Silva Martins[1], B. Fabris Rendelli[1], J.P. Bortot Soares[1], M. Braga Mesquita[1], F. Sabec Fogueral[1], M.P. Diniz[1], I.C. Ferreira Tavares[1], E. Portela Nunes[1], S. Wagner Cardoso[1], T. Silva Torres[1], C. Coutinho[1], V. Gonçalves Veloso[1], B. Grinsztejn[1], INI-Fiocruz Mpox Study Group
[1]Fiocruz, Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

Background: Mpox was declared a public health emergency of international concern twice within two years. Brazil, heavily affected by the 2022 outbreak, reported severe outcomes among people with HIV(PHIV) and advanced immunosuppression. The role of Immune Reconstitution Inflammatory Syndrome(IRIS) in mpox pathogenesis remains insufficiently elucidated. This study examines PHIV and suspected IRIS-mpox in a cohort from Rio de Janeiro, Brazil.
Methods: Prospective cohort of PHIV diagnosed with mpox at INI-Fiocruz, a state-level referral center. We described participants' characteristics, identifying people with suspected IRIS-mpox, defined as clinical worsening of mpox-related symptoms following antiretroviral therapy (ART) optimization/initiation.
Results: Among 361 PHIV with mpox between June 2022-September 2024, 12.4% (n=44/356) had HIV-RNA viral loads (VL) higher than 1,000 copies/mL at mpox initial assessment.
Participants with unsuppressed VL were more frequently younger (median age: 31 (IQR:28,39) *vs* 35 (IQR:30,40) years, p=0.03), black/*pardo* (72.5% *vs*60.5%, p=0.04), had lower educational levels (primary/secondary: 70% *vs* 42.3%, p<0.01), lower CD4+ T-lymphocyte counts (<=350 cells/mm³: 43.9% *vs* 7.1%, p<0.01), higher number of mpox lesions (>50: 22.6% *vs*7.3%, p=0.02) and increased hospitalization rates (24.4% *vs* 9.8%, p=0.02).
Five participants had suspected mpox-IRIS, mostly ART-naïve (n=3/5) or reporting irregular ART adherence at the time of symptoms onset (n=2/5). All of them had CD4+ count below 200 cells/mm3 and HIV-RNA VL higher than 200 copies/mL.
All participants started or reinitiated ART after the onset of mpox and, following ART initiation/optimization, they evolved with worsening of mucocutaneous lesions (n=5/5), ophthalmologic symptoms (n=1/5) and pulmonary nodules (n=1/5). Tecovirimat and steroids were prescribed to four participants. The median time to mpox resolution was 107 days (IQR:94–123) (*Table*).
No deaths were reported among participants with suspected IRIS-mpox.

	HIV status (at mpox symptoms onset)	Clinical management information	Time from mpox onset to ART initiation/ optimization (days)	Time from ART initiation/ optimization to viral suppression (days)	Time from mpox onset to viral suppression (days)	Time from viral suppression to mpox lesion resolution (days)	Time from ART initiation/optimization to tecovirimat initiation (days)	Time from mpox onset to tecovirimat initiation (days)	Time from mpox onset to lesion resolution (days)
1	ART: Irregular adherence CD4+: 75 cells/mm³ VL: 11,377 cps/mL	Tecovirimat: Yes Steroids: Yes	40	9	49	76	-11	29	125
2	ART: Naïve CD4+: 84 cells/mm³ VL: 2,200 cps/mL	Tecovirimat: Yes Steroids: No	3	55	58	5	19	22	63
3	ART: Naïve CD4+: 104 cells/mm³ VL: 5,740 cps/mL	Tecovirimat: Yes Steroids: Yes	20	34	54	113	28	48	167
4	ART: Naïve CD4+: 85 cells/mm³ VL: 323,152 cps/mL	Tecovirimat: No Steroids: Yes	38	53	91	17	NA	NA	108
5	ART: Irregular adherence CD4+: 186 cells/mm³ VL: 238 cps/mL	Tecovirimat: Yes Steroids: Yes	2	32	34	71	19	21	105

Table. Clinical characteristics of PHIV and suspected IRIS-mpox

Conclusions: Mpox-IRIS may significantly influence the pathogenesis and prolonged course of mpox. Early ART initiation remains critical for immune recovery and viral clearance. Strengthening HIV care pathways with a focus on early diagnosis and ART adherence is essential for improving outcomes in mpox management.

TUPEM003

Prevalence and associated factors of post-traumatic stress disorder, depression and anxiety disorders among mpox survivors, Uganda, 2024

E. Okiror Okello[1], R. Migisha[1], J. Morukileng[1], I. Lukabwe[1], L. Bulage[1], E. Mfitundinda[1], J.O. Kobusingye[1], J. Nalwanga[1], C. Mutesi[1], P. Kwizera[1], A.M. Namusisi[1], J. Kobusinge Lubega[1], D. Wenani[1], H. Katumba[1], L.O. Namakula[1], B. Ainembabazi[1], G. Abbo[1], B. Agaba[1], V. Ntono[1], B. Kwesiga[1], A.R. Ario[1]
[1]Uganda Public Health Fellowship Program, Uganda National Institute of Public Health, Kampala, Uganda

Background: By December 30, 2024, Uganda had reported approximately 800 mpox cases across 53 districts, with Kampala Metropolitan Area (KMA) bearing around two-thirds of the burden. Most outbreaks neglect mental health. We assessed the prevalence and associated factors of anxiety, depression, and Posttraumatic stress disorder (PTSD) among mpox survivors in the most affected districts in Uganda.
Methods: This cross-sectional community-based study was conducted from February 1–28, 2025, using simple random sampling of survivors from Kampala, Mukono, and Wakiso districts. Anxiety and depression were assessed using the Hospital Anxiety and Depression Scale, while PTSD was evaluated with the PTSD Checklist DSM-5. Associated factors for each condition were determined using modified Poisson regression.
Results: We enrolled 385 participants with a median age of 29 years (IQR: 25–35), 60% of whom were female, and 35% were sex workers. The prevalence of anxiety was 11% (n=43; 95% CI 8%–14%), depression was 14% (n=53; 95% CI 11%–18%), and PTSD was 9% (n=33; 95% CI 6%–12%). Reduced anxiety prevalence was associated with being married/cohabiting (aPR=0.3, 95% CI 0.2–0.8).
Increased anxiety prevalence was linked to suffering severe mpox symptoms (aPR=3.9, 95% CI 1.7–9.2), staying >2 weeks in the treatment unit (aPR=2.2, 95% CI 1.1–4.6), experiencing stigmatization (aPR=3.2, 95% CI 1.5–7.0), and poor management at the treatment unit (aPR=2.9, 95% CI 1.1–7.6). Increased depression prevalence was associated with staying >2 weeks in the treatment unit (aPR=3.9, 95% CI 1.9–7.9), poor management at the treatment unit (aPR=2.4, 95% CI 1.3–4.2), suffering moderate (aPR=2.2, 95% CI 1.1–4.5) or severe mpox symptoms (aPR=3.9, 95% CI 1.7–7.6), and stigmatization (aPR=2.4, 95% CI 1.2–5.0).
Increased PTSD prevalence was associated with losing a household member to mpox (aPR=3.2, 95% CI 1.3–8.0), illness duration >2 weeks (aPR=1.9, 95% CI 1.0–5.3), severe mpox symptoms (aPR=19.1, 95% CI 2.4–150.2), and stigmatization (aPR=3.2, 95% CI 1.1–9.4).
Conclusions: Approximately 1 in 10 mpox survivors surveyed experienced a mental health disorder during the illness or recovery. These findings underscore the need for integrated mental health support in mpox outbreak responses to address the psychological impacts.

TUPEM004

Factors associated with mpox mortality in Uganda, 2024–2025

C. Mutesi[1], R. Migisha[1], G. Abbo[1], J. Wobusobozi[1], D. Kadoebera[1], D. Atim[2], A. Riolexus Ario[1]
[1]Uganda Public Health Fellowship Program, Uganda National Institute of Public Health, Kampala, Uganda, [2]Ministry of Health Uganda, Kampala, Uganda

Background: While Mpox typically presents as a self-limiting illness, it can lead to severe complications and fatalities. As of April 4, 2025, a total of 5,087 confirmed Mpox cases and 38 Mpox-related deaths were reported in Uganda. We set out to determine factors associated with Mpox mortality in Uganda from August 2024–April 2025.
Methods: We conducted a 1:4 unmatched hospital-based case-control study among Mpox individuals who were admitted to Entebbe and Mbarara mpox treatment unit (ETU). A case was a confirmed mpox patient whose death was attributed to mpox while controls were were the next four consecutive confirmed mpox survivors admitted to the treatment unit.
We reviewed medical records of the selected individuals and captured information on their sociodemographic, individual, and clinical characteristics in a structured questionnaire. Logistic regression was used to identify factors associated with mpox fatality. Common reference group analysis was conducted to identify specific comorbidities that increased the risk of death.
Results: We enrolled 38 cases and 152 controls. Mpox-related deaths were higher among females (54%), individuals with underlying medical conditions (74%), and those with HIV (68%). The odds of death were significantly higher in children aged ≤5 years (aOR 3.3; 95%CI 2.6–19), rural residents (aOR 21; 95% CI 5.03–84), patients with any co-

morbidity (aOR 14; 95% CI 5.2–38), those who had more than one sexual partner (aOR 13; 95%CI 4.7–35), and those who delayed care-seeking beyond seven days (aOR 3.4; 95% CI 1.4–8.3).
Among patients with comorbidities, persons living with HIV had six times higher odds of mortality compared to those without comorbidities (aOR: 6.2, 95%CI: 3.0–13). The odds were twice those who had HIV only for individuals with multimorbidity (aOR: 15, 95%CI: 3.6–65).
Conclusions: Mpox-related mortality in Uganda was significantly associated with age ≤5 years, rural residence, underlying medical conditions, particularly HIV and multimorbidity, having multiple sexual partners, and delayed care-seeking.
Strengthening timely healthcare access and targeted interventions for high-risk groups particularly in rural residents, those with multiple sexual partners and individuals with comorbidities could reduce mpox-related mortality.

TUPEM005

Healthcare seeking for mpox: results of an electronic survey among MSM in Mexico City

K.A. Marañon Solorio[1], C.M. Román Montes[1], R. Baruch Domínguez[2], B.E. Crabtree Ramírez[1], F. González Lara[1]
[1]Instituto Nacional de Ciencias Médicas y Nutrición „Salvador Zubirán", Infectious diseases, Mexico City, Mexico, [2]National Council to Prevent Discrimination, Mexico City, Mexico

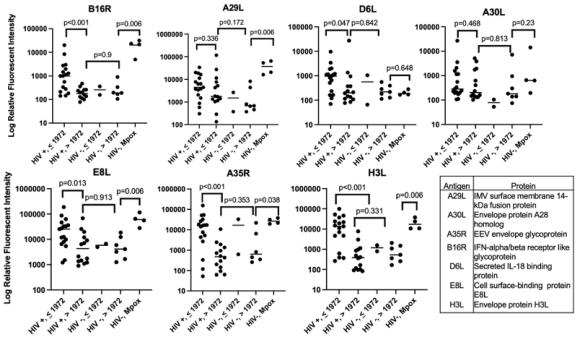
Background: In Mexico, the epidemiological data of the outbreak mainly came from passive surveillance, which meant a substantial limitation in knowing the actual prevalence and barriers to healthcare access.
Methods: A cross-sectional survey was conducted using an electronic platform to explore demographic data, experiences of stigma and discrimination, and changes in the sexual behavior of adult men who have sex with men (MSM) in Mexico City and the Metropolitan Area.
The questionnaire was adapted from the American Men's Internet Survey, the Libero-Pox survey, and Gómez-Castro J and peer-reviewed for comprehension and validation. The survey was distributed through social media between May and July 2023.
Participants were categorized as "Probable case" (PC-Mpox), defined as a person with skin or mucosal lesions in association with at least one of the following signs or symptoms: fever, myalgias, headache, lymphadenopathy, asthenia, arthralgias or low back pain or "Confirmed case" (CC-Mpox) defined as a "probable case" with a positive PCR test.
A descriptive analysis was made, and the PC-Mpox and CC-Mpox prevalence rates were calculated.
Results: A total of 419 participants were included. Median age was 33 years old, 94% (392) identified as cisgender men, 0.5% (2) as transgender men, and 6% (25) as non-binary. The majority 88% (369) identified as homosexual, followed by bisexual 8% (35), and 35% (146) declared living with HIV.29% (121) of participants presented at least one symptom, with 16% (66) meeting the PC-Mpox criteria and 11% (46) the CC-Mpox definition.
Attending meeting venues 85% (56) and substance use during sexual intercourse 61% (40), was more frequent in PC-Mpox (p <0.01) while condom use in the last encounter 30% (20) was less frequent (p <0.01).
Of the symptomatic population, 31% (38) did not seek healthcare, and a PCR test was performed only in 48% (40) of those who did. Discrimination was perceived in 28% (19) of the PC-Mpox who attended healthcare services.
Conclusions: In this survey, a third of the symptomatic population did not seek healthcare, underscoring the potential underestimation of Mpox cases in our context. Stigma and discrimination towards key populations may represent a significant barrier to access to healthcare in Mexico.

WEPEM001

Breadth and magnitude of humoral responses to monkeypox virus among persons with and without HIV

S. Mann[1], Z. Snyder[1], M. Al-Mafrachi[1], J. Axinn[1], J. Rausch[1], V. Sutton[1], N. Haakonsen[1], S. Fiorillo[1], R. Rapaport[1], T. Campbell[1]
[1]University of Colorado School of Medicine, Internal Medicine, Aurora, United States

Background: Little is known about humoral immune responses to the JYNNEOS mpox vaccine in people with HIV-1 (PWH). We hypothesized that after JYNNEOS, PWH would exhibit similar antibody responses to monkeypox virus (MPXV) proteins as persons without HIV (PWoH) and that persons with convalescent mpox or prior smallpox vaccination would demonstrate more robust antibody responses.
Methods: Adult PWH and PWoH were recruited from primary care and PrEP clinics. Vaccination history was obtained by interview and review of medical records. Plasma IgG binding to seven MPXV proteins expressed in HEK293 cells was measured by RayBiotech Mpox Virus Protein Array. Persons who received two doses of JYNNEOS 2-18 months before entry were considered vaccinated; those who had never received JYNNEOS were considered unvaccinated.
Birth before 1972 was considered a marker for prior smallpox vaccination. Intergroup differences in relative fluorescence units (RFU) for IgG binding were assessed by Mann-Whitney tests.
Results: 55 participants were enrolled: 31 PWH/vaccinated (median CD4+ 714/µL; 87% plasma HIV-1 RNA <20 c/mL), 9 PWoH/vaccinated, 4 PWoH/mpox, and 11 PWoH/no mpox or vaccine. Breadth and magnitude of IgG binding to MPXV proteins was similar among PWH/vaccinated and PWoH/vaccinated groups. Among PWH/vaccinated, birth before 1972 was associated with greater IgG binding to B16R (log difference 0.74 RFU), D6L (log difference 0.68 RFU), E8L (log difference 0.77 RFU), A35R (log difference 1.54 RFU) and H3L (log difference 1.55 RFU). Among PWoH, recovery from mpox was associated with greater IgG binding to B16R (log difference 2.07 RFU), A29L (log difference 1.74 RFU), E8L(log difference 1.09 RFU), and H3L (log difference 1.34 RFU) than vaccination.



Antigen	Protein
A29L	IMV surface membrane 14-kDa fusion protein
A30L	Envelope protein A28 homolog
A35R	EEV envelope glycoprotein
B16R	IFN-alpha/beta receptor like glycoprotein
D6L	Secreted IL-18 binding protein
E8L	Cell surface-binding protein E8L
H3L	Envelope protein H3L

Conclusions: HIV-1, controlled with antiretroviral therapy, did not affect humoral responses to JYNNEOS vaccine. PWH born in 1972 or earlier had greater humoral responses compared to PWH born after 1972. The greatest immune responses occurred after recovery from mpox.

WEPEM002

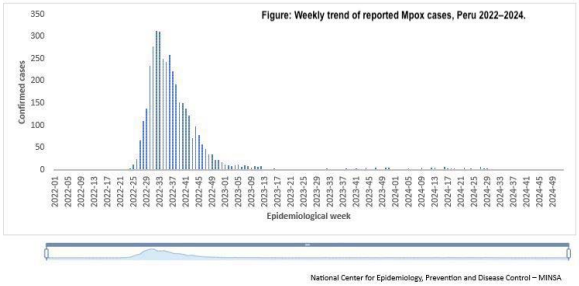
Mpox in Peru: assessing disease burden and the effectiveness of the national response

C. Benites[1], A. García[1], J. Olivera[1], N. Romero[1], A. Vera[1], K. Morales[1], M. Morales[1], E. Olortegui[1], A. Mendoza-Ticona[2], L. Lecca[2], C. Díaz-Vélez[3]
[1]Ministerio de Salud de Perú, Dirección de Prevención y Control de VIH, ITS y hepatitis, Lima, Peru, [2]Socios En Salud Sucursal Peru, Lima, Peru, [3]Ministerio de Salud de Perú, Dirección General de Intervenciones Estratégicas en Salud, Lima, Peru

Background: In mid-2022, Peru became one of the Latin American countries most affected by the global Mpox outbreak. The epidemic disproportionately impacted men who have sex with men (MSM) and people living with HIV (PLHIV), posing urgent challenges in rapid case detection, stigma-free communication, and integration of Mpox services into existing HIV programs.
Description: Between June 2022 and March 2023, Peru reported 3,864 confirmed Mpox cases—over 90% in Lima. Most affected individuals were men aged 20–49; approximately 60% were PLHIV.
All 21 reported deaths occurred among PLHIV. The Ministry of Health launched a comprehensive response including:

- Free, decentralized access to Mpox diagnosis and treatment.
- Rapid release of national clinical guidelines.
- Digital health campaigns targeting PLHIV and LGBTIQ+ communities via platforms like Facebook and Grindr.
- Partnerships with community-based organizations.
- Urban mobile outreach teams conducting case finding in LGBTQ+ settings, supported by peer counselors.
- Introduction of the MVA-BN vaccine for high-risk groups.
- Genomic surveillance to track viral clusters and lineages.

These measures led to a sustained decline in Mpox cases by early 2023.



Lessons learned:

- Early case detection through an innovative active case-finding strategy using urban mobile outreach teams.
- Early, inclusive engagement with affected communities was essential to reduce stigma and increase health-seeking behaviors.
- Integrating Mpox care into HIV services improved access and trust.
- Digital platforms can be powerful tools for targeted health messaging when culturally adapted.
- Transparent and targeted risk communication helped counter misinformation
- Public–civil society collaboration strengthened surveillance and case management at the community level.

Conclusions/Next steps: The Peruvian experience underscores the importance of a multisectoral, equity-focused approach to epidemic response.
Key factors in the successful containment of the Mpox outbreak included timely interventions, active community engagement through internet-based social networks, and tailored communication strategies. This model provides valuable insights for responding to future emerging infectious diseases in the region.

WEPEM003

Impact of vaccination amid armed conflict on the mpox epidemic in the democratic republic of the Congo, 2024–2025: a modeling study

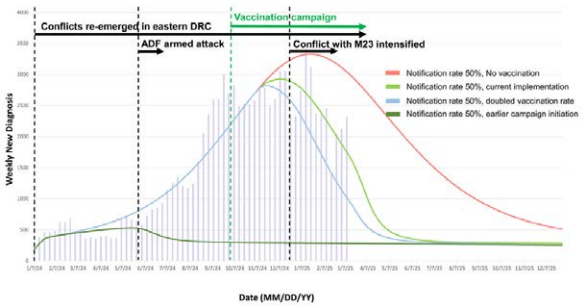
T.-W. Huang[1,2], Y.-C. Lin[2], C.-T. Fang[2]
[1]National Taiwan University, Department of Public Health, Taipei, Taiwan, Province of China, [2]National Taiwan University, Institute of Epidemiology and Preventive Medicine, Taipei, Taiwan, Province of China

Background: Since January 2024, the Democratic Republic of the Congo (DRC) has faced a rapidly escalating mpox epidemic, fueled by mixed transmission routes and the emergence of a novel clade Ib—associated with a higher case fatality rate than clade IIb, which dominated the 2022–2023 global outbreak. In August 2024, the World Health Organization (WHO) declared mpox a Public Health Emergency of International Concern (PHEIC).
This study aimed to provide early, policy-relevant estimates of the impact of a vaccination campaign initiated in October 2024 amid ongoing armed conflict.
Methods: We developed a deterministic, risk-structured transmission model incorporating zoonotic, household, and sexual human-to-human transmission. The model was fitted to WHO-reported mpox case data from Jan-

uary 2024 through March 2025. Vaccination data for first and second doses were obtained from UNICEF and other sources. Epidemic trajectories were projected through December 31, 2025, under scenarios with and without vaccination. Sensitivity analyses addressed uncertainty in case notification rates and asymptomatic proportions, and variation in vaccination rates and timing of campaign initiation.

Results: The model estimated a basic reproduction number (R_0) of 1.41 within a key population comprising 0.7% of the total. The vaccination campaign is projected to prevent 31.36% (19.87% – 39.71%) of cases and 31.18% (19.77% – 39.41%) of deaths by the end of 2025.

Doubling the vaccination rate could increase prevention to 38.72% (25.77% – 47.06%) of cases and 38.56% (25.69% – 46.80%) of deaths. A hypothetical campaign starting in January 2024 would have averted 79.64% (76.88% – 82.03%) of cases and 79.88% (68.87% – 82.19%) of deaths.



Conclusions: Despite operational challenges in a conflict-affected setting, the vaccination campaign is projected to substantially mitigate mpox transmission and mortality. Critically, earlier vaccine deployment could have averted the majority of cases and deaths.

These findings underscore the vital importance of timely and context-sensitive vaccination strategies to control emerging epidemics in humanitarian crisis zones.

WEPEM004

Uptake and adverse events following mpox vaccination rollout in Nigeria

E. Okpokoro[1], E.P. Ekele[1], R. Bello[1], O.S. Attah[1], A. Akigbogun[1], C.P. Obi[1], E. Kombu[1], O. Ayorinde[1], O. Nicholas[2], B. Abaye[3], A. Kolawole[4], A. Abdullahi[5], J. Onyemata[1], S. Adebajo[6], D. Tan[7], S. Mishra[7], J. Kwong[7,8], A. Abimiku[9,1], R. Audu[10]

[1]International Research Center of Excellence, Institute of Human Virology, Nigeria (IHVN), Abuja, Nigeria, [2]Federal Capital Territory Primary Healthcare Board, Abuja, Nigeria, [3]Bayelsa State Ministry of Health, Public Health, Yenagoa, Nigeria, [4]National Primary Healthcare Development Agency (NPHCDA), Abuja, Nigeria, [5]University of Cambridge, Department of Medicine, Jeffrey Cheah Biomedical Centre, Cambridge, United Kingdom, [6]University of Maryland, Baltimore, United States, [7]Unity Health Toronto, Division of Infectious Diseases, Toronto, Canada, [8]University Health Network, Department of Family and Community Medicine, Toronto, Canada, [9]Institute of Human Virology University of Maryland School of Medicine, Baltimore, United States, [10]Nigerian Institute of Medical Research, Yaba, Nigeria

Background: Mpox is a re-emerging public health threat, especially among individuals at high-risk such as healthcare workers (HW), men who have sex with men (MSM), and people living with HIV (PLHIV). Following the 2024 outbreak, Nigeria approved the JYNNEOS vaccine for prevention of Mpox. However, data on vaccine uptake and safety in these populations remain limited. We evaluated mpox vaccine uptake and adverse events following rollout in a high-risk Nigerian cohort.

Methods: This was a prospective cohort study with 4 visits of adults considered high risk and targeted for mpox vaccination by the National Primary HealthCare Development Agency (NPHCDA). Participants were enrolled from the Abuja and Bayelsa State between November 21 and December 6, 2024. Two doses of the JYNNEOS vaccine 28 days apart were provided. Following each dose, adverse events following immunization (AEFIs) were monitored daily for the first seven days and thereafter, weekly over 21 days, telephonically. Data were managed and analyzed with REDCap and R respectively.

Results: Of the 153 participants enrolled, mean age was 35±11years; 58% (89) were men, 40% (61) were women, and 2% (3) transgender individuals. Based on risk categories, 33% (50) were MSM/transgender individuals, 37% (56) were PLHIV, 35% (54) were HW, and 20% (30) were residents of Mpox-endemic communities. Some participants overlapped across the risk groups. Following the first dose, 80% (123) received the second dose. Uptake of the second dose was highest among HW (98%,53), followed by residents of endemic communities (80%,24) and MSM/transgender (78%,39), whereas PLHIV had the lowest uptake (68%,37).

Among study participants, 62% (95) reported an AEFI after the first dose, while 40% (49) reported an AEFI after the second dose. The most common AEFIs were injection site pain (65%,80), headache (15%,18), fever >38.5°C (12%,15), and malaise (11%,13). No serious adverse events were reported.

Conclusions: Mpox vaccine uptake and completion were high among individuals considered high-risk in Nigeria, though with mild AEFI confirming the safety of the JYNNEOS vaccine. Thus, targeted vaccination to high-risk population is strategic in improving uptake against emerging infections. However, innovative ways to maximize uptake of follow up dose are needed especially among PLHIV.

WEPEM005

Predictors and reasons for remaining unvaccinated against mpox in Australia in 2024: results from a prospective observational mixed methods study (2022–2024)

M. Hammoud[1], B. Bavinton[1], A. Smith[2], O. Sachs[1], F. Jin[1], V. Delpech[3], P. Read[3], R. Keane[4], R. MacIntyre[5], A. Grulich[1], TraX Study Investigators
[1]UNSW Sydney, Kirby Institute, Faculty of Medicine and Health, HIV Epidemiology and Prevention Program, Sydney, Australia, [2]UNSW Sydney, Centre for Social Research in Health, Sydney, Australia, [3]New South Wales Government Ministry of Health, Sydney, Australia, [4]Living Positive Victoria, Melbourne, Australia, [5]UNSW Sydney, Kirby Institute, Faculty of Medicine and Health, Global Biosecurity Program, Sydney, Australia

Background: Unlike other high-income countries, Australia experienced a resurgence of mpox in 2024 (n=1,408), with case numbers exceeding cases in 2023 (n=26) and 2022 (n=144). Of 2024 cases, 99.2% occurred in males. As of March 2024, vaccine coverage among gay and bisexual men (GBM) responding to community surveys was about 50%. We identified factors associated with remaining unvaccinated in 2024.
Methods: The TraX study was a prospective online-only cohort established early in the vaccine rollout in 2022 among GBM and their sexual partners. Weekly surveys measured self-reported mpox vaccine uptake.
Logistic regression analyses were conducted to identify predictors of remaining unvaccinated in April 2024. Adjusted odds ratios with 95% confidence intervals (aOR-,95%CI) quantified associations. Qualitative responses about decisions not to vaccinate were analyzed using the Framework Method.
Results: Recruitment began on September 28, 2022, enrolling 1,069 participants through social media and community organizations. Of these, 86.2% (n=922) completed a follow-up survey, and 44.2% (n=472) responded in 2024. Mean baseline age was 44 years. Most participants identified as cis men (92%) and gay (79%). By study end, 17% (n=81) remained unvaccinated.
Participants were less likely to be vaccinated if they lived in postcodes with fewer than 5.0% gay male residents (aOR:0.26,95%CI:0.12–0.54), were not living with HIV (aOR-:0.21,95%CI:0.05–0.96), or had not been diagnosed with a STI in the previous six months (aOR:0.27,95%CI:0.09–0.84). Additionally, lower uptake was associated with fewer COVID-19 vaccinations (aOR:0.67,95%CI:0.52–0.86), fewer casual male sex partners (aOR:0.43,95%CI:0.20–0.92), less participation in group sex (aOR:0.51,95%CI:0.28-0.93), less international travel involving sex with non-relationship male partners (aOR:0.49,95%CI:0.27–0.87), and lower concern about mpox (aOR:0.21,95%CI:0.08–0.54). Qualitative analysis (n=56) showed participants viewed their risk as low due to location, sexual behavior, and assumed immunity. Other reasons included healthcare inaccessibility, vaccine unavailability, side-effect concerns, and unclear vaccine information.
Conclusions: The vaccination rate in the cohort was higher than national estimates for GBM. Among those who remained unvaccinated, most made decisions consistent with perceived risk and public health messaging. However, some participants may have underestimated their risk based on behaviors reported. Addressing side-effect concerns, improving access to vaccination, and clarifying personal risk factors may help increase uptake.

THPEM001

Understanding the epidemiology, clinical characteristics and infection severity of mpox cases in 2024 outbreaks in Victoria, Australia

E.T. Aung[1,2], S.J. Low[3,4], J. Towns[1,2], C.K. Fairley[1,2], C.K. Lim[3,4], E.P. Chow[1,2,5]
[1]Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, [2]School of Translational Medicine, Faculty of Medicine, Nursing and Health Sciences, Monash University, Melbourne, Australia, [3]Victorian Infectious Diseases Reference Laboratory, Royal Melbourne Hospital, Doherty Institute for Infection and Immunity, Melbourne, Australia, [4]Department of Infectious Diseases, Doherty Institute of Infection and Immunity, The University of Melbourne,, MelbourneAustr, Australia, [5]Melbourne School of Population and Global Health, The University of Melbourne, Melbourne, Australia

Background: Following the global mpox outbreak in 2022, clusters of clade II mpox cases have continued to emerge in 2024 in many countries, including Australia. This study describes the epidemiology, characteristics, and severity of mpox cases presented to a public sexual health clinic in Victoria during the 2024 outbreaks.
Methods: We conducted a retrospective cross-sectional study of mpox-confirmed cases at the Melbourne Sexual Health Centre, Australia between January and September 2024. We collected data on demographic characteristics, sexual behavioural data, and vaccination history, clinical characteristics, and infection severity. We examined the factors associated with mpox clinical severity (mild, moderate, severe) using multinominal logistic regression.
Results: We included 156 mpox confirmed cases (155 men and 1 woman) with the median age of 35 (IQR: 31-40), and most were men who have sex with men (MSM) (98%, n=153). More than half (59%, n=89) had at least one mpox vaccine. Mpox vaccination was highest in pre-exposure prophylaxis for HIV (PrEP) users (73%, n=65), followed by persons living with HIV (PLHIV) (19%, n=17), and HIV-negative non-PrEP users (8%, n=7). One person had a previous mpox infection in 2022.
Most (92%, n=143) had mild or moderate symptoms, and 8% (n=12) had severe symptoms with 8 men requiring hospitalisations. One was lost to follow-up. Unvaccinat-

ed cases had higher mean number of lesions (n=8) compared to vaccinated cases (n=5, p=0.013). Vaccinated cases (n=89) had lower odds of severe disease than unvaccinated cases (n=64) (odds ratio[OR]: 0.22, 95%confidence interval [CI]:0.06-0.79, p=0.02). An increase in the number of lesions was associated with more severe disease (OR: 1.13, 95%CI: 1.05-1.23, p=0.002). PrEP use, HIV status, and age were not associated with clinical severity.

Conclusions: Our findings suggest mpox vaccination reduces disease severity. However, the notable number of unvaccinated PLHIV and non-PrEP users highlighted the need for increased awareness and public health campaigns to boost vaccine uptake among MSM to protect the community.

THPEM002

Epidemiology, clinical features, and outcomes of mpox in children and adolescents in Uganda, August 2024–January 2025

C. Mutesi[1], R. Migisha[2], L. Bulage[2], I. Lukabwe[2], D. Kadobera[3], A. Riolexus Ario[2]

[1]Uganda Public Health Fellowship Program, Uganda National Institute of Public Health, Kampala, Uganda, [2]Uganda Public Health Fellowship Program, Uganda National Institute of Public Health, Kampala, Uganda, Kampala, Uganda, [3]Division of Global Health Protection, US Centers for Disease Control and Prevention, Kampala, Uganda

Background: While Mpox has historically affected children in Central Africa more severely, recent outbreaks have shown varying epidemiological patterns across other regions. Our study aimed to describe the epidemiology, clinical features, severity, and outcomes of Mpox in children and adolescents in Uganda from August 2024 to January 2025.

Methods: We conducted a cross-sectional study among participants aged 0-17 with polymerase chain reaction (PCR)-confirmed Mpox. We reviewed medical records of all case-patients who received care from mpox treatment units in eight high-burden districts during the study. Data were collected on demographics, time to care-seeking, and caretaker occupation. Mpox severity was assessed using a standardized Mpox severity scoring system, and multivariable logistic regression was employed to identify factors associated with severe disease.

Results: We line-listed 160 cases: 51% were female; median (interquartile range) age was 8 (2-12) years. Eighty-nine (56%) were school-going children, and the case fatality rate was 3%. The majority (90%) were hospitalized but did not require intensive care. The median hospital stay was 5 (4–7) days. Most reported symptoms were rash (100%), fever (65%) and headache (27%). Lesions appeared mostly on the head/neck (86%), chest/abdomen (77%), and lower limbs (69%). Household (50%) and school (36%) were common exposure sources. Eighty (50%) case-patients experienced severe disease. Duration of hospital stay ranged from 4-7 days; 13 (8.2%) case-patients required intensive care and 3 (1.8%) died. Children U5 had higher odds of developing severe Mpox (adjusted odds ratio [aOR]=7.7, 95%CI: 2.1-28) than those ≥5 years. Care-seeking after 14 days was associated with higher odds of severity (aOR=15, 95%CI: 1.4-17).

Conclusions: Household and school exposures were key drivers of mpox transmission. Children U5 and delayed care seeking increased severity. Early detection and targeted interventions in homes and schools could reduce mpox-related morbidity and mortality.

THPEM003

Serosurveillance of immune response to mpox among men who have sex with men in Hong Kong

D.P.C. Chan[1,2], T.H. Kwan[1,2,3], S.S. Lee[1,2]

[1]The Chinese University of Hong Kong, S.H. Ho Research Centre for Infectious Diseases, Faculty of Medicine, Hong Kong, SAR of China, [2]The Chinese University of Hong Kong, Stanley Ho Centre for Emerging Infectious Diseases, Faculty of Medicine, Hong Kong, SAR of China, [3]The Chinese University of Hong Kong, Jockey Club School of Public Health and Primary Care, Faculty of Medicine, Hong Kong, SAR of China

Background: Monkeypox (mpox) has emerged as a global public health emergency of international concern since 2022, with the worldwide clade II mpox outbreak primarily affected men who have sex with men (MSM). In Hong Kong, there have been a total of 72 mpox cases to date, and free voluntary mpox vaccination with MVA-BN was offered to MSM with high-risk sexual behaviours. This study aimed to assess the durability of immune response to mpox after vaccination and the prevalence of asymptomatic mpox infection among MSM.

Methods: A cross-sectional mpox serosurvey was conducted between February and September 2024. Consenting MSM self-administered an online questionnaire on socio-demographics, smallpox and mpox vaccination history, sexual behaviours, history of sexually transmitted infections (STI) and mpox diagnosis. Blood samples were collected for the detection of antibody response against mpox virus (MPXV) A35 protein by ELISA.

Results: Totally 184 MSM completed the questionnaire and provided blood samples for immunological measurement of anti-A35R MPXV IgG. Among them, the median age was 32 years (interquartile range 28-39), 12 (6.5%) were living with HIV, and 26 (14.1%) had received previous smallpox vaccination. Overall, 68 (37.0%) were unvaccinated, 20 (10.9%) had received one MVA-BN vaccine dose, and 96 (52.2%) had received two doses. MSM who were currently taking PrEP (odds ratio [OR] 3.05; 95% confidence interval [CI] 1.41-6.61), reported ≥5 sexual partners (OR 2.46; 95% CI 1.33-4.55), engaged in group sex (OR 2.16; 95% CI 1.16-4.03), and diagnosed with STI in the past 6 months (OR 3.41; 95% CI 1.23-9.42) were more likely to be vaccinated (all $P<0.05$). Regardless of prior smallpox vaccination status, a decline in seropositivity for anti-A35R MPVX IgG from 36.3% (by 3-6 months postvaccination) to 26.9% (over 12 months) was observed among 116 MVA-BN vaccinees. Serological diagnosis of asymptomatic mpox infection was low, only three (4.4%, N=68) unvaccinated MSM demonstrated antibody response against MPVX.

Conclusions: The waning of immunity over time indicating that antibody response induced by mpox vaccine are short-lived and a booster dose may be needed.
Despite limited number of undiagnosed mpox infections, continuous serosurveillance would be essential for assessing transmission risk in the community.

THPEM004

Peer-driven mpox interventions: enhancing awareness, case detection, and vaccination among key populations in Kampala

G. Pande[1], H. Balidawa[2], P. Kyambadde[2], P. Mudiope[2], H. Kadama[2], L. Matsko[3], B. Kigozi[3], B. Lubwama[4], H. Kyobe[4], R. Mutumba[1]
[1]Ministry Of Health, Kampala Uganda, AIDS Control Program, Wakiso, Uganda, [2]Ministry Of Health, Kampala Uganda, AIDS Control Program, Kampala, Uganda, [3]MARPI, Programs, Kampala, Uganda, [4]Ministry Of Health, Kampala Uganda, Surveillance, Kampala, Uganda

Background: The current Mpox outbreak in Uganda has disproportionately affected Key and Priority Populations (KP/PP), especially sex workers, their clients, and people living with HIV. Although the Ministry of Health and partners implemented key measures such as enhanced surveillance, case investigations, and risk communication, these interventions initially failed to address the specific needs of KP/PP.
To fill this gap, the AIDS Control Program-KP/STI unit and its partners developed guidelines for integrating Mpox into HIV/KP programming.
As part of this effort, a three-month pilot was conducted in Kampala by the Most at Risk Population Initiative (MARPI), using trained peers and health workers to support interventions.
Description: As part of the response, 40 MARPI staff were trained as trainers of trainers over five days, 40 KP-led CSOs in Kampala were engaged in a one-day session, and 150 peers were trained over three days on Mpox symptoms, case identification, and risk communication. Additionally, 150 community gatekeepers (e.g., brothel owners, bar managers, and local leaders) received a one-day orientation.
From the trained peers, 30 were deployed across Kampala's five divisions, supported by two supervisors, to assist national response teams in the Mpox response.
Lessons learned: To strengthen the Mpox response among Key Populations (KPs) in Kampala, health teams and peer educators were formally introduced to Division Incident Commanders within KCCA . They actively participated in division-level coordination meetings to address local risks and align strategies. Peer-led outreach targeted hotspot areas frequented KP/PPs, reaching 131,707 individuals with risk communication messages.
This approach improved case detection, reporting, and contact tracing, with 746 suspected cases identified of which 598 tested positive for Mpox.
Additionally, the KP team supported the successful vaccination of 10,000 KP/PPs and contributed to increased community alerts and response efforts.
Conclusions/Next steps: Peer-led Mpox interventions in Kampala have significantly improved community engagement, case detection, vaccination, and awareness among Key Populations.
The next Steps will include: Strengthen coordination with local authorities, expand peer-led outreach and vaccination to other districts, Improve access to accurate information and services, address stigma and cultural misconceptions, ensure consistent supply of protective materials and monitor and adapt interventions based on community feedback

THPEM005

From clinics to communities; a social ecological analysis of mpox related-stigma in Nigeria

C. Osa-Afiana[1], G. Adebisi[1], C. Adirieje[1], E. Soje-Amadosi[1], G. Adebayo[1], A. Adetunji[2], P. Omonkhegbele[1], K. Yusufu[2], R. Okonkwo[1], M. Ati[3], S. Ibama[3], E. Onimoto[3], U. Adirieje[3], N. Sam-Agudu[4,1,5]
[1]International Research Center of Excellence, Institute of Human Virology Nigeria, Abuja, Nigeria, [2]Pediatric and Adolescent HIV Unit, Prevention, Care and Treatment, Institute of Human Virology, Nigeria, Abuja, Nigeria, [3]Afrihealth Optonet Association, Abuja, Nigeria, [4]Global Pediatrics Program and Division of Pediatric Infectious Diseases, Department of Pediatrics, University of Minnesota Medical School, Minnesota, United States, [5]Department of Pediatrics and Child Health, University of Cape Coast School of Medical Sciences, Cape Coast, Ghana

Background: Mpox related stigma contributes to delayed treatment and worsens health outcomes. In Nigeria, intersecting stigmas rooted in social identities amplify and hinder access to care.
The VERDI Nigeria study investigates how these intersections drive health inequities among individuals affected by mpox in four high burden states in Nigeria.
Methods: Rapid qualitative method was implored in this study from May-October 2024. Thirteen in-depth interviews (IDIs), 12 focus group discussions (FGDs), and 9 key informant interviews (KIIs) amongst healthcare workers (HCWs) providing care to mpox patients, adolescents, adults, pregnant women and caregivers of children diagnosed with mpox was conducted in the Federal Capital Territory (FCT), Bayelsa, Rivers, and Lagos States. Semi-structured interview guides were used to explore lived experiences of the participants.
Qualitative data was analysed using the Rapid Assessment Procedure (RAP) sheets guided by the social ecological model (SEM) and intersectionality framework.
Results: Of the 79 participants ; 58.2% (46) were female, 48 (60.7%) were HCWs with an average of nine years of experience in infectious disease units.
Findings revealed that mpox-related stigma was experienced at multiple levels- ranging from intrapersonal and interpersonal to clinic and community settings as seen in table 1.

Social Identities						
Social Ecological Levels	Types of Stigma Experienced	Category of Participants	Gender	Types of Residence	Occupation	Quotes
		Adolescent	Female	Peri-urban	Student	„I was depressed, became an introvert. It was like I should just die, because everyone avoided me."_IDI_Lagos
Intrapersonal (individual characteristics)	Internalised stigma Shame and helplessness led to isolation	Healthcare worker	Female	Urban	Infectious disease physician	„Other healthcare workers make discriminatory statement toward me because I work at the Infectious disease unit and treat mpox patients. As a result, I've stopped going to other departments in the hospital. I just come straight to my office here in the infectious disease unit, so I do not see anyone or interact with others."_KII_FCT
Interpersonal (peers, social networks & relationships)	Enacted stigma Stigma was manifested as discrimination from family, friends, and co-workers, leading to avoidance and fear of infection	Healthcare worker	NA	NA	Nurse (infectious disease unit)	„Once other HCWs see you, they say, you people should not come and infect us oh. Go to your department."_FGD_FCT „People are afraid of us because we work in the Infectious Disease Unit."_FGD_Bayelsa
Clinic Level (behaviours within health facilities)	Anticipated stigma Negative experiences with HCWs caused hesitation in seeking health care	Pregnant woman	Female	Rural	NA	„It was a terrible experience having mpox and being pregnant. The nurses treated me like I deserved mpox, segregated me and delayed treatment.I got tired and resorted to alternative medicine."_IDI_Lagos
		Caregiver	Female	Rural	NA	„Getting to the hospital where they treat mpox patients was difficult due to the distance, and upon arrival, HCWs blamed us, saying it was our fault that we didn't take care of our children well which is why they got mpox."_FGD_Lagos
Community Level (broader societal beliefs and practices)	Enacted and Anticipated stigma Differential treatment from neighbours and others led to perceived transgression	Adult	Female	Rural	NA	„I still feel stigmatized about mpox, even though I have been healed and better. Some of my neighbours still restrict their children from coming to me and playing with my children."_IDI_Rivers
		Healthcare worker	Adult	Rural	NA	„The street where the index case lived faced stigma—people vacated their houses until health officials stayed there for months to reassure the community."_FGD_Lagos

Table 1: Experiences of Mpox-Related Stigma Across Social Ecological Levels and Social Identities

NA- not applicable, this table summarizes the experiences of stigma at different social ecological levels, highlighting how intersecting social identities such as gender, occupation, and socio class shaped these experiences.

Conclusions: Intersecting stigmas create barriers to healthcare for mpox patients, worsening health and social disparities. Effective stigma-reduction strategies must be context-specific targeted at community, clinic, interpersonal, and intrapersonal levels by enhancing social support and improving health system practices.

Mpox E-posters

EP1109

Genetic evolution and mutation patterns in mpox virus lineages: a systematic review of genomic surveillance studies

P. Olaniyi[1], P. Agboola[1]
[1]Ladoke Akintola University of Technology, Medicine and Surgery, Ogbomosho, Nigeria

Background: Recent global outbreaks of mpox (monkeypox) have reignited global concern over its potential for sustained human-to-human transmission and cross-border spread. The 2022–2023 global outbreak, characterized by widespread transmission in non-endemic regions, has underscored the critical need for enhanced genomic surveillance. Understanding the genetic evolution and mutation dynamics of mpox virus lineages is essential for anticipating changes in virulence, transmissibility, and resistance to treatment.
Methods: We conducted a systematic review of genomic surveillance studies on mpox virus, covering publications from January 2017 to December 2024. We searched PubMed, Scopus, and GISAID using keywords such as "monkeypox," "mpox," "genomic surveillance," "mutation," and "phylogenetics." Inclusion criteria were: (1) studies presenting original genomic data (full or partial sequences); (2) studies performing analysis of mutation patterns, lineage evolution, or phylogenetics; and (3) studies based on human-derived samples. We excluded (1) purely theoretical or in silico studies lacking sequence data; (2) case reports without genomic analysis; (3) studies based solely on animal or environmental samples; and (4) reviews, editorials, or commentaries. Data were extracted on study location, lineage classification, mutation types, and phylogenetic methods.
Results: Of 73 studies screened, 28 met the criteria. Most analyzed clade IIb, especially the B.1 lineage linked to the 2022–2023 outbreak. Recurrent mutations were found in replication (F13L, E9L) and immune-related genes (B21R, B19R), with frequent APOBEC3-related signatures suggesting host-driven evolution. Phylogenetic analyses revealed increasing B.1 diversification and region-specific sublineages. Some novel mutations were noted, though none were conclusively linked to greater severity or vaccine resistance.
Conclusions: Mpox virus is undergoing genetic evolution, with emerging mutations suggesting possible adaptation to human transmission. Continued genomic surveillance is essential to track these changes and guide vaccine development, diagnostics, and outbreak response. Further studies linking genomic data with clinical outcomes are needed to clarify public health impacts.

EP1110

Neonatal mpox in Nigeria: a case of transplacental versus postnatal transmission

C. Onyeaghala[1], E. Alinnor[2], M. Irabor[2], J. Nongo[2], I. Diamond[2], C. Nnah[2], U. Azubogu[2], P. Nsirimobu[2], O. Maduka[3], P. Opara[2], R. Ugwu[2], D. Alasia[1]
[1]University of Port Harcourt Teaching Hospital, Internal Medicine, Port Harcourt, Nigeria, [2]University of Port Harcourt Teaching Hospital, Paediatrics, Port Harcourt, Nigeria, [3]University of Port Harcourt Teaching Hospital, Community Medicine, Port Harcourt, Nigeria

Background: Little information exists in the literature concerning the burden of mpox infection in the newborn population since the detection of the first case of human mpox over five decades ago.
Methods: A case study of a male full-term newborn who presented on the 29th of January, 2025, at the University of Port Harcourt Teaching Hospital, Nigeria, with suspected mpox. He was 4 days old on the day of his first skin eruption.
Results: The neonate presented with a febrile vesiculo-pustular rash syndrome characterized by a centrifugal pattern of distribution (marked on the scalp, face, neck, and limbs and sparse on the thorax and abdomen). There was a history of similar skin lesions in both parents. Vesicular fluid polymerase chain reaction testing done at the reference molecular laboratory, Rivers State University Teaching Hospital, confirmed the presence of monkeypox virus (MPXV) DNA and was negative for varicella-zoster virus. Despite the diagnosis of mpox in the early neonatal period with the high likelihood of a transplacental route of transmission, the possibility of a postnatal transmission could not be entirely ruled out. In line with the Nigeria Center for Disease Control and Prevention case management guidelines, he was optimized on supportive care, including nutrition, skin care, careful attention to fluid status and fluid management, blood transfusion, and targeted antibiotics by a multidisciplinary team of neonatologists, infectious diseases specialists, dermatologists and other experts in clinical medicine. While on admission, he developed bacterial skin co-infection with methicillin-resistant Staphylococcus aureus, prolonged illness, and eventually recovered from the illness following a delayed time to resolution of skin lesion of 48 days and a high rash burden (more than 100 lesions).
Conclusions: Neonatal mpox infection is rare and could lead to prolonged morbidity and mortality. Clinicians should always maintain a high index of suspicion and consider mpox in the differential diagnosis of a neonatal vesicular rash, particularly if there is a history of similar rash in the family and an endemic region, as early disease recognition and early treatment are associated with improved outcomes. Further studies are needed to better understand the transmission routes of the monkeypox virus in the newborn population.

EP1111

Screening of MPXV, VZV, HSV-1, and HSV-2 causing mucocutaneous vesicular rashes by multiplex HRM-PCR

R. Lumenbe-Numbi[1], P. Akil-Bandali[1], F. Cikaya-Kankolongo[1], C. Musuamba-Kayembe[1], E. Kinganda-Lusamaki[1], P. Mbala-Kingebeni[1], F. Muyembe-Mawete[1], M. Peeters[2], A. Rousseau[3], N. Picout[3], F. Durand[3], N. Nziza Trouchaud[3], P. Pourquier[4,3], E. Tuaillon[5], S. Henry[5], V. Foulogne[5], J. Guy[3]

[1]Institut National de Recherche Biomédicale, Kinshasa, Congo, the Democratic Republic of the, [2]Institut de Recherche pour le Développement, Montpellier, France, [3]AFYIA Diagnostics, Grabels, France, [4]Innovative Diagnostics, Grabels, France, [5]Pathogenesis & Control of Chronic & Emerging infections, Montpellier, France

Background: Since May 2022, over 27,000 monkeypox (MPOX) cases have been reported in Europe. In the Democratic Republic of Congo (DRC), MPOX has become a public health emergency, with 19,667 suspected cases and 575 deaths reported in 2024. The disease presents diagnostic challenges due to its similarity to infections caused by herpes simplex virus (HSV-1, HSV-2) and varicella-zoster virus (VZV). AFYIA Diagnostics developed the DIRASH kit, a qualitative screening test that simultaneously detects these viruses.

Methods: The DIRASH kit is a multiplex High-Resolution Melting (HRM) assay designed for the simultaneous detection of MPXV, HSV-1, HSV-2, and VZV. The DISoft™ software accompanying the kit automates the analysis and interpretation of HRM profiles. Its development resulted from a collaboration between researchers in France and the DRC, involving three clinical studies: one at CHU Montpellier (Jan 2021 - Dec 2022) during the clade II epidemic, and two at INRB in Kinshasa (Dec 2022 - Jun 2024) focusing on clades Ia and Ib.

Results: A total of 724 samples were retrospectively analyzed using the DIRASH kit and compared to the reference technology from the partner laboratory. In Montpellier, the DIRASH kit demonstrated 100% sensitivity for MPXV, 94% for VZV, and 98% for HSV-1 and HSV-2, when compared to the CHU's kit. At INRB, DIRASH showed 98% sensitivity for MPXV and 93% for VZV, in comparison with the simplex reference technology used at INRB, confirming the DIRASH kit's capability to detect multiple clades. Additionally, the kit identified previously undiagnosed co-infections (MPXV/HSV-1, MPXV/HSV-2, MPXV/VZV) with 100% specificity.

Conclusions: The DIRASH kit is a rapid, reliable, low-cost multiplex test with automated result interpretation. Its ability to detect viruses causing mucocutaneous vesicular eruptions is crucial for differential diagnosis in both the DRC and non-endemic countries, strengthening diagnostic capabilities and supporting epidemic control efforts.

EP1112

Role of fisherfolk and commercial sex workers in transmission of mpox during the early phase of the mpox outbreak in Nakasongola District, Uganda, September-November 2024

D. Wenani[1]

[1]Uganda National Institute of Public Health, Kampala, Uganda

Background: The Uganda Ministry of Health (MoH) declared the mpox outbreak on August 2, 2024, after two confirmed mpox cases were reported in Kasese District. On September 9, 2024, Nakasongola District registered its first confirmed mpox case. We described the epidemiological characteristics and transmission dynamics of confirmed mpox cases in Nakasongola District to inform interventions for other mpox outbreaks.

Methods: We investigated mpox cases by performing in-person structured interviews to obtain data on sociodemographic characteristics, exposures, signs, symptoms and contacts. We reported median age, proportions of the cases by age and occupation and calculated the attack rate of key demographics by determining the number of cases per population per 100,000. We constructed a transmission tree using Chainchecker™ application

Results: Between September 9 and November 28, 2024, a total of 66 confirmed cases were reported in Nakasongola. The majority of cases were male (n=36; 55%), with 49 cases (74%) occurring in individuals aged ≥18 years. The median age of the confirmed cases was 28 years. Nineteen out of 66 (29%) were fisherfolk and 7/66 (11%) commercial sex workers (CSWs). Attack rates were similar for males (28/100,000) and females (27/100,000), with the highest in those aged ≥18 years (41/100,000). Lwampanga Town Council had the highest attack rate (266/100,000). Five transmission clusters associated with sexual contact were identified. Fisherfolk and CSWs were sources of propagation and acquisition of mpox in three clusters.

Conclusions: CSWs played a key role in transmission and both fisherfolk and CSWs were at higher risk of acquiring mpox. Prompt isolation of mpox cases, along with targeted risk communication and community engagement efforts directed at these high-risk groups in the most affected town council may help prevent further spread to other sub-counties and town councils.

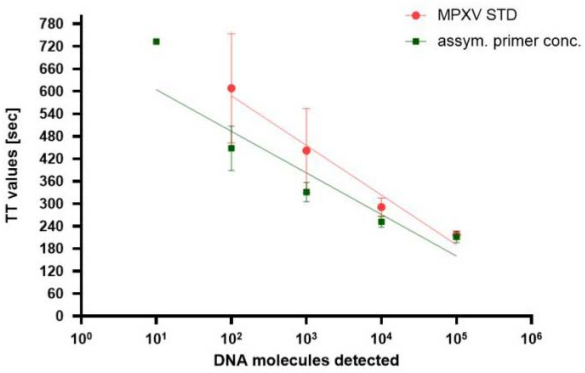
EP1113

A new IOT device for Rapid molecular testing for MPOX

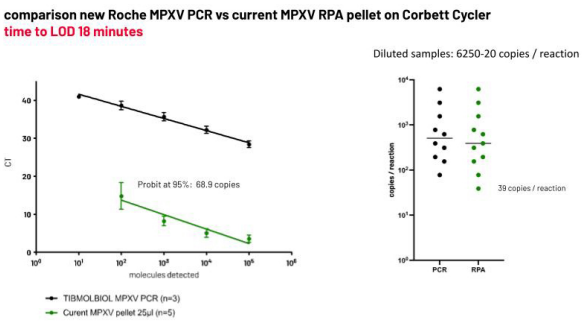
F. Arrey Takubetang[1], J. Bueno Alvarez[1], M. Szczygiel[1], Z. Kowalewska[1], R. Maja Kobialka[2], A. Ceruti[2], A. Abd El Wahed[2], M. Diebold[1], C. Wahnes[1], M. Weidmann[1,3]
[1]midge medical GmbH, Berlin, Germany, [2]Leipzig University, Institute of Animal Hygiene and Veterinary Public Health, Leipzig, Germany, [3]Medizinische Hochschule Brandenburg Theodor Fontane, Senftenberg, Germany

Background: There is a need for diagnostics that follow the suggestions put forth by the Lancet commission report on diagnostics (Fleming et al., 2021) and the REASSURED criteria (Land et al., 2019) not only for the African continent; but also worldwide. This is especially true for MPOX.

Methods: An easy to use platform that provides cloud based analysis of real time molecular amplification results to the user was developed. The biochemistry of choice, recombinase polymerase amplification (RPA) for monkeypox DNA had already been developed (Davi SD et al. 2019). To adapt the MPXV RPA to the minoo device asymmetric amplification was trialed.



Results: In order to assess the performance of the RPA pellet developed by midge medical the MPXV RPA was tested with this new pellet on a Corbett cycler in comparison to the TIBMOLBIOL MPXV PCR kit. A 25µl MPXV-RPA pellet reaction on the Corbett cycler yielded an analytical sensitivity of 10^2 copies detected per reaction and a probit 95% sensitivity of about 70 copies was calculated (n=5). When testing a 2-fold dilution series of the DNA standard ranging from 6250 - 20 copies / reaction 78 copies/reaction were detected by PCR and 39 copies/ reaction by the 25µl MPXV-RPA pellet.



Conclusions: The new asymmetric MPXV RPA pellet will now be fully adapted to the minoo device and should provide a highly sensitive test suitable for point of need testing in infrastructure poor settings but also for transmission control measures implemented to control spread such as airport checks.

EP1114

Mpox diagnosis and vaccination among gay and other men who have sex with men and transgender women in Brazil: results from a large nationwide online survey

T.S. Torres[1], M.S.T. Silva[1], P.M. Luz[1], C. Coutinho[1], B. Hoagland[1], E.M. Jalil[1], C. Pimenta[1], M. Benedetti[1], S.W. Cardoso[1], V.G. Veloso[1], B. Grinsztejn[1]
[1]Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil

Background: Mpox emerged as a global public health concern in 2022, disproportionately affecting men who have sex with men (MSM) and transgender women (TGW). Understanding the epidemiology and clinical characteristics of those reporting mpox diagnosis and vaccination is crucial for effective public health responses, particularly in resource-limited settings like Brazil.

Methods: We conducted a large-scale, cross-sectional online survey among MSM and TGW aged 18+ years in Brazil, recruited via dating apps and social media platforms (August-December 2024). Participants provided data on socio-demographics, sexual behavior, mpox diagnosis history, and mpox vaccination status.

We compared characteristics of participants reporting previous mpox diagnosis (yes/no) and mpox vaccination (yes/no) using chi-square tests.

Results: Among 7,043 participants (MSM: 99%; 18% aged 18-30 years; 24% secondary education or lower), 2.2% (n=152) reported previous mpox diagnosis and 5.1% (n=358) reported receiving mpox vaccine (1 dose: 46.1%; 2 doses: 47.8%; 2+ doses: 6.1%).

Of those diagnosed, 7.9% required hospitalization, 2.4% were not followed up by any health service, 7.9% reported engaging in sexual activity with mpox and 90.8% adhered to isolation.

More participants diagnosed with mpox (vs not diagnosed) reported higher education (post-secondary education: 84% vs 76%, p=0.016), self-identified as gay (88% vs 81%, p=0.045), living in a state capital (88% vs 77%, p=0.002), living with HIV (51% vs 26%; p<0.001), currently use PrEP (66% vs 29%; p<0.001), 5+ sexual partners in past 6 months (71% vs 39%, p<0.001), chemsex in past 6 months (57% vs 29%; p<0.001) and any STI in past 6 months (41% vs 14%; p<0.001).

More participants reporting mpox vaccination (vs not vaccinated) were older (30+ years: 86% vs 82%; p=0.05), self-identified as White (63% vs 56%; p<0.001), reported living with HIV (45% vs 25%, p<0.001), currently use PrEP (50% vs 29%; p<0.001), 5+ sexual partners in the last 6 months (51% vs 39%, p<0.001), chemsex in past 6 months (41% vs 30%; p<0.001) and any STI in past 6 months (20% vs 15%; p=0.03).

Conclusions: Mpox vaccination rates remain low among MSM and TGW in Brazil. Tailored strategies are needed to improve both vaccination coverage and clinical support for those affected and in higher vulnerability to mpox.

EP1115

Contact tracing and close relationship on handling 2023 mpox outbreak to MSM population in Jakarta, Indonesia

F. Haidar[1], R. Ridwan[1], N. Muryani[1], I. Praptoraharjo[1], A. Nugroho[2], B. Hegarty[3]

[1]University Centre of Excellence – AIDS Research Center Health Policy and Social Innovation, Atma Jaya Catholic University of Indonesia, Jakarta, Indonesia, [2]Lambung Mangkurat University, Banjarbaru, Indonesia, [3]The Kirby Institute, Sydney, Australia

Background: Mpox re-emerged as an outbreak in October 2023, with 59 confirmed cases in Indonesia, including 42 in Jakarta, between October 13 and November 26. Men who have sex with men (MSM), particularly those living with HIV, were identified as high-risk due to high-risk sexual contact transmission. In response to this, the Indonesian Ministry of Health and the Jakarta Provincial Health Office collaborated with community organization for MSM living with HIV to mitigate the outbreak.

This collaboration successfully curbed the transmission rate in Jakarta in December 2, 2023. Research on Mpox in Indonesia has focused mainly on clinical aspects, with limited exploration of public health responses.

This paper tried to explore the community-based response to Mpox.

Methods: We conducted a qualitative interview-based investigation to explore Mpox outbreak responses in Indonesia. Using respondent-driven sampling, we interviewed 21 participants, including vaccine recipients, NGOs, government officials, and community organizations. Interviews were conducted online and in-person between June and September 2024. Data were analyzed using an inductive thematic analysis approach.

Results: Community involvement in handling the Mpox outbreak started in identifying Mpox cases. The Indonesian Health Ministry and Jakarta Health Agency collaborated with community organizations to determine the most effective methods of communication and to identify necessary actions.

First, health workers and outreach workers were able to identify individuals at-risk through the existing HIV service system. They utilized routine visits for antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) to share Mpox information and testing.

Second, drawing from COVID-19 pandemic, Mpox contact tracing efforts employed rapid response mechanisms. Combined with the HIV service system, outreach workers facilitated safe disclosure and offer partner notification.

These made the overall healthcare experience more familiar. Last, the close relationship between outreach workers and health workers reduced the anxiety for accessing Mpox services, made them willing to disclose their health status and previous risky sexual behavior.

Conclusions: Community organization for MSM living with HIV leads to an effective response. Outreach workers and community organizations identified and reached at-risk individuals for Mpox infection, utilizing the existing HIV system, contact tracing, and the established relationship with health workers at primary healthcare.

EP1116

Otherness and blame: a comparative news media analysis of mpox outbreaks in Italy, Nigeria and the UK

D. Bilardi[1,2], M. Le Prevost[3], E.J. Nicholls[4], C. Osa-Afiana[5], A. David[4], S. Kandasamy[6], S. Collins[7], N. Sam-Agudu[5,8], S. Tariq[4]

[1]Penta Network, Padova, Italy, [2]University of Oxford, Primary Care Health Sciences, Oxford, United Kingdom, [3]University College London, MRC Clinical Trials Unit, London, United Kingdom, [4]University College London, Institute of Global Health, London, United Kingdom, [5]Institute of Human Virology, Abuja, Nigeria, [6]University College London, London, United Kingdom, [7]HIV I-base, London, United Kingdom, [8]University of Minnesota Medical School, Minneapolis, United States

Background: In 2022, a global Clade IIb mpox outbreak emerged, predominantly affecting Gay, Bisexual and other Men-who-have-sex-with-men (GBMSM). In 2024, Clade IIb outbreaks continued in the general population in West Africa and a new Clade I variant fuelled an ongoing epidemic in East and Central Africa. News media significantly influences public discourse during outbreaks. We compared Italian, Nigerian and UK news media representations of mpox across these different epidemiological and cultural contexts.

Methods: A total of 204 news articles, published from May 2022 to December 2023 in nine national newspapers across Italy, Nigeria, and the UK, were analysed. Research teams in each country conducted thematic analysis focusing on exclusionary narratives – specifically, attribution of blame and reinforcement of discriminatory cultural, sexual, and geographical boundaries.

Results: Italian and UK media frequently emphasised the African origin of mpox, reinforcing racist narratives that associate the Global South with contagion. Furthermore, the sexual behaviour of GBMSM was often homogenised and stereotyped, reflecting the stigmatising narratives and responsibilisation previously observed during the HIV pandemic. In contrast, Nigerian media rarely referenced GBMSM communities, and focused blame on rural populations or consumption of bushmeat. Additionally, religious and conspiratorial narratives framing mpox as either moral punishment or political manipulation were also prevalent in Nigeria. Across all three countries, first-hand accounts from individuals with lived experiences of mpox were notably absent from media content.

Conclusions: Exclusionary narratives have dominated news media coverage of mpox in both endemic and non-endemic countries. These narratives are deeply rooted in colonial legacies and historical stigmatisation associated with HIV, illustrating the persistent link between

contagion and notions of otherness in public discourse. Given the media's influence on global public health, there is an urgent need for a more inclusive, respectful, evidence-based and historically-informed when reporting future outbreaks to mitigate harm to marginalised and other affected populations.

EP1117

Rapid containment of an mpox outbreak, Uganda, Masindi prison, September-November-October 2024

J.K. Lubega[1,2], E. Mfitundinda[2], E. Okiror Okello[2], R. Migisha[2]
[1]Ministry of Health, AIDS Control Program, Kampala, Uganda, [2]Uganda Institute of Public Health, Surveillance, Kampala, Uganda

Background: We set off to investigate and contain a suspected Mpox outbreak in a high-risk prison setting. We focused in Masindi Prison, a high-security facility in Western Uganda, where overcrowding and poor hygiene posed a heightened risk for disease transmission.
The investigation aimed to identify the soucre and scope as well as generate evidence to strengthen surveillance to inform future outbreak preparedness and response in correctional settings.
Description: The response was implemented between Octover and November 2024. The prison was operating at over 150% capacity, with limited sanitation and inadequate space, making it highly vulnerable to disease spread. The target population included incarcerated individuals and prison staff.
A multi-sectoral structure coordinated by the Ministry of Health, Uganda Prisons Service, and Central Public Health Laboratories led the response.
We did retrospective case finding, clinical evaluation, laboratory confirmation through PCR testing, daily symptom screening, contact tracing, isolation of cases, improved hygiene and sanitation practices, restriction of inmate movement, risk communication, and training of health staff in Mpox identification and infection prevention protocols.
Lessons learned: The outbreak involved 28 cases, including two laboratory-confirmed, linked to detainees transferred from a community with suspected Mpox transmission. Misdiagnosis as chickenpox, combined with overcrowding and poor hygiene, enabled continued spread.
Once confirmed, urgent interventions were implemented including isolation of cases, daily symptom screening, mandatory bathing and disinfection, movement restrictions, onsite sample collection with rapid transport, risk communication for inmates and staff, and training for health workers.
These measures halted transmission, with no new cases after October and no deaths recorded. The response underscored the need for early detection, mandatory admission screening, and timely application of simple infection control practices, even in overcrowded, resource-limited settings. Multi-sectoral coordination was essential for rapid diagnosis, case management, and effective communication.
Conclusions/Next steps: This outbreak demonstrated that Mpox can be effectively controlled in high-risk settings through basic public health interventions when applied quickly and in a coordinated manner. Integrating correctional facilities into national disease surveillance systems and enforcing standardized screening protocols for new detainees are essential.
Future efforts should focus on strengthening prison health infrastructure and institutionalizing continuous infection prevention training to ensure readiness for emerging infectious threats.

EP1118

Stigma and coping mechanisms among mpox survivors in Kampala Metropolitan Area, August 2024–January 2025

J. Nalwanga[1]
[1]Uganda National Institute of Public Health, Kampala, Uganda

Background: On July 24, 2024, Uganda confirmed its first cases of mpox and has since had a gradual increase in the number of mpox cases as well as recoveries/ survivors. We conducted this study to determine the prevalence of stigma, associated factors and coping mechanisms among mpox survivors in the Kampala metropolitan area.
Methods: We conducted a cross-sectional study among mpox survivors that were diagnosed, treated and discharged during the first 6 months of the outbreak in Kampala metropolitan area. We used a mixed study approach to obtain stigma experiences using a structured interview questionnaire with an mpox stigma scale modified from the HIV stigma scale. We used an in-depth interview guide to explore coping mechanisms of survivors, collected data until saturation, coded and generated themes.
Results: We collected data from 346 participants of median age of 30 years (IQR, 25-30). Most (57%) were males, married (44%), attained secondary education (45%) and were business men/women (35%). The majority of the participants (66%) were admitted in hospital for one week or less. The prevalence of sigma was at 25% in this study. The majority of the participants 283 (82%) reported that their employment was negatively affected by having mpox. Most of the participants, 216 (62%) reported that they felt people with mpox were treated like outcasts. The prevalence of stigma was less in females compared to males (aPR=0.64, 95% CI: 0.44 – 0.92). A longer hospital stay was associated with an increased likelihood of stigma (aPR = 1.9, 95% CI: 1.3 –2.9). Participants utilized physical, psychological and social coping mechanisms towards mpox stigma.
Conclusions: The prevalence of mpox related stigma was low, mostly among men and was associated with increased hospital length of stay. Individuals applied social, psychological and physical mechanisms of coping. These coping mechanisms of mpox survivors underscore the relevancy of having a multidisciplinary approach to tackling stigma. We recommend further studies to evaluate the long-term outcome of such interventions.
